The lung of the warm blood animals is more complicated still. It may be likened, not to a grape, but to a bunch of grapes—indeed to several bunches of grapes. The unit corresponding to a single grape is called the *infundibulum*. That corresponding to a bunch is the *lobule*. Each *infundibulum* is intermediate in structure between the whole lung of the newt and that of the frog. It contains *septa*, but only primary *septa* (fig. 1c). These divide the margin of the *infundibulum* into a number of chambers, the *alveoli*. The interior of the *infundibulum* is, therefore, a sort of honeycomb, the *alveoli* corresponding to the cells of the comb; indeed, they are often called the *air cells*. In microscopical sections of the lung the *air cells* are cut across in all sorts of quite irregular ways, but the general appearance much resembles that of a section of a rather broken honeycomb (fig. 2).

Before birth the whole lung is folded up, the opposing walls of the *air cells* are in contact with one another and there is, of course, no air in the lung. Such a lung will sink if thrown into water, in which respect it is in marked contrast to the normal organ. It is one of the abiding mysteries of creation, that, when the new born child expands his lungs for the first time, the whole system of lobulae, *infundibula* and *alveoli* unfolds and fills with air. From that time onwards air is always passing into and out of the lung. The quantity taken in at each respiration is called the *tidal air* and is normally about 300–550 cu.cm. Of this about 150 cu.cm. never goes further than the respiratory passages; the remainder becomes mixed up with the air in the *air cells* (*alveolar air*) of which there is, perhaps, three litres in the lung. The following table gives the percentage composition of inspired and *alveolar air*:—

Component	CO ₂	N ₂	O ₂	H ₂ O (vapour)
Inspired air	0.04	79	20.94	1
Alveolar air	5.3	74.1	14.4	6.2

There are several ways of measuring the composition of *alveolar air*. That of Haldane and Priestley consists of blowing with extreme suddenness and force down a rubber tube about 5 ft. in length and about 1 in. in diameter. The air from the respiratory passages passes first along the tube and is washed out by the air from the deeper parts of the lung. If the subject has emptied his lung to the maximum the tube, or at least, the portion next to his mouth will contain pure *alveolar air*. Immediately after the expiration, the tube is closed with the tongue. To it, about 1 in. from the mouth, is fitted a vacuum sampling tube; by the opening of a tap a sample of the air in the *alveolar air* tube can be taken into the sampling tube for analysis.

Residual air is the volume of air remaining in the chest after the most complete respiratory effort. It ranges from 1,500–2,100 cu.cm.

Reserve or Supplemental Air is the volume of air which can be expelled from the chest after an ordinary quiet respiration—about

1,500 cu.cm.

Complemental air is the volume of air that can be forcibly inspired over and above what is taken in by normal inspiration and is 1,600–2,100 cu.cm.

Vital capacity is the quantity of air which can be expelled from the lungs by the deepest possible expiration, after the deepest possible inspiration. It obviously includes the complemental, tidal and reserve airs. The vital capacity of 73 Air Force pilots in the British army, tabulated by Col. Flack, varied between 5,500 cu.cm. and 2,800 cu.cm. Considerable importance is attached to the vital capacity as an index of the suitability of pilots for high flying. **Vital capacity** is measured by means of a *spirometer*, a graduated gasometer into which air is blown from the lungs.

FROM REPORT OF THE CHEMICAL WARFARE COMMITTEE (H.M. STATIONERY OFFICE)

FIG. 2.—SECTION OF A NORMAL LUNG OF GOAT (B) The termination of a small bronchiole

Lung Surface.—The whole surface presented by the walls of all the alveoli of a single human lung has been computed at about 1,000 sq.ft.; over the whole of this there is a compact network of capillaries, spread like a close pattern on a carpet. The blood in this vessel is separated from the air in the alveoli only by a membrane of almost inconceivable thinness.

Minute Volume of Blood.—The quantity of blood which reaches the lung in man is variously computed as being from 3–7 litres per minute during rest, and may be increased probably to 20 or 30 litres per minute or even more during exercise and in athletic persons. This blood comes from the right side of the heart, along the pulmonary artery, and parts with about 50 cu.cm. of carbon dioxide per litre in its transit of the lung. Simultaneously it picks up about the same amount of oxygen or rather more.

Provision, therefore, is required for air to ventilate the lung in sufficient quantity to carry off about 250 cu.cm. of carbon dioxide per minute during rest, and to supply about 300 cu.cm. of oxygen. Moreover this oxygen must be contributed without so far depleting the air itself as seriously to reduce the rate of diffusion.

In practice, the level of carbon dioxide in air of the alveoli is not allowed to rise above 5.5%, nor the oxygen to sink below about 14% at the sea level.

THE SUPPLY OF AIR TO THE LUNG

To accomplish these ends a ventilation through the respiratory system of about 7 litres of air per minute must be maintained during rest, which may be increased up to something like 100 litres per minute during violent exercise. The primitive method of ventilation is quite inadequate for the needs of warm blooded animals. The frog carries out the following routine: (1) it fills its mouth with air; (2) closes its nostrils; (3) forces the air in the mouth into the lungs, which become distended; (4) opens the nostrils and lets out the air so that the lung partially collapses.

FROM REPORT OF THE CHEMICAL WARFARE COMMITTEE (H.M. STATIONERY OFFICE)

FIG. 2A.—DIAGRAM OF BRONCHIOLE TERMINATION OF ATRIAL WITH INFUNDIBULA OPENING OFF

by which to ventilate the lungs. Their mechanisms are, however, very different, not to say contrary. The bird, like the mammal, possesses a trachea which branches into bronchi, but whereas in the vertebrate each bronchus supplies one lung and that alone, in the birds each bronchus leads not only to a lung but to a series of air sacs which ramify over a great part of the body, even penetrating the bones (see *Divericula* in fig. 3), which gives an idea of the size and situation of the air sacs. The function of the air sacs appears to the present author to be incompletely understood.

The following quotation expresses the state of knowledge on the subject:—

"In the bird the chest does not exist as a separate chamber. Expiration is effected by the thoracic and abdominal muscles,

AFTER C. HEIDER, IN SEDGWICK, 'STUDENT'S TEXT-BOOK OF ZOOLOGY' (ALLEN & UNWIN)

FIG. 3.—DIAGRAM OF THE LUNGS AND AIR SACS OF THE PIGEON

which compress the thorax and abdomen, driving the air from the air sacs, through the lungs and trachea. Inspiration is effected by the elastic expansion of the thorax and abdomen on relaxation of the muscles; this expansion causes an influx of air along the

FIG. 4

FIG. 5

trachea and lungs into the air sacs, the lungs being thus filled with fresh air." The above description, given by Marshall and Hurst, refers to the bird at rest; when flying the movements of the wings probably have an important effect on inflating and deflating the chest.

Mechanics of Respiration.—The mammal has elaborated a very special mechanism for the inhalation and exhalation of air.

By means of the diaphragm the portion of the body cavity which contains the lungs, the heart and the great vessels is shut off from the rest. The thorax is practically a closed box entirely filled by the lungs, heart and other structures contained within it. If we were to freeze a dead body until all its tissues were rigid, and then were to remove a portion of the chest wall, we should observe that every corner of the thorax is accurately filled by some portion or other of its contents. If we were to perform the same operation of removing a part of the chest wall in a body not first frozen we should find, on the other hand, that the contents of the thorax are not by any means in such circumstances bulky enough to fill up the space provided for them. If we were to measure the organs carefully we should find that those which are hollow and whose cavities communicate with the regions outside the thorax are all larger in the frozen corpse than in that which was not frozen. In other words the organs in the thorax are distended somewhat in order that they may completely fill the chest cavity; and the nature of this curious and important condition may best be illustrated by the simple diagrams figs. 4 and 5 (from Hermann's *Physiologie des Menschen*) where *t* is the trachea, *l* the lung, *v* the auricle of the heart, *h* the ventricle, *i* an intercostal space with its flexible membranous covering. When the interior of the vessel is rendered vacuous by exhaustion through the tube *o*, the walls of the lungs and heart are expanded until the limits of the containing vessel are accurately filled, while all flexible portions of the walls of the vessel (corresponding to the intercostal membranes of the diaphragm of the thorax) are sucked inward.

From this description it follows that the lungs, even when the thorax is most contracted, are constantly over-distended, and that when the cause of this over-distension is removed, the lungs, being elastic, collapse. It further follows that if the thorax is dilated, the flexible hollow organs it contains must perforce be still more distended—a distension which, in the case of the lungs, is followed by an indrawing of air through the trachea in all cases where the trachea is open. Thus, as the act of respiration is primarily a dilatation of the thorax, the part played by the lungs is, as Galen knew, a purely passive one.

How is dilatation of the thorax effected? It has been pointed out that the rib-planes decline from the horizontal in two directions, viz., from behind forwards, and from the antero-posterior mesial plane outwards; a glance at fig. 6 will make this double sloping clear to the reader. It has, moreover, been explained that the diaphragm arches upwards into the thorax in such a manner that the lateral parts of the arch are vertical and in contact with the inner face of the thoracic walls. This being the structure of the thorax, the enlargement of its cavity is brought about (1) by raising the rib-planes until they approach the horizontal, and (2) by depressing the diaphragm and making its rounded dome more cone-like in outline. A moment's consideration will show how these actions enlarge the boundaries of the thorax.

FIG. 6.—DIAGRAM SHOWING SLOPE OF RIBS

Nervous Mechanism of Respiration.—The chest, then, for purposes of respiration, consists of a box which dilates and contracts rhythmically; the actual rhythm is supplied by the nervous system. Physiologists are not agreed as to the precise rôle which the brain plays, but the following conception has much to recommend it. There is in the medulla oblongata a "centre," i.e., something analogous to a telephone exchange from which rhythmic messages pass down the nerves which connect it with the muscles of respiration. The principal nerves in question are the phrenic (4th cervical) nerves which supply the diaphragm and the

intercostal nerves which supply the intercostal muscles. If the mechanism consisted merely of this centre and the motor nerves which it operates, respiration would be of a very curious type; for, apart from controlling influences, the natural rhythm of the centre is one which produces a series of gasps at slow intervals. Pursuing the analogy of the telephone exchange, the particular centre immediately responsible for the primitive gasping type of respiration, and known as the "respiratory" centre, is of the nature of a local exchange and is governed by two other centres in the brain, each of which modifies the natural gasping rhythm. One such centre imparts an inspiratory bias to the gasping rhythm, so that the respiration of an animal possessing these two centres, and these only, consists of infrequent respiratory efforts between which the lung is distended and therefore full of air. The third centre in the brain imparts the smoothness and a rate which gives respiration a more normal character.

Even so, there are other influences which conspire to impart the usual rhythm to breathing. They come from without the central nervous system, and the most important of them arrive from the lung itself, along the vagus nerve.

As has been shown by Hering and Breuer, and by Head, at each phase of respiration a message is sent from the lung up the vagus. The precise nature of this message is unknown, whether it merely demands the termination of that particular phase, or whether it demands the initiation of the next, or both, is uncertain; the certain thing is that the change from inspiration to expiration (and vice versa) which would take place in time apart from vagus influences, is accelerated by them, so that respiration is more rapid and less deep with the vagi intact than with them cut. Animals will, however, live for a long time without their vagi, and when they die it is not because the power of respiration is deficient. Of the other nerves which lead to the brain, that which most influences respiration is the fifth cranial nerve, as is shown when strong ammonia is placed beneath the nose. The sensory nerves from almost any part of the skin, too, can influence

FIG. 7.—MODEL OF PAIR OF RIBS

respiration, as when cold water is suddenly dashed on to the surface of the body.

Types of Respiration.—The visible characters of respiration in man vary considerably according to age and sex. In men, while there is a moderate degree of upheaval of the chest, there is a considerable, although not preponderating, degree of excursion of the abdominal walls. In women the chest movements are decidedly most marked, the excursion of the abdominal walls being comparatively small. Hence we may distinguish two types of

respiration, the costal and the abdominal, according to the preponderance of movement of one or the other part of the body wall. In forced respiration the type is costal in both sexes, and so it is also in sleep. The cause of this difference between men and women has been variously ascribed (a) to constriction of the chest by corsets in women, (b) to a natural adaptation to the needs of childbearing in women, and (c) to the greater relative flexibility of the ribs in women permitting a wider displacement under the action of the inspiratory muscles.

In healthy breathing the mouth should be closed and the ingoing current should all pass through the nose. When this happens the nostrils become slightly expanded with each inspiration, probably by the action of the *M. dilatores naris*. In some people this movement is hardly perceptible unless breathing be heavy or laboured. As the air passes at the back of the throat behind the soft palate it causes the velum to wave very gently in the current; this is a purely passive movement. If we look at the glottis or opening into the larynx during respiration, as we may readily do with the help of a small mirror held at the back of the throat, we may notice that the glottis is wide open during inspiration and that it

becomes narrower by the approximation of the vocal chords during expiration. This alteration is produced by the action of the laryngeal muscles. Like the movements of the nostrils, those of the larynx are almost imperceptible in some people during ordinary breathing, but are very well marked in all during forced respiration.

GASEOUS EXCHANGE

The extent of gaseous exchange in man varies greatly with the size and age of the person, the degree of activity, etc.

	O ₂ consumption in cu. cm. per min. at 0° C and 76 mm. (Haldane)	CO ₂ production in cu. cm. per min. at 0° C and 76 mm. (Haldane)	Litres of air breathed per min. at 37° C, moist and at the prevailing barometric pressure
Rest in bed	237	197	7.67
Rest—standing	328	264	10.4
Walking on grass: 2 miles an hour	780	662	18.6
3 " " " "	1,065	902	24.8
4 " " " "	1,595	1,398	37.3
4½ " " " "	2,005	1,788	46.5
5 " " " "	2,543	2,386	60.9

The absolute minimum of oxygen consumption for any person is known as the basal metabolism and is that which takes place when the person is at rest in bed some ten hours after a meal. The basal metabolism in persons of different size, but otherwise comparable, varies not proportionately to the weight but to the body surface (see ANIMAL HEAT) and is therefore expressed in calories (*i.e.*, in units of heat produced) or in oxygen consumed per square metre of body surface per hour.

The basal metabolism varies with age, thus:

Mean age (years)	Basal metabolism per sq. metre per hour	
	Calories	Oxygen used litres (approx.)
6	57.5	11.7
12.6	59.4	10.3
13.7	49.4	10.1
15.5	43	8.73
19.25	40.7	8.30

In warm blooded animals the total ventilation varies with the size of the organism, being more intense the smaller the creature.

	Man	Goat	Rabbit	Guinea pig	Rat	Mouse
Total ventilation in litres per kg. per minute	.1	.2	.4	.6	1.5	5.1

The reason is as follows: The capacity for heat loss depends upon the superficial area of the animal. The heat production naturally must equal the heat loss; therefore the heat production must also vary with the superficial area, *i.e.*, in some way proportionally to the square of the linear dimensions on the animal. The weight, however, bears in proportion not to the square but to the cube; therefore, as the animal gets larger its area becomes relatively less proportionally to its weight, *i.e.*, the heat production, and therefore the degree of oxidation per gram of animal diminishes as the size increases. If the amount of oxygen required per gram of animal diminishes, the whole mechanism for its supply and therefore the total ventilation will diminish correspondingly.

The exchange of gases in the lung is regarded by almost all authorities as being a process of *diffusion*, the oxygen diffusing from the alveolar air through the pulmonary epithelium into the blood which circulates through the capillaries in the alveolar wall. (The most notable opponents of this view are Dr. J. S. Haldane, F.R.S., and some of those who have been associated with him. His views are fully set forth in his book *Respiration*.) The carbon dioxide likewise is regarded as passing by diffusion out of the

blood into the alveolar air.

Transport of the Oxygen.—Oxygen constitutes about 14% of the moist air which fills the pulmonary alveoli and therefore exerts a pressure of a little over 100 mm. of mercury. In order that blood exposed to so low a pressure should carry away any considerable quantity of the gas, it must needs be a fluid possessing very special qualities. These qualities blood owes to the red pigment in the corpuscles—haemoglobin. This material can unite with large quantities of oxygen at a pressure not exceeding 100 mm. of mercury and so leaves the lung charged with oxygen. But what is more remarkable—haemoglobin gives up this oxygen again when exposed to lower oxygen pressures. Thus, at about 30 mm. of mercury the blood surrenders one-half of the oxygen united to it; at 20 mm it gives up about three-quarters and so on. The curve which represents the relation between the quantity of oxygen united with the haemoglobin in blood, and the pressure of oxygen to which the blood is exposed, is called the oxygen dissociation curve.

There is one synthetic substance which attaches oxygen to itself if exposed to more than a certain critical pressure of that gas and from which the oxygen escapes if the oxygen pressure drops below the critical point—that substance which has recently been discovered by Prof. Moureu is rubrine, a complicated hydrocarbon. Though rubrine and haemoglobin seem to unite with oxygen after a manner not wholly dissimilar and, so far as other oxides are concerned, unique, they are otherwise not at all alike. Rubrine consists of three benzene rings united in a way not at present ascertained. Haemoglobin consists of a protein united with haematin, a substance which contains iron on the one hand and four pyrrol rings on the other. Moreover, it is clear from spectroscopic and other evidence, that the attachment of the oxygen to the haemoglobin has some relation both to the iron and to the pyrrol constitution of the substance. The constitution and properties of haemoglobin are of great theoretical importance because, but for it, the warm blooded animal could never have developed the high degree of vitality which he possesses. Oxy-

FIG. 8.—OXYGEN DISSOCIATION CURVES—ARTERIAL BLOOD AND VENOUS BLOOD (ADAPTED FROM HALDANE)
Ordinate represents percentage and saturation with oxygen, Abscissa, pressure of oxygen in mm. of mercury

gen is so insoluble in water that, apart from haemoglobin, blood could only carry to the tissues about one-sixtieth part of the quantity of oxygen which it does; therefore to maintain oxidation in the tissues at its normal level 60 times as much blood would have to circulate as at present. As the blood already forms one-fiftieth of the weight of the body, without haemoglobin it must needs form four times the weight of the rest of the body—an impossible burden. There are in the lower forms of life some respiratory pigments not altogether dissimilar from haemoglobin. In the blood of some worms, for instance, is found a ma-

terial chlorocruorin, which is really a form of haemoglobin, but possessed of a somewhat different scaffold of porphyrin. In some of the molluscs is found haemocyanin, also a protein body containing not iron but copper, and which, moreover, contains no porphyrin. These bodies like haemoglobin possess the power of condensing, transporting and yielding oxygen under suitable conditions. The exact affinity of haemoglobin for oxygen is an example of nice adjustment of the conditions under which the haemoglobin is found to the needs of the body. The affinity varies according to the saline concentration of the medium in which the haemoglobin is dissolved, according to the hydrogen ion concentration and according to the temperature. Moreover, there appears to be an assortment of haemoglobins specific to the forms of life in which they are found, and which have affinities for oxygen suitable to those forms of life.

Transport of the Carbon Dioxide.—Carbon dioxide, unlike oxygen, is carried largely in the plasma; a small quantity is in physical solution, but the major portion is in chemical combination as sodium bicarbonate. The relative quantities in solution and in chemical combination regulate the reaction (degree of acidity or alkalinity) of the blood. The equation which connects the concentration of hydrogen ions α_H to the concentration of carbon dioxide (CO_2) in solution, V_{CO_2} and in chemical combination B_{CO_2} is

$$\alpha_H = k_1 \frac{V_{\text{CO}_2}}{B_{\text{CO}_2}}$$

It is often expressed logarithmically as:

$$-P_H = P_{k_1} + \log V_{\text{CO}_2} - \log B_{\text{CO}_2}$$

To say that the carbon dioxide is present chiefly in chemical combination as sodium bicarbonate (NaHCO_3) gives but a partial picture of its relation to the blood. Such a combination by itself would be very stable, and while it might provide a medium of suitable hydrogen ion concentration would not present the all-important property of absorbing and parting with large quantities of carbon-dioxide with very little reaction and with very little alteration in the partial pressure of carbon dioxide to which the blood is exposed. This double property is achieved by the presence in the blood of other acids, notably haemoglobin, which do not unite with carbon dioxide, but which compete with it for the sodium. The full beauty of the mechanism is only seen, however, when it is realized that haemoglobin is a stronger acid in combination with oxygen than when reduced. Now in passing through the tissues the moment when the blood requires to unite with carbon dioxide is also the moment at which it loses oxygen; at that moment, therefore, the haemoglobin becomes less strongly acid, and a base is therefore liberated with which the carbon dioxide can unite. The reverse series of changes takes place in the lung. As the oxygen unites with the haemoglobin, that material becomes more strongly acid, claims more of the base, and so displaces carbon dioxide, raising the partial pressure of that gas and therefore assisting its diffusion from the blood.

Diffusion of Gases Through the Pulmonary Epithelium.—With this understanding of the chemical processes which enable large quantities both of oxygen and carbon dioxide to pass into and out of the blood, as the result of only very small alterations in the pressure of those gases in the medium to which the blood is exposed, let us return to the proof of the general thesis that the passage of gases through the pulmonary epithelium is due simply to diffusion.

The basal principle of diffusion is that the quantity of gas which passes through a given membrane depends upon the difference of pressure of the gas on the two sides of the membrane. Regarding the lung as a membrane through which gas diffuses, Q being the quantity of oxygen which will pass through it per minute, P the pressure of oxygen in the pulmonary alveoli, T the mean pressure of oxygen in the capillaries of the lung, and k a coefficient depending upon the area and nature of the lung, then

$$Q = k(P - T);$$

k may be defined as the quantity of gas in cubic centimetres which

will pass through the pulmonary epithelium per minute, with a difference of pressure of 1 mm. of mercury between the oxygen on the two sides of the membrane.

If the diffusion theory is correct, then not only must P be always greater than T , but their relations must be such as to allow of quantities of oxygen ranging from 200 cu.cm. at rest to perhaps 3,000 during extreme activity, being driven through the pulmonary epithelium per minute. As all the quantities Q , k , P and T are susceptible of independent measurement, it should be possible to form a judgment of the applicability of the equation. The simplest case is the condition of rest. The following measurements of k are given for 11 men, all of good physique at rest.

DIFFUSION COEFFICIENT OF LUNG CU.CM. OF O_2

Individual	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)	(11)
D. C. of L.	25	32	36	38	42	43	43	43	45	45	65

Assuming that each of these men was absorbing 250 cu.cm. per minute, the mean difference of pressure ($P - T$) between the oxygen in the alveolar air and capillary blood would have to be

MEAN DIFFERENCE OF PRESSURE IN MM.

Individual	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)	(11)
Mean	10	8	7	7	6	6	6	6	6.5	6.5	4

These figures lead to the conclusion that at rest the pressure of oxygen in the alveolar air exceeds the average pressure in the capillary blood by about 6 mm. of mercury in the majority of well-developed persons. The average pressure in the capillaries is, of course, less than the pressure in the arteries and greater than that in the veins. Other data known concerning the individuals on whom these experiments were made lead to the conclusion that 6 mm. for the value of ($P - T$) when Q is 250 cu.cm. may likely enough be correct. Greater difficulties arise when Q becomes, say, 2,500 cu.cm. during degrees of activity of which probably all the above persons would have been capable. If the diffusion coefficient still remains on the average 40 cu.cm. the value of ($P - T$) would become 62.5 mm. It is hardly possible that the pressure of oxygen in the lungs should exceed the average pressure in the capillaries by so great an amount. We are therefore thrown back upon the position that in violent exercise the diffusion coefficient must alter, and there seems little doubt that an alteration on a sufficient scale takes place.

The Regulation of Respiration.—When active exercise is taken both the depth and the rate of respiration are as a rule increased. The increase is effected by one or both of two mechanisms; of these the first to be considered is nervous, the second chemical. The nervous factor in the regulation of respiration has been well illustrated by the following experiment, devised by Krogh and Lindhart. The subject is placed on a bicycle ergometer of a special type, *i.e.*, a bicycle which, instead of progressing, is made to work against a brake, the actual work done being measured by the brake. In this case the brake was an electromotor, the resistance to the worker and hence the work which he performed in overcoming it could be regulated by adjustment of the current passed through the motor. When work was commenced there was an immediate increase in the rate of depth of respiration and also in the pulse rate. Had these alterations been due to the stimulating action of chemical products formed in the muscle on the respiratory centre, enough time must have elapsed to allow of the products being taken up by the blood, carried to the heart, passed through the lungs and driven to the brain. These processes would have occupied upwards of half a minute. In point of fact, the augmentation of respiration came about much more quickly—in about five seconds from the commencement of the exercise. An even more striking experiment of the same sort was the following: The apparatus being as before the subject was led to suppose that the load on the machine (and consequently the exercise he was to take) was to be suddenly and largely increased by throwing in a powerful current. Actually the current was not thrown in, though the pantomime of closing the switches,

etc., was gone through. The pulse and respirations were augmented as before, though no extra work was done by the subject. Clearly, therefore, the increased respiratory efforts were not due to chemical products produced by the work.

The chemical regulation of respiration was first clearly set forth by Haldane and Priestly, the demonstration of it following immediately on their discovery of a satisfactory method of determining the composition of alveolar air. The essential point emerged that at various altitudes which ranged between that of the top of Ben Nevis and the bottom of the Dolcoath mine, although the percentage of carbon dioxide in the alveolar air alters, the percentage becoming lower as the barometric pressure increases, the actual partial pressure of carbon dioxide in the alveoli and hence the concentration of that gas in the blood remains at such altitudes almost unchanged. This constancy of the pressure of carbon dioxide in the alveolar air means that the greater the barometric pressure the more the carbon dioxide produced by the body is diluted in the lung. As the carbon dioxide produced by the body is approximately constant in amount, the total ventilation of the lung, and hence the respiratory efforts must be greater the higher the barometer and the lower the altitude. Any effort to increase the carbon dioxide pressure in the blood, as by inhaling carbon dioxide or shedding it into the blood as the result of muscular exercise, has the effect of stimulating the respiratory centre and increasing the respiratory efforts more especially as regards the depth of respiration.

Controversy has ranged round the question of whether carbon dioxide is a specific stimulus to the respiratory centre, or whether its presence in the blood acts indirectly and, by increasing the concentration of hydrogen ions, stimulates the centre; the hydrogen ions and not the carbon dioxide acting as the stimulus. In favour of the latter view is the fact that after violent exercise, when the hydrogen ion concentration of the blood is increased and concentration of carbon dioxide diminished (lactic acid being present in considerable quantities), breathing may still be very laboured. It is certain also that, as shown by Winterstein, the administration of other acids to animals will cause dyspnoea (laboured breathing). On the other hand, other acids do not produce at all so striking an effect as carbon dioxide.

It is probable that CO_2 does act not specifically but by virtue of its power of increasing the hydrogen ion concentration in the brain; and that its potency in this respect is due to the ease with which it diffuses from the blood into the tissue of the brain itself. It is ultimately the hydrogen ion concentration inside the nerve cells which constitute the respiratory centre which would affect their stimulation—a fact which has been stressed by Gesell. According to his conception, if the activity of the respiratory centre is heightened as the result of nervous impulses playing upon it, the cells themselves will work harder, produce more CO_2 and undergo a sort of secondary stimulation. In the language of wireless, the original nervous stimulus will be "amplified." Similarly, if the carbon dioxide in the blood be increased, that produced by the cells will be unable to escape and will stimulate the centre.

In the above description it has been assumed that the irritability of the cells, i.e., the degree of response which any particular stimulus will provoke, remains constant. This is not so in all circumstances. Many drugs, such as morphia, depress the centre, but the most interesting case of altered irritability of the centre is that of oxygen want (see ANOXÆMIA). If the respiratory centre be insufficiently supplied with oxygen over considerable periods of time the irritability is heightened, a given amount of exercise will then produce a much greater degree of breathlessness than it evokes in normal circumstances.

Temperature has an important effect upon respiration. This is less marked in man than in animals, which do not sweat; if the dog or goat, for instance, lies in the sun, shortly the respiration will become very rapid and shallow, a great volume of air will pass in and out of its respiratory passages, but the amount of air which ventilates the alveoli is not correspondingly increased. This alteration in the type of respiration (tachypnoea) may, in part be due to rise in the temperature of the blood. If this blood,

as it passes through the carotid artery to the brain be warmed, tachypnoea results. But tachypnoea is probably also helped by a reflex nervous mechanism initiated by the actual heating of the skin, for it is claimed that the temperature of the blood may even be lowered. The purpose is clear. The heat loss is, of course, proportional to the amount of aqueous vapour which leaves the body, and the aqueous vapour in its turn is roughly proportional to the total ventilation. Therefore, by establishing a large total ventilation the body temperature is kept from rising, but if there were also a large alveolar ventilation the loss of carbon dioxide would be too great, the respiration being, however, shallow the alveolar ventilation is not greatly increased. (J. BAR.)

Tissue Respiration is the consumption of oxygen accompanied by the production of carbon dioxide that occurs on combustion of foodstuffs by the tissues. The complete combustion of carbohydrates ends with the uptake of oxygen and production of CO_2 in equal quantities giving a respiratory quotient ($\text{R.Q.} = \frac{\text{CO}_2}{\text{O}_2}$) of one. ($\text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2 = 6\text{CO}_2 + 6\text{H}_2\text{O}$). Combustion of fats and proteins give lower R.Q. values. Tissue respiration is measured according to methods devised by O. Warburg. Tissue respiration values, Q_{O_2} , Q_{CO_2} , are given as cubic millimetre per milligram dry weight per hour. The table gives values for respiration of rat tissues. Tissues of man give lower values.

Tissue (slugs)	Q_{O_2}
Retina	30.5
Kidney	15.0
Heart, ventricle	14.0
Brain	12.0
Liver	10.0
Submaxillary gland	10.0
Small intestine	10.0
Lung	7.7
Diaphragm	7.0
Skeletal muscle	4.0
Skin	5.0

Oxygen is transported from the lungs to the tissues by the haemoglobin of the red blood cells, a ferroporphyrin protein, which combines reversibly with O_2 (haemoglobin + $\text{O}_2 \rightleftharpoons$ oxyhaemoglobin). In muscle it is also transported by another pigment, myoglobin. Diffusion of oxygen from haemoglobin to the tissues and of CO_2 from the tissues to the blood is a rapid process regulated by the oxygen tension at the capillaries.

Since tissue respiration provides the energy necessary for the performance of cellular activities, respiration increases when the tissue is at work. The best example is muscle: at rest, respiration is low, 720 c.u.m.m. O_2 per gram per hour; during exercise it is increased threefold to fivefold. On the other hand, it has not yet been possible to measure the increase of respiration caused by brain activity. The increased oxygen requirement is met by an increase in the capillary bed, as shown by A. Krogh. In the resting organ relatively few of the capillaries are open; as the activity of the organ increases the number of open capillaries increases so that diffusion of oxygen to the tissues is greatly facilitated (for the mechanism by which the quantity of blood to organs is regulated, see VASCULAR SYSTEM). This process is also best seen in muscle. At the start of strong exercise the muscle, not having enough oxygen supply, is obliged to use fermentation (lactic acid formation) to provide energy for contraction, and an oxygen debt accumulates. After a time when the closed capillaries have opened and their surface is greatly increased, the oxygen supply becomes adequate and the lactic acid that accumulated disappears.

Tissues respond differently to changes in oxygen pressure, the brain and the heart being the most sensitive to low oxygen pressure (anoxia). Acute mountain sickness, which occurs on going to high altitudes, seems to be caused by the effect of anoxia upon the brain and the heart.

The combustion of foodstuff by oxygen is catalyzed by enzymes, which are systems—large in number—made up of a specific protein (dehydrogenase) and coenzymes (such as water-soluble vitamins of the B group—thiamin, riboflavin, niacin, pyridoxine, folic acid, pantothenic acid). Among these coenzymes riboflavin as flavoproteins, niacin as pyridine nucleotides, and iron-porphyrin-proteins as cytochromes and cytochrome oxidase perform the oxidation process, which is carried out step by step so as better to utilize the

energy produced on oxidation. This stepwise oxidation is illustrated by the oxidation of a phosphorylated sugar, glucose, 6-phosphate. It is oxidized by triphosphopyridine nucleotide (step 1); the reduced nucleotide is oxidized by a flavoprotein (step 2); the reduced flavin is oxidized by cytochrome C (step 3); reduced cytochrome is oxidized by cytochrome oxidase (step 4); and, finally, reduced cytochrome oxidase is oxidized by oxygen (step 5). Hydrogen peroxide, which is produced during oxidation of foodstuffs, is utilized by two iron-porphyrin enzymes: peroxidase, which catalyzes the oxidation of phenols and of aromatic amines by H_2O_2 ; and catalase, which catalyzes the oxidation of ethyl and methyl alcohols by H_2O_2 and also decomposes H_2O_2 into water and oxygen. Part of the energy provided by respiration is stored in the form of high-energy phosphate compounds, and part goes as heat. Tissue respiration is regulated by a number of factors, among which the hormones play the predominant role.

THE RESPIRATION OF INJURIOUS ATMOSPHERES

Carbon Dioxide.—Until within recent years it was supposed that carbon dioxide was harmful when inhaled even in small quantities. In any but the most recent textbooks the estimates of the quantity of air necessary for the efficient ventilation of a room are based on the assumption that the carbon dioxide present must not rise above a certain level. The figure usually given is 0.1%. This rule is probably not a bad one, but it is now known that carbon dioxide in such small quantities is quite innocuous and even in much greater quantities would have to be breathed before an injurious level was reached. Men can inhale 5% for some hours without suffering from much more than discomfort, and untutored persons would not be conscious of the presence of 2% of carbon dioxide in the air if it were otherwise pure.

The rule that the air of dwelling rooms should not contain more than 0.1% carbon dioxide is therefore useful, because air laden beyond that limit with carbon dioxide is also probably laden with other things to an injurious degree.

Meaning of "Ventilation."—Indeed the connotation of the word "ventilation" has been rendered somewhat vague by the more recent discoveries of science. If the use of the word be stretched to cover such sources of health as may be secured by the practice of opening the window, there are at least four such. (1) The removal of aqueous vapour; (2) the movement of air over the skin; (3) the removal of germs, and (4) the admission of ultra-violet rays of light.

Considering the above points, the benefits of ultra-violet rays are treated elsewhere (**LIGHT AND RADIATIONS IN RELATION TO HEALTH**). Here it is only necessary to say that ordinary window glass is relatively opaque to ultra-violet light and even specially manufactured glasses are often much less penetrable than is the open window. The beneficial effects of changing the air in a room on the disposition of germs has been demonstrated beyond dispute by experiments carried out by Leonard Hill. He dissipated a certain number of germs into a room with the windows shut; 20 min. later he exposed a plate of gelatine and found on it 39 germs. On a second occasion he dissipated the same number of germs into the room, opened the windows, and on exposure of the plate after 20 min. only one germ settled on it.

The advantage of keeping the air in motion may be illustrated by the following experience. On two successive days (on each of which the outside air was hot and still) a small over-crowded room was occupied for 8 hours by 11 typewriting clerks at work, a doctor and two experimenters. On the first day all avenues of ventilation were as far as possible closed, the chimney stuffed up, curtains put over the doors, etc., but the air in the room was actively circulated by electric fans. The percentage of carbon dioxide rose to about 2%. On the second day the fans were not in motion, but panes were abstracted from the windows. Chemical analysis showed that the air, though still, was pure. The stenographers who were unaware of the point of the experiment agreed

that the conditions were more tolerable the first day than the second, and examination of their work bore out that statement. The benefits of movement are probably due to two causes: (1) the actual stimulating effect of moving air passing over the skin, and (2) the fact that moving air evaporates moisture from the skin much more readily than still air. The relative importance of these factors probably differs much in different persons. The moral of the above experiment is not to disparage purity. It is to emphasize the necessity of combining purity with movement.

Carbon Monoxide and Coal Gas.—For the theory of carbon monoxide poisoning see ANOXÆMIA and BLOOD. Here it need only be said that the following are given as the percentages of carbon monoxide in the air which must be inhaled to produce the results stated.

Time and concentration =	300 or less, no perceptible effect
" " "	= 600, a just perceptible effect
" " "	= 900, headache and nausea
" " "	= 1,500, dangerous

In the above table time is measured in hours and the concentration in parts of carbon monoxide per million of air. The figures assume that the subject is at rest and inhaling about seven litres of air per minute. If he is active and therefore inspiring greater quantities of air, the time necessary to produce death or unconsciousness is cut down directly in proportion to the magnification of the quantity of air breathed per minute.

In practice it is not easy to attain the concentrations of carbon monoxide necessary to produce fatal results. The experiments of Haldane have shown that the walls of ordinary dwelling rooms are quite permeable to the gas. This fact, together with the gradual movement of air, even through ill-ventilated rooms, as a rule prevents dangerous concentration of carbon monoxide being maintained, even where there is a slight escape of gas.

High Atmospheric Pressure.—Where men work under water at considerable depth, it is necessary to supply them with air at a pressure as great as, or greater than, the combined pressure of the atmosphere and of the water under which they are working. Unless the pressure be very high this in itself has no injurious effects and men may go confidently and quickly into such pressures; great care, however, must be exercised in emerging from a high atmospheric pressure into a normal one. The danger is due to the nitrogen dissolved in the blood. The quantity of this gas held in solution in the blood depends upon the pressure of oxygen to which the body is exposed. Normally, each litre of blood holds about 15 cu.cm. of nitrogen; at depths of 33 ft. under water the pressure of air in the diving apparatus would be two atmospheres, in which case each litre of blood would hold 30 cu.cm. of gas in solution. As the gas is not removed by the formation of any chemical compounds with other materials in the body, when the pressure is lowered it forms minute bubbles of nitrogen in the plasma. These bubbles when carried to the capillaries form emboli. Indeed, the danger is not confined to the blood, for if the worker be long enough exposed to the high pressure, all juices which permeate all the tissues of the body become charged with abnormally large quantities of nitrogen which, when the pressure is reduced, renders itself evident by the formation of small bubbles. These appear in many situations in the body, notably in nerve cells in the brain and elsewhere. Such bubbles are the cause of the condition known as "bends" associated with pain and paralysis, which may be even fatal.

Chlorine.—The inhalation of chlorine in concentration of more than one part per million of air for an indefinite period is dangerous; for half-an-hour the maximum allowable is four parts per million; 40 to 60 even for short periods is dangerous. Chlorine is typical of a number of gases which produce inflammation of the lungs, death being due not directly to the gas, but to asphyxia. It is of particular historic interest as being the first gas used on a large scale as a lethal weapon in war; clouds of the gas being liberated from cylinders in the German lines were carried by the favourable wind over to the lines of the Allied armies, where it produced the most devastating effect. More potent asphyxiants than chlorine, but much less used in commerce, are phosgene

and chloropicrin. Other gases which act similarly are sulphuretted hydrogen, sulphur dioxide, nitrous acid and acid fumes.

Other Gases Having Deleterious Effects.—*Hydrocyanic or Prussic Acid* is much used for the fumigation of passenger steamers in port; for while poisonous to practically all forms of animal life, including vermin, it does not attack paint work. It is invisible and though it has a distinctive odour, the nose rapidly becomes deadened to the smell, so that persons may easily walk into stronger concentrations of the gas, being deceived by his nose into the idea that he is walking out of it. When the ship is opened up after fumigation particular care must be taken that fatal concentrations of the gas do not remain in pockets. Canaries are much more sensitive to HCN than men, and may be used to detect the gas.

Aniline, Nitrobenzene and other bodies which contain NH_2 , NO , and NO_2 groups, are met with in the dye industry and in the manufacture of explosives; their action is to appropriate the haemoglobin of the blood, turning it temporarily into methaemoglobin. (See ANOXÆMIA.) The following table gives an idea of their toxicity.

	Parts per million of air		
	Nitrobenzene	Aniline	Toluidine
Slight symptoms after several hours exposure.	0.2-0.4	7.0-26.0	6-23
Maximum amount that can be inhaled for 1 hour without serious disturbance	1.0	105-170	92-140

Sulphides of Arsenic, Phosphorus and Hydrogen.—*Arsenic* sometimes contaminates the air in the vicinity of storage batteries, for the charging of which impure sulphuric acid is being used. Thus in submarines whole crews may be affected. The poison is a cumulative one; small quantities inhaled accumulate in the body until a toxic concentration is reached. *Phosphine* is evolved when water acts on calcium phosphide and is used as an illuminating gas, in buoys, etc. *Hydrogen sulphide* may contaminate the air in chemical works, but is more frequently the cause of accident in sewers, where sewer gas may accumulate in pockets. Toxicity:

	Parts per million parts of air		
	Arsine	Phosphine	Hydrogen sulphide
Maximum amount which can be inhaled for one hour	50	100-200	200-300
Rapidly fatal	250	2,000	1,000-3,000

Dichloroethylsulphide—the so-called "mustard gas" or "Yperite"—was by far the most devastating gas used in the World War. It owed its potency largely to the fact that it was extremely indigestible, contaminating the ground and giving off small quantities of vapour which, if breathed for long periods of time, produced an inflammation of the respiratory passages which was either itself fatal or was liable to doom the lung to subsequent infection by bacteria. This gas also caused intense inflammation of the eyes and blistering of the skin.

Toxic Smokes such as dichlorarsine and dicyanarsine which when inhaled caused intense irritation of the nose and throat, leading to uncontrollable fits of sneezing and coughing, were also used as shell fillings in the World War.

Respirators.—Both in war and in industry the entry of poisonous gases into the respiratory system is prevented by the use of respirators. These are of two general types:

1. *The oxygen breathing set* consists of an air-tight mask (a) connected to a cylinder supplying oxygen; and (b) containing a cartridge of soda-lime or some other absorbent of carbon dioxide. The whole apparatus is self-contained, so that the subject has not and need not have access to the outer air. This form of ap-

paratus is particularly useful in atmospheres containing carbon monoxide, e.g., the air in mine galleries after an explosion, and is indispensable to rescue parties.

RESPIRATORY SYSTEM, ANATOMY OF. The respiratory tract consists of the nasal cavities, pharynx, larynx, trachea, bronchi and lungs. For the first two parts see OLFACTORY SYSTEM and PHARYNX.

Larynx.—The larynx is the upper part of the air tube specially modified for the production of notes of varying pitch, though it is not responsible for the whole of the voice. Its framework is made up of cartilages which are moved on one another by muscles, and it is lined internally by mucous membrane. The larynx is situated in the front of the neck and corresponds to the fourth, fifth and sixth cervical vertebrae. For its superficial anatomy see ANATOMY: Superficial and Artistic.

The *thyroid cartilage* is the largest in the larynx and consists of two plates or *alae* joined in the mid-ventral line. At the upper part of their junction is the *thyroid notch* and just below that is a forward projection, the *pomum Adams* ("Adam's apple"), best marked in adult males. From the upper part of the posterior border of each *ala* the *superior cornu* rises up to be joined to the tip of the great cornu of the hyoid bone by the *lateral thyro-hyoid ligament*, while from the lower part of the same border the *inferior cornu* passes down to be fastened to the cricoid cartilage by the *crico-thyroid capsule*. From the upper border of each *ala* the *thyro-hyoid membrane* runs up to the hyoid bone, while near the back of the outer surface of each the *oblique line of the thyroid cartilage* runs downward and forward.

The *cricoid cartilage* (see figs. 1 and 2) is something like a signet ring with the seal behind; its lower border, however, is horizontal. To the mid-ventral part of its upper border is attached the mesial part of the *crico-thyroid membrane*, which attaches it to the lower border of the thyroid cartilage; the lateral parts of this membrane pass up internally to the thyroid cartilage and their upper free edges form the true *vocal cords*. On the summit of the signet part of the cricoid are placed the two *arytenoid cartilages* (see fig. 2), each of which forms a pyramid with its apex upward. The base articulates with the cricoid by a concave facet, surrounded by the *crico-arytenoid capsule*, and the two arytenoids can glide toward or away from one another, while each can rotate

FIG. 1.—PROFILE VIEW OF CARTILAGES AND LIGAMENTS OF LARYNX

The *epiglottis* (see fig. 3) forms a lid to the larynx in swallowing; only the box moves up to the lid instead of the lid moving down to the box. It is leaf-shaped, the stalk being attached to the junction of the thyroid cartilages inside the larynx, while the anterior surface of the leaf is closely attached to the root of the

FIG. 2.—CARTILAGES AND LIGAMENTS OF LARYNX SEEN FROM BEHIND

tongue and body of the hyoid bone. The posterior or laryngeal surface is pitted for glands. All the cartilages of the larynx are of the hyaline variety except the epiglottis, the cornicula laryngis and the cuneiform cartilages, which are yellow elastic. The result is that all except these three tend to ossify as middle age is approached.

The *muscles of the larynx* are: (1) the *crico-thyroids*, attached to the lower border of the thyroid and the anterior part of the

cricoid, by pulling up which they make the upper part of the signet, with the arytenoids attached to it, move back and so tighten the vocal cords. (2) The *thyro-arytenoids* (see fig. 4), which run back from the junction of the thyroid alae to the front of the arytenoids and side of the epiglottis; they pull the arytenoids toward the thyroid and so relax the cords. (3) The single

FIG. 3.—MEDIAL SECTION THROUGH LARYNX TO SHOW OUTER WALL OF RIGHT HALF

arytenoideus muscle, which runs from the back of one arytenoid to the other and approximates these cartilages. (4) The *lateral crico-arytenoids* (see fig. 4) which draw the muscular processes of the arytenoids forward toward the ring of the cricoid and, by so doing, twist the vocal processes, with the cords attached, inward toward one another; and (5) the *posterior crico-arytenoids* (see fig. 4) which run from the back of the signet part of the cricoid to the back of the muscular processes of the arytenoid and, by pulling these backward, twist the vocal processes outward and so separate the vocal cords. All these muscles are supplied by the recurrent laryngeal nerve, except the crico-thyroid which is innervated by the external branch of the superior laryngeal (see NERVE: *Cranial*).

The *mucous membrane of the larynx* is continuous with that of the pharynx at the *aryteno-epiglottidean folds* which run from the sides of the epiglottis to the top of the arytenoid cartilages (see fig. 3). To the outer side of each fold is the *sinus pyriformis* (see PHARYNX). From the middle of the junction of the alae of the thyroid cartilage to the vocal processes of the arytenoids the mucous membrane is reflected over, and closely bound to, the true vocal cords which contain elastic tissue and, as has been mentioned, are the upper free edges of the lateral parts of the crico-thyroid membrane. The chink between the two true vocal cords is the *glottis* or *rima glottidis*. Just above the true vocal cords is the opening into a recess on each side which runs upward and backward and is known as the *laryngeal sacculus*; its opening is the *laryngeal sinus*. The upper lip of this slit-like opening is

called the *false vocal cord*.

The mucous membrane is closely bound down to the epiglottis and to the true vocal cords, elsewhere there is plenty of sub-mucous tissue. In the upper part of the front and sides of the larynx and over the true vocal cords the mucous membrane is lined by squamous epithelium, but elsewhere the epithelium is columnar and ciliated: it is supplied by the superior laryngeal

FIG. 4.—DISSECTION OF THE MUSCLES IN LATERAL WALL OF LARYNX SHOWN WITH THE RIGHT ALA OF THE THYROID CARTILAGE REMOVED

branch of the vagus nerve and above the glottis is peculiarly sensitive.

Trachea.—The *Trachea* or windpipe (see fig. 5) is the tube which carries the air between the larynx and the bronchi; it is from four to four and a half inches long and lies partly in the neck and partly in the thorax. It begins where the larynx ends at the lower border of the sixth cervical, and divides into its two bronchi opposite the fifth thoracic vertebra. The tube is kept always open by rings of cartilage, which, however, are wanting behind, and, as it passes down, it comes to lie farther and farther from the ventral surface of the body, following the concavity of the thoracic region of the spinal column. In the whole of its downward course it has the oesophagus close behind it, while in front are the isthmus of the thyroid, the left innominate vein, the innominate artery and the arch of the aorta. On each side of it and touching it is the vagus nerve.

The cervical part of the tube is not much more than an inch in length, but it can be lengthened by throwing back the head. This is the region in which tracheotomy is performed, and it should be remembered that in children, and sometimes in adults, the great left innominate vein lies above the level of the top of the sternum.

The trachea is made up of an external fibro-elastic membrane in which the cartilaginous rings lie, while behind, where these rings are wanting, is a layer of unstriped muscle which, when it contracts, draws the hind ends of the rings together and so diminishes the calibre of the tube. Inside these is plentiful sub-mucous tissue containing mucous glands and quantities of lymphoid tissue, while the whole is lined internally by columnar ciliated epithelium.

Bronchi.—The *Bronchi* (see fig. 5) are the two tubes into which the trachea divides, but the branches, which these tubes give off later, are also called bronchi. Put shortly, they are two long tapering tubes which run from the bifurcation of the trachea to the lower and back part of each lung, and give off a series of large ventral and small dorsal branches. The upper part of each

of these long tubes or *stem bronchi* is outside the lung and in the middle mediastinum of the thorax, the lower part embedded in the substance of the lung. The structure of the bronchi is practically identical with that of the trachea. (See G. S. Huntington's "Eparterial Bronchial System of the Mammalia," *Am. Journ. Med. Sci.* [Phila. 1898]. See also Quain's *Anatomy*, London, last edition.)

Lungs.—The *Lungs* are two pyramidal, spongy, very vascular organs in which the blood is oxygenated. They are pink normally, but, often in city dwellers are slate-coloured from local deposition of soot particles. Each lies in its own side of the thorax and is surrounded by its own pleural cavity (see COELOM AND SEROUS MEMBRANES), and has an *apex* which projects into the side of the root of the neck, a *base* which is hollowed for the convexity of the diaphragm, an outer surface which is convex and lies against the ribs, an inner surface concave for the heart, peri-

FIG. 5.—TRACHEA AND BRONCHI, INDICATING THE THYROID BODY BY A DOTTED LINE

cardium and great vessels, a sharp anterior border which overlaps the pericardium and a broad, rounded posterior border which lies at the side of the spinal column. Each lung is nearly divided into two by a *primary fissure* which runs obliquely downward and forward, while the right lung has a *secondary fissure* which runs horizontally forward from near the middle of the primary fissure. The left lung has therefore an *upper* and *lower* or *basal lobe*, while the right has *upper*, *middle* and *lower lobes*. On the inner surface of each lung is the *root* or *hilum* at which alone its vessels, nerves and ducts (bronchi) can enter and leave it.

The structures contained in the root of each lung are the branches and tributaries of (1) the *pulmonary artery*, (2) the *pulmonary veins*, (3) the *bronchi*, (4) the *bronchial arteries* which supply the substance of the lung, (5) the *bronchial veins*, (6) the *bronchial lymphatic vessels and glands*, (7) the *pulmonary plexuses of nerves*. Of these the first three are the largest and, in dividing the root from in front, the veins are first cut, then the arteries and last the bronchi. As the bronchi become smaller and smaller by repeated division, the cartilage completely surrounds them and tends to form irregular plates instead of rings—they are therefore cylindrical, but when the terminal branches (*lobular bronchi*) are reached, the cartilage disappears and hemispherical bulgings called *alveoli* occur (fig. 6 A). At the very end of each lobular bronchus is an irregular chamber, the *atrium* (fig. 6 B), and from this a number of thin-walled sacs, about 1 mm. in diameter, open out. These are called the *infundibula* (fig. 6 C), and their walls are pouched by hemispherical air-cells or alveoli like those in the lobular bronchi. Each lobular bronchus with its atrium and infundibula forms a *lobule* of the lung, and these lobules are separated by connective tissue, and their outlines are evident on the surface of the lung.

FIG. 6—DIAGRAM OF TWO LOBULES OF THE LUNG

The muscular tissue, which in the larger tubes was confined to the dorsal part, forms a complete layer in the smaller; but when the lobular bronchi are reached, it stops and the mucous membrane is surrounded by the elastic layer. In the lobular bronchi, too, the lining epithelium gradually changes from the ciliated to the stratified or pavement variety, and this is the only kind found in the infundibula and alveoli. Surrounding each alveolus is a plexus of capillary vessels so rich that the spaces between the capillaries are no wider than the capillaries themselves, and it is here that the exchange of gases takes place between the air and the blood.

The muscular tissue, which in the larger tubes was confined to the dorsal part, forms a complete layer in the smaller; but when the lobular bronchi are reached, it stops and the mucous membrane is surrounded by the elastic layer. In the lobular bronchi, too, the lining epithelium gradually changes from the ciliated to the stratified or pavement variety, and this is the only kind found in the infundibula and alveoli. Surrounding each alveolus is a plexus of capillary vessels so rich that the spaces between the capillaries are no wider than the capillaries themselves, and it is here that the exchange of gases takes place between the air and the blood.

Embryology.—The respiratory system is developed from the ventral surface of the foregut as a long gutter-like pouch which reaches from just behind the rudiment of the tongue to the stomach. Limiting the anterior or cephalic end of this is a Ω -shaped elevation in the ventral wall of the pharynx which separates the ventral ends of the third and fourth visceral bars and is known as the *furcula*; it is from this that the epiglottis, aryteno-epiglottidean folds and arytenoid cartilages are developed. Later on the respiratory tube is separated from the digestive by two ridges, one on each side, which, uniting, form a transverse partition. In the region of the furcula, however, the partition stops and here the two tubes communicate. The caudal end of the respiratory tube buds out into the two primary bronchi, and the right one of these, later on, bears three buds, while the left has only two; these are the secondary bronchi, which keep on dividing into two, one branch keeping the line of the parent stem to form the stem bronchus, while the other goes off at an angle. By the repeated divisions of these tubes the complex "bronchial tree" is formed and from the terminal shoots the infundibula bud out. The alveoli only develop in the last three months of foetal life. The thyroid cartilage is probably formed from the fourth and fifth bronchial bars, while the cricoid seems to be the enlarged first ring of the trachea. Before birth the lungs are solid and much less vascular than after breathing is established. (For further details see Quain's *Anatomy*, vol. I, Lond. 1908.)

Comparative Anatomy.—In the lower vertebrates respiration is brought about by the blood vessels surrounding the gill clefts (see PHARYNX). In the higher fishes (Ganooids and Teleosts), the "swim bladder" appears as a diverticulum from the dorsal wall of the alimentary canal, and its duct sometimes remains open and at others becomes a solid cord. In the former case it is probable that the blood is to some extent oxygenated in the

vascular wall of this bladder. In the Dipnoi (mud-fish) the opening of the swim bladder shifts to the ventral side of the pharynx and the bladder walls become sacculated and very vascular, so that, when the rivers are dried up, the fish can breathe altogether by means of it. In the S. American and African species of mud-fish the bladder or lung, as it may now be called, is divided by a longitudinal septum in its posterior (caudal) part into right and left halves. In this sub-class of Dipnoi, therefore, a general agreement is seen with the embryology or ontogeny of Man's lungs. In the Amphibia the two lungs are quite separate though they are mere sacculated bags without bronchi. A trachea, however, appears in some species (e.g., *Siren*) and a definite larynx with arytenoid cartilages, vocal cords and complicated muscles is established in the Anura (frogs and toads). In most of the Reptilia the bag-like lungs are elaborated into spongy organs with arborizing bronchi in their interior. From the crocodiles upward a main or stem bronchus passes to the caudal end of the lung, and from this the branches or lateral bronchi come off. The larynx shows little advance on that of the Anura.

The respiratory organs of birds are highly specialized. The larynx is rudimentary, and sound is produced by the *syrix*, a secondary larynx at the bifurcation of the trachea, this may be tracheal, bronchial or, most often, tracheo-bronchial. The lungs are small and closely connected with the ribs, while from them numerous large air sacs extend among the viscera, muscles and into many of the bones, which, by being filled with hot air, help to maintain the high temperature and lessen the specific gravity of the body. This pneumaticity of the bones is to a certain extent reproduced by the air sinuses of the skull in crocodiles and mammals. Still, the amount of air in the bones does not necessarily correspond with the power of flight, for the Ratitae (ostriches and emus) have very pneumatic bones, while in the sea-gulls they are hardly pneumatic at all.

In mammals the thyroid cartilage becomes an important element in the larynx, and in the Echinida the upper and lower parts of it, derived respectively from the fourth and fifth bronchial bars, are separate (R. H. Burne, *Journ. Anat. and Phys.* xxxviii. p. xxvii.). The whole larynx is much nearer the head than in Man, and in young animals the epiglottis projects up behind the soft palate. This prevents the milk trickling into the larynx during suckling, and is especially well seen in the Marsupials and Cetacea, though evidences of it are present in the human embryo. In the lower mammals an inter-arytenoid cartilage is very frequent (see J. Symington, "The Marsupial Larynx," *J. Anat. and Phys.* xxxiii. 31, also "The Monotreme Larynx," *ib.* xxiv. 90).

The lungs show much variation in their lobulation; among the porcupines forty lobes have been counted in the right lung, while in other mammals no lobulation at all could be made out. The *azygos lobe* of the right lung is a fairly constant structure and is situated between the post-caval vein and the oesophagus. It is supplied by the terminal branch of the right stem bronchus and, although it is usually absent in Man, the bronchus which should have supplied it is always to be found. (F. G. F.)

RESPIRATORY SYSTEM, DISEASES OF. In almost all the diseases of the respiratory system, five symptoms are present either singly or in groups—cough, expectoration, pulmonary hæmorrhage, pain in the chest and shortness of breath. Prompt cognizance of these symptoms aids early diagnosis and proper treatment.

Dry cough lasting more than a month may portend tuberculosis or cancer of the lung. Cough with wheeze occurs in asthma, closure of the air passage by tumour, foreign body, ulceration and bronchitis. Hollow or brassy cough indicates pressure upon the larynx by tumour, aneurysm or disease of the vocal cords. Ear wax, a long uvula and tonsillitis cause cough, especially in children. Expectoration of rust-coloured sputum usually means pneumococcal pneumonia. In Friedländer's pneumonia, the sputum is extraordinarily sticky. In abscess and bronchiectasis it is fetid, and in congestion frothy and blood-tinged.

Hæmorrhage from the lung occurs most frequently in bronchiectasis, pulmonary tuberculosis, cancer of the lung, abscess, heart disease, fungous and parasitic diseases, pneumonias (par-

ticularly Friedländer's bacillus pneumonia), diseases of the blood, formation of clots in the blood vessels of the lungs, scurvy and blast injuries to the lungs.

Pain in the chest signifies irritation of the parietal pleura and is common in infectious diseases, particularly tuberculosis and pneumonia. The pain is sharp and stabbing in nature, aggravated by breathing, and usually is localized in the side or the front part of the chest. Pleurisy is often followed by the formation of fluid in the pleural space. If the fluid is blood-tinged, it suggests strongly cancer of the lung. In cancer the pain may be deep-seated and difficult to localize. When the pleura covering the diaphragm is irritated, the pain may be felt on the shoulder, side of the neck or in the abdomen simulating appendicitis. Thoracic pain may be brought about by diseases of the heart, aorta and gall bladder, injury to the ribs, intercostal neuralgia and shingles.

Shortness of breath indicates an inadequate supply of oxygen to the body. It may be mild and apparent only on exertion as in early emphysema, or severe and constant as in congestion of the lungs in heart failure. Obstruction in the larynx and trachea by a foreign body, tumour, swelling, infections (especially diphtheria), tuberculosis and syphilis cause varying degrees of shortness of breath. Enlarged thyroid, thymus and lymph glands, aortic aneurysm and tumours of the oesophagus and mediastinum cause shortness of breath by pressure upon the air passage. Tracheobronchitis, pneumonia, asthma, pulmonary fibrosis, tuberculosis, fungous infections, congestion of the lungs, inhalation of noxious fumes and dusts and the collection of air, blood, pus and other fluids between the lungs and the chest wall also induce breathlessness. When it is pronounced there is associated bluish discoloration of the lips and the nail beds. This is seen in congestion, fibrosis, tuberculosis, emphysema, injuries to the chest and collection of fluid or air or both in the pleural space.

A careful evaluation of the symptoms, physical and roentgenologic findings, direct visualization of the larynx, trachea and bronchi by means of a bronchoscope, microscopic studies of the sputum and other laboratory procedures aid in establishing a correct diagnosis.

Diseases Caused by Infections.—Influenza, common colds and pneumonias are discussed elsewhere (see COLD; INFLUENZA; PNEUMONIA).

Bacterial infections of the accessory nasal sinuses may follow common colds, swimming and diving and dental abscesses. Bed rest, nasal shrinkage, application of heat, analgesics and sedatives are indicated. In suppurative sinusitis surgical drainage and antibiotics are sometimes necessary (see also SINUS).

Inflammation of the larynx with hoarseness of the voice may follow infections of the upper respiratory tract, injudicious use of the voice, alcohol and tobacco and inhalation of chemical fumes. In children it causes nocturnal episodes of harsh cough, respiratory difficulty and exhaustion. Abstinence from speaking and inhalation of steam are helpful. The laryngitis (*q.v.*) in tuberculosis and syphilis improves only when the latter diseases respond to treatment.

Tracheitis is an inflammation of the trachea. It is usually a complication of influenza, pneumonia, or other respiratory infections. The symptoms are a persistent, dry, irritating cough, which may be accompanied by a low-grade fever and malaise. The sputum is usually scanty and mucous. The condition is usually self-limiting and resolves within a few days. Treatment is symptomatic, consisting of rest, fluids, and cough suppressants. In severe cases, antibiotics may be indicated.

Bronchiectasis (*q.v.*) is a disease characterized by dilatation and infection of the bronchi. This disease may be congenital or acquired. Bronchial obstruction by a foreign body, neoplasm, tuberculosis, chronic sinusitis and other infections are important causes. Unpleasant breath, chronic cough, profuse expectoration of foul sputum, bouts of pulmonary haemorrhage, and enlarge-

ment of the tips of the fingers and toes are the features. In some the disorder remains symptomless only to be discovered unintentionally. Cough sedatives and antibiotics are of no permanent value. Postural and bronchoscopic drainages afford temporary relief. Early diagnosis with surgical removal of the diseased portion of the lung is recommended.

Abscess of the lung may follow aspiration of food particles, liquids and other foreign bodies, infected tissues and other matters during an operation in the mouth and throat under general anaesthesia, implantation of septic emboli after abdominal and pelvic operations, new growths of the lungs and oesophagus, pulmonary inflammation, injuries to the chest with penetration of the lungs and certain forms of pneumonia. Cough, fetid sputum, blood-spitting, pain in the chest, irregular fever and enlargement of the fingertips are the common features. Roentgenologic and bronchoscopic examinations, and laboratory study of the sputum and blood help in determining the cause. Some lung abscesses heal spontaneously. The younger the patient, the better is the outlook. Bed rest in fresh air with a nutritious diet is essential. Penicillin and other antibiotics are of great value. Operation is indicated when the abscess does not respond promptly to medical treatment.

Fungous infections of the lungs are caused by three main varieties of simple filamentous plants: a mouldlike form causing aspergillosis, a yeastlike form causing moniliasis, histoplasmosis, coccidioidomycosis, sporotrichosis and blastomycosis, and a higher variety producing actinomycosis.

Pulmonary mycoses have in common fever, chronic cough, expectoration of purulent sputum, haemorrhage, pain in the chest and loss of weight and strength. An acute infection resembles pneumonia and a chronic form of pulmonary tuberculosis.

Histoplasmosis has been seen in Central America, the south Pacific islands and the United States, particularly along the Mississippi river. The diagnosis is made by roentgenologic examination of the chest, skin test and by finding the fungus in the blood, lymph nodes and other tissues. Spontaneous healing and calcification of the foci occur in mild infections. When the infection is severe, the outlook is poor. There is no satisfactory treatment.

Coccidioidomycosis is endemic in the San Joaquin valley of California and in other southwestern regions of the United States. It probably occurs in other parts of the world. The infection occurs frequently during the dry season and in dusty conditions; the disease follows the inhalation of spore-laden dusts. It is not transmissible from person to person. The inhabitants of the endemic region receive the infection during the first year of residence and develop some degree of immunity. The primary infection has a high morbidity but a low mortality rate. In the acute stage the disease resembles viral pneumonia, and in the chronic stage it simulates tuberculosis. A positive diagnosis is made by finding the fungi in the sputum, lymph glands and other infected tissues. In mild cases, bed rest, a bland diet, proper elimination and measures to control the cough are all that is required. In severe cases, surgery may be indicated.

The incidence of coccidioidomycosis has been increasing steadily since 1925. In 1950, there were 1,000 cases reported in the United States, Canada, England and Wales. To a certain extent, this paradox could have been due to the increased interest in roentgenologic surveys for tuberculosis. There was no doubt as to the increased frequency with which tuberculosis was found among the aged at mid-century. In many of these the disease appears as acute tuberculous pneumonia. The

incidence of the disease has been increasing steadily since 1925. In 1950, there were 1,000 cases reported in the United States, Canada, England and Wales. To a certain extent, this paradox could have been due to the increased interest in roentgenologic surveys for tuberculosis. There was no doubt as to the increased frequency with which tuberculosis was found among the aged at mid-century. In many of these the disease appears as acute tuberculous pneumonia. The

roentgenologic surveys during World War II of the military personnel, college students and large industrial groups revealed that slightly less than 1% examined showed significant pulmonary tuberculosis. In the United States it was estimated that 70,000-80,000 people were infected with tuberculosis at mid-century and of these, 600,000 were actually ill. About 60,000 were dying annually from the disease.

Early diagnosis and proper treatment consisting of bed rest, nutritious diet, collapse therapy, lobectomy, pneumonectomy streptomycin and para-aminosalicylic acid prolong lives. Nicotinic acid hydrazide was introduced experimentally in the 1950s. As long as the patient has active disease with tubercle bacilli in the sputum, it would be wise for him to be in an institution. Treatments can be carried out most effectively if the patient is in a hospital. Dry climate and high altitude are not prerequisites for cure.

Those who have been exposed to tuberculosis should have semi-annual examinations for any evidence of disease. Immunization against tuberculosis by the general use of BCG vaccine for all infants, children and tuberculin-negative persons in the United States is not recommended. Doctors, medical students and nurses who are exposed to the infection, all hospital, sanatorium and laboratory personnel who come in close contact with tuberculous patients, individuals who are exposed to tuberculosis in their homes, patients and employees in mental institutions, prisons and other custodial institutions, and children and adults considered to have inferior resistance to tuberculosis are advised to be vaccinated.

Diseases Caused by New Growths.—Cancer of the lung originates usually in the bronchus. It appeared to be increasing in incidence at mid-20th century. In the United States there were about 500,000 people under care for cancer at that time, and of these approximately 23,000 had cancer of the lung. Eight thousand or more new patients with this disease were seen each year. The greatest incidence was occurring in the fifth, sixth and seventh decades of life, predominantly in males.

The cause remained unknown, but its greater prevalence among residents of urban areas suggested bronchial irritation as a cause. Smoking as a factor had been emphasized. Radioactive particles when inhaled may produce new growths. The incidence of bronchogenic carcinoma is greater among uranium miners and chromate workers than in the general population.

Cough is the most common symptom. At the onset the cough is dry, but later it becomes productive of mucopurulent sputum frequently streaked with blood. Pulmonary haemorrhage, wheezing respiration, chest pain, fever, loss of weight and strength, hoarseness and breathlessness are other accompanying symptoms.

Röntgenologic examination of the chest, a careful consideration of the symptoms and signs, direct visualization of the bronchial tract by means of a bronchoscope and microscopic examination of the bronchial secretion for cancer cells are necessary for a correct diagnosis.

Early diagnosis and removal of the entire involved lung offer the only hope. Even after complete removal of the lung, only 20% live as long as five years. Frequently by the time the patient seeks medical advice, the disease has already progressed too far for successful surgery.

New growths may originate in the mucous membrane of the nasopharynx and in the pleura. Surgical removal with radium therapy is recommended. Cancer of the larynx developing in the vocal cords has a fair outlook, whereas that originating in the mucous membrane covering the cartilages or the wall of the larynx is poor.

Persistent hoarseness in an individual apparently in good health should arouse suspicion. Early removal of the growth and irradiation offer much hope. (See also CANCER.)

Diseases Caused by Inhalation of Dusts and Fumes.—Prolonged inhalation of silica created in such industries as mining, drilling, sand-blasting, stone-cutting, rock-crushing, the manufacture of scouring powders and other operations in which quartz, sand, granite, sandstone and marble are processed, results in silicosis (q.v.), causing damage to the lungs by fibrosis.

Shortness of breath, particularly on exertion, cough, expectoration, haemoptysis, chest pain, loss of weight and strength are the symptoms. In far-advanced silicosis, emphysema, pleural thickening, heart failure and pulmonary tuberculosis develop frequently. The usual treatment for pulmonary tuberculosis is ineffective in the presence of advanced silicosis.

Proper ventilation and the use of a mask do much in the prevention of silicosis. The efficacy of inhaled aluminum hydroxide as a preventative is not generally accepted. Once silicosis is well-established, no treatment has any value and life expectancy is considerably shortened.

Asbestos is hydrated silicate of magnesium and is used in the manufacture of insulating materials. Asbestos fibres, upon inhalation, tend to obstruct the terminal portions of the air passages and set up areas of fibrosis. Long continued exposure to the dusts causes widespread fibrosis of the lungs. The onset of the disease is gradual with the appearance of cough, expectoration, breathlessness, loss of weight and strength. Two frequent complications are pulmonary tuberculosis and heart failure. There is no effective treatment for asbestosis and its sequelae. In the manufacture of fluorescent lights the workers may be exposed to beryllium. This compound, upon inhalation, produces acute tracheobronchitis, pneumonia, pulmonary oedema or fibrosis.

Inhalation of bagasse (the residue of sugar cane after extraction, extensively used in the manufacture of building materials) causes bronchitis and occasionally pneumonia, and the condition is termed bagassosis.

Inhalation of cotton fibres may produce pulmonary changes termed byssinosis. Dyes, synthetic rubber, furs, hairs and the dusts in threshing grain are also injurious. Fumes of ammonia, formaldehyde, sulphur dioxide, chlorine, oxides of nitrogen and cadmium when inhaled in sufficient concentration cause chemical pneumonia. Mustard gas, lewisite, chloropicrin, acetates in strong concentration may bring about sudden death from pulmonary inflammation, oedema and asphyxia. Prevention of the hazards is possible in large measure by proper ventilation and the use of masks. In cases of acute inflammation, the patient must be treated by emergency measures.

In patients with pneumonia or lung abscess, the management is the same as for these conditions.

Diseases Caused by Disturbed Circulation.—Infections of the lungs, inhalation of chemical irritants, alcoholic, barbiturate and other intoxications, diseases of the heart and injuries to the chest, head and spine cause pulmonary congestion producing breathlessness, cough and frothy and blood-tinged sputum. Bed rest, application of moderate heat to the body, morphine and oxygen inhalation are indicated. A correction of the underlying cause is essential for effective treatment. The blood vessels within the lung may be occluded by clots giving rise to infarction. Cough, expectoration, chest pain and blood-spitting are the symptoms. When a main pulmonary artery is blocked by a large clot, sudden death usually ensues. Such a complication may occur after injuries to the limbs and after abdominal and pelvic operations. When the pulmonary vessels become thickened, giving rise to pulmonary hypertension, the patient has constant shortness of breath with bluish discoloration of the lips and fingertips. The outlook is poor.

Diseases Caused by Allergy.—Allergic rhinitis and sinusitis are characterized by perennial colds, difficulty in breathing, paroxysmal attacks of sneezing and nasal discharge. Allergic factors are animal epidermal substances, pollens, moulds, house dusts, foods and occupational dusts. Whenever possible, the specific excitants should be identified by means of sensitivity tests. Avoidance of known allergic agents, desensitization and antiasthmatic drugs are helpful.

Hay fever (q.v.) is caused by sensitiveness to air-borne pollens. Pollens of the oak, elm, hickory, poplar, ash and birch are responsible in the spring, beginning in March and ending in May. The pollens of grasses, plantain and sorrel are the causes in May, June and July. In August and September ragweed, mountain cedar, amaranths and artemisia are the factors. Those suffering in the autumn may find relief in Europe, California, the White

mountains and the coast of Maine. No locality affords complete relief in the spring and summer except upon the ocean. Antihistaminic drugs control the symptoms to a certain extent. Specific treatment with pollen extracts is helpful.

Transitory pulmonary infiltration known as allergic pneumonia may occur in those suffering from asthma, hay fever and allergic rhinitis. This is not a serious condition, but may be mistaken for tuberculosis and other serious diseases (see also ALLERGY; ANAPHYLAXIS; ASTHMA).

Emergencies.—Coins, pins, nails, screws, buttons, dentures, nuts and other objects may lodge in the air passages, producing atelectasis. These accidents cause gagging, choking and coughing with bluish discoloration of the face. Small metallic objects may remain within the bronchus for some time without producing symptoms, whereas vegetable matter such as a peanut, because of rapid swelling, brings about early symptoms such as wheezing, cough, pain in the chest, blood-spitting and fever. Treatment is removal of the object by means of a bronchoscope.

Close proximity to explosion causes diffuse haemorrhages in the lungs, particularly in persons in closed spaces. Prostration, cough, expectoration of blood-tinged sputum, shortness of breath, pain in the chest and rapid heart action are the usual symptoms. Bed rest, external heat, oxygen, transfusions and morphine are beneficial. Crushing injuries and penetrating wounds of the chest produce symptoms like those seen in lung blast and the treatment is the same. When large amounts of blood, with or without air, accumulate in the pleural space, it may be necessary to withdraw it lest serious interference with circulation and respiration occur. Fracture of the rib is best treated by rest in bed and drugs to relieve pain. Splinting the chest may aggravate the discomfort. In atomic bombing, if vomiting, diarrhoea, fever and prostration occur on the day of injury, the outlook is hopeless. If vomiting occurs on the day of the bombing followed by a period of asymptomatic interval, survival is possible. If there is no vomiting on the day of bombing, the victim will most likely recover. (See also EAR, NOSE AND THROAT, DISEASES OF THE.)

RESTAURANT. This term was first used for an establishment where refreshments and meals were provided by one Boulanger, or Champ d'Oiseau, who opened the first establishment of the kind in the rue des Poullies, Paris, about 1765. The success of the house was almost instantaneous, and brought imitators, other restaurants being opened by chefs and stewards who left their employers. A notable advance followed the Revolution, when ruined aristocracy could no longer afford large retinues. Amongst the early restaurants was one managed by Antoine Beauvilliers.

The "Ordinary."—The earliest predecessors in England of the modern restaurant were the old coffeehouses and taverns which had a daily "ordinary"—a mid-day dinner or supper, generally noted for a particular dish, and served at a common table at a fixed price and time. Some of the more ancient of these arose in the middle of the 17th century. The first coffeehouse was opened in St. Michael's alley, Cornhill, by Pasqua Rosee, a Greek. This youth was the first to teach the method of roasting coffee and to introduce the drink into England.

Nearly 100 years before it was burnt down in the Great Fire of 1666, the Castle ordinary, off Paternoster Row, was a great place for booksellers and literary men. It was rebuilt after the Great Fire, and attained its greatest fame as Dolly's Chop House, in Queen's Head Passage, Paternoster Row, when "Dolly," a proprietress, introduced pretty serving maids in place of men. For 150 years it was famous for its beef steaks and gill ales, and among its customers were Fielding, Defoe, Smollett, Richardson, Swift, Dryden, Pope, Gainsborough and Handel. It was demolished in 1885. Jonathan's Coffee House in Change alley, opened at the time of the South Sea Bubble speculation, was a luncheon rendezvous for stock jobbers long prior to the establishment of the

Stock Exchange, and similarly Lloyds' Coffee House in Lombard street and Abchurch lane was the underwriters' headquarters and the cradle of Lloyds of to-day.

Other famous ordinaries were the Rainbow, in Fleet street, frequented by Dr. Johnson, Boswell and other notables, the Old Cock, Nando's, the Goose and Gridiron, also near St. Paul's, which, as the Mitre, was the first "musick house," and Simpson's Fish Dinner House, Bird-in-Hand court, Chapside. The last-named was founded in 1723. It served a 2/- "fish ordinary" of soup, three fish courses, haunch of mutton and cheese 200 years ago, and was doing the same in 1920. Though no ordinary is served there, the Cheshire Cheese in Fleet street retains the atmosphere, and the steak, kidney, lark and oyster pudding of the days of Dr. Johnson.

Reference to the "ordinaries" may be found as long ago as 1577 (Hollinshead). In the 17th century the more expensive ordinaries were frequented by men of fashion, and gambling usually followed, so that the term "ordinary," by which was understood either the establishment or the meal was then more synonymous with the gambling house than the tavern. In the early part of the 18th century, however, the character changed again, and the choice of such establishments was great in number and varied in quality. Steele in the *Tatler* (1703) refers to a board being hung out of a window announcing "an excellent ordinary on Saturdays and Sundays." In the *Journey through England* (1714) it is remarked, "At two we generally go to dinner. Ordinaries are not so common here as abroad yet the French have set up two or three good ones in Suffolk street, where one is tolerably well served."

Pontack's was considered one of the finest, and Defoe says that dinner there cost from 4s. to 5s. each, or anything up to a guinea. In addition a man could "dine," take his food in a mixed company of footmen and chair men for 24d., have a sausage at a "farthing fry," or go to one of the taverns where the real "ordinary," a very good dinner of several courses, was served at from 6d. to 1s. Johnson records that he used to dine regularly for 7d. The usual hours for the meal were between 1 and 4, and there were 33 taverns serving ordinaries in the area between Threadneedle and Lombard streets and Gracechurch and Bishopgate streets.

Some of these have lasted until now, but the majority have had to give way to bank and office premises. Of the old ones, Birch's, formerly in Cornhill, dates from 1700, and Stone's Chop House in Pantion street W., from 1770.

The restaurant habit as known to-day in London dates from the later decades of the 19th century when large fashionable hotels began to cater to the needs of fastidious diners on an elaborate scale. Suppers after the theatre became popular, and the establishments attached to hotels competed at widely varying prices while small restaurants sprang up in Soho, run by French and Italian proprietors, and provided good dinners tastefully served, at reasonable prices.

Modern grill rooms are an even later offshoot of the hotels and restaurants, and owe their existence largely to the travelling American who, with his own ideas of comfort, felt he did not wish to dress every night, but that otherwise he would be out of place in a fashionable restaurant. The grill room made no demand for dress, and offered an excellent dinner, long or short as required, served with rapidity in luxurious surroundings. London's first grill room was opened by Spiers and Pond in the '60s under the arch at Ludgate Hill, and the Savoy hotel was the first of the large hotels to inaugurate a similar room. One of the first restaurants in London was that opened at Whiteleys in 1873, purely for the benefit of customers, but that it was not enthusiastically received is shown in the first year's loss of £183 on £1,620 turnover. But from then on the idea grew in favour and the takings annually. Soup or fish, meat and vegetables were served for 1s. 6d.

In 1884 the first A.B.C. teasaph was opened near London Bridge Station, and was ridiculed, the coffeeshops with their high-backed benches being still popular. Ten years later J. Lyons and Co. (See LYONS, SIR JOSEPH) opened at 213 Piccadilly, their first teasaph.

All the larger restaurants have banqueting halls and other rooms where Masonic, regimental, club and other festival dinners may be

had at varying prices. Among the "classic" restaurants are the Carlton, Savoy, Berkeley, Ritz, Claridge's, Oddenino's, Romano's, and the Café Royal, and latterly the May Fair, the Dorchester, and the Grosvenor House.

UNITED STATES

The word restaurant in America was first applied to the dining rooms of the better class hotels and to a few high class à la carte restaurants. As establishments of different types came into being their character was fixed by some such expression as coffee-house, as in England. Then came cafés, lunch rooms, dairy lunch rooms, cafeterias, tea rooms, waffle houses, fountain lunches, sandwich shops and many others, all included in the general use of the word restaurant.

The early American eating places were patterned after the inns, taverns and coffee houses in England and on the Continent. In Philadelphia there was the Blue Anchor Tavern, opened as early as 1683 or 1684. Ye Coffee House was opened in 1700, the proprietor being Henry Flower, who was also the postmaster of the province. In fact, the Coffee House was in all probability used as the post office for a time. The London Coffee House, opened in 1703, and the second London Coffee House, established in 1754 by William Bradford, printer of the Pennsylvania journal, and the City Tavern (1773) were meeting places for the sea captains, merchants and others who went there to transact their business, as well as social gathering places for the leading citizens. The City Tavern, later known as the Merchants Coffee House, was long considered the largest and best coffee house in America.

Ye Crown Coffee House, in Boston, was built in 1711 on the Boston Pier, or Long Wharf, by Jonathan Belcher.

In New York the famous old Fraunces' Tavern at Broad and Pearl streets near the Battery still stands, only the ground floor being used as a restaurant. Upstairs the Sons of the Revolution protect the collection of mementoes of Washington's life and times in the room in which he said farewell to his officers. Brown's Chop House was famous for many generations not only for its chops and steaks but for its unique collection of old photographs, prints and autographs. For years it was the rendezvous of journalists, authors, actors and painters. The Old St. Denis on Broadway at 11th street in the 90's; Fleischman's Vienna Garden, opposite the St. Denis, with its continental touch; Dorlon's on 23rd St., famous for its sea food; the old Hoffman House; Café Martin and the Holland House should be at least mentioned. But supreme over all until Sherry opened was Delmonico, first built on Broad street, later moved to 26th street and finally to 44th street and Fifth avenue. Soon after Delmonico moved to 44th street, Sherry opened diagonally across the avenue and, attracting the younger generation, threatened for a time to usurp the crown so long worn by Delmonico. But the two great restaurants were both destined to go. Delmonico closed its doors, and the Sherry of to-day is not the old-time Sherry.

Bégue's, opened over 60 years ago in New Orleans for the butchers of the city, is now a fashionable rendezvous.

Don's and the El Dorado House, famous for their Spanish cooking, were the earliest eating places in San Francisco in the pioneer days. Lavish feasts and exorbitant prices were the order of the day. The most fashionable restaurant was the Iron House made of sheet iron which had been brought in a sailing vessel around the Horn. Unique among the restaurants was the Bazzaro, opened by an Italian. The first restaurant by that name was a sailing vessel which had run aground in the bay. Later this spot was filled in with land and a house built on the same site. The restaurant is still run by members of the original family.

Other eating places of special interest were the Tehama House, frequented by the army and navy officers; Marchand's, where the food was cooked in the window to entice the passerby; and the Mint, which boasted an old Southern mammy in the kitchen. Few of these famous places survived the San Francisco fire of 1906.

See also CAFETERIA.

RESTIF, NICOLAS EDMÉ (1734-1806), called **RESTIF DE LA BRETONNE**, French novelist, son of a farmer, was born at

Sacy (Yonne) on Oct. 23, 1734. He was educated by the Jansenists at Bicêtre, and on the expulsion of the Jansenists was received by one of his brothers, who was a curé. Owing to a scandal in which he was involved, he was apprenticed to a printer at Auxerre, and, having served his time, went to Paris. Here he worked as a journeyman printer, and in 1760 he married Anne or Agnes Lebègue, a relation of his former master at Auxerre. Restif produced about two hundred volumes, many of them printed with his own hand, on almost every conceivable subject. He drew on the episodes of his own life for his books, which display an extraordinary licence in choice of subject and in treatment. They provide useful documents for the history of the underworld of the period. They include: *Le Pied de Fanchette*, a novel (1769); *La Pornographe* (1769), a plan for regulating prostitution which is said to have been actually carried out by the Emperor Joseph II., while not a few detached hints have been adopted by continental nations; *Le Paysan perverti* (1775), a novel with a moral purpose, sufficiently horrible in detail; *La Vie de mon père* (1779); *Les Contemporains* (42 vols., 1780-1785), a vast collection of short stories; *Ingénus Saxanacour*, also a novel (1785); and, lastly, the extraordinary autobiography of *Monsieur Nicolas* (16 vols., 1794-1797; the last two are practically a separate and much less interesting work), in which at the age of sixty he has set down his remembrances, his notions on ethical and social points, his hatreds, and above all his numerous loves, real and fancied. The original editions of these, and indeed of all his books, have long been bibliographical curiosities owing to their rarity, the beautiful and curious illustrations which many of them contain, and the quaint typographic system in which most are composed. Just before his death (Feb. 2, 1806) Napoleon gave him a place in the ministry of police.

See J. Aschard's selection from the *Contemporains*, with excellent introductions (3 vols., 1875), and the valuable reprint of *Monsieur Nicolas* (14 vols., 1883-84); also Eugen Dührer, *Restif de la Bretonne, der Mensch, der Schriftsteller, der Reformator* (Berlin, 1906), and *Restif-Bibliothek* (Berlin, 1906).

RESTITUTION; see DIVORCE; LARCENY.

RESTRAINT, in law, a restriction or limitation. The word is used primarily in four connections:

Restraints on Alienation.—When real property is conveyed in fee simple, restricting the right of the grantee to alienate it, thereby derogating from the grant, it was considered by the common law so inimicable to the policy of permitting the ready transfer of land that such restrictions were stricken down by the courts as illegal. A general restraint upon alienation was thus void, though the courts would uphold restraint limited with reference to time or to a class of persons. See Gray, *Restraints on the Alienation of Property* (2nd ed. 1893).

Restraints on Anticipation.—A restraint on anticipation consists of an attempt by the grantor of an estate for life to prevent the grantee from anticipating the income by alienating it voluntarily or involuntarily prior to its acquisition. In England such restraints are invalid save with reference to restraints imposed upon a married woman as to her separate estate during the period of coverture. See Conveyancing Act, 1881, s. 39; Married Women's Property Act, 1883, s. 29. In the United States such restraints accompanying the creation of a spendthrift trust are valid in many States. See TRUST AND TRUSTEES.

Restraint of Marriage.—A gift or bequest to a person may have a condition attached in restraint of marriage. A condition in general restraint of marriage is void, as being contrary to public policy, although a condition in restraint of a second marriage is not void. A condition in partial restraint of marriage is valid, and may be either to restrain marriage with a particular class of persons, e.g., a papist, a domestic servant or a Scotsman, or under a certain age.

Restraint of Trade.—A contract in general restraint of trade was deemed void at common law as against public policy (*Michel v. Reynolds*, 1 P. Wms. 181 [1711]), though a contract in partial restraint of trade accompanying the sale of a business or the employment of an individual is valid (*United States v. Addyston Pipe and Steel Co.*, 85 Fed. 271 [1893]). The modern attitude, however, is that the test that should determine the validity of con-

tracts in restraint of trade should be whether they are reasonably necessary to protect the interests of the parties and not unnecessarily harmful to the general public (*Nordenfjelt v. Nordenfjelt Gins and Ammunition Co.* [1894], Appeal Cases 535). Legislation and judicial decision in recent years widely affected the doctrines of restraint of trade.

Purdy, *Corporate Concentration and Public Policy* (1942); S. A. Weigel, *The Fair Trade Acts* (1938).

RESURRECTION PLANT (*Anastatica hierochuntina*), a small herb of the family Cruciferae, called also rose of Jericho, native to Arabia, Iran and Egypt. Upon the ripening of the seeds during the dry season, the leaves fall off and the branches curve inward so that the dry plant assumes a globular form. It then rolls about in the manner of a tumbleweed (*q.v.*), until the rainy season. When wetted the branches unfold and it assumes for a time the appearance of a living plant. The name is also given to two other plants. One is the mosslike *Selaginella lepidophylla* which also dries up into a ball and expands when wetted. It is called also bird's-nest moss and is found from Texas southward to Peru. The other is the resurrection fern (*Polypodium polypodioides*), the commonest epiphytic fern in Florida.

RESZKE, JEAN DE (1850-1925), operatic singer, was born at Warsaw, Pol., on Jan. 14, 1850. His parents were Poles; his father was a state official and his mother a capable amateur singer, their house being a recognized musical centre. He studied law before adopting singing as his profession and going to Italy to study. He made his first public appearance, as a baritone, at Venice in Jan. 1874, as Alfonso in *La Favorita*, and in the following April he sang for the first time in London, appearing at Drury Lane theatre, and a little later in Paris. He was not entirely successful and retired for a further period of study, during which his voice gained remarkably in the upper register; so that when he made his first reappearance at Madrid in 1879 it was as a tenor, in the title-role of *Robert le Diable*. His great fame as a singer, especially in Wagnerian parts, dates from this time. He appeared at the Metropolitan Opera house, New York, N.Y., from 1893 to 1899. In 1904 he retired, but he continued teaching almost to the day of his death on April 3, 1925.

RETABLE, a term of ecclesiastical art and architecture, applied in modern English usage to an altar ledge or shelf, raised slightly above the back of the altar or communion table, on which are placed the cross, ceremonial candlesticks and other ornaments.

Retables may be lawfully used in the Church of England (*Liddell & Beale*, 1860, 14 P.C.).

RETAILING is that part of the distributive process which is concerned with selling goods directly to the ultimate consumer. The term "retailing," therefore, is broad. For example, it embraces even the direct-to-consumer sales activities of a producer who sells through his own retail stores, or by house-to-house canvassers, or by mail order, or by a combination of these methods; for such a producer is performing the retailing function.

The direct sale of goods to the individual or to the individual as a member of the family and for purposes of ultimate consumption constitutes the retailing activity. The ultimate consumer is the aim and contact of that activity. The goods sold may be bought by the seller, or handled on consignment, or produced. The types of goods sold in largest unit volume at retail are food products, clothing, clothing accessories, home furnishings and home equipment.

The principal activities involved in retailing are: (1) buying—providing stocks to meet consumer demand, quantitative and qualitative; (2) receiving and storing—checking, recording, marking prices on goods, caring for stock; (3) selling; (4) publicizing merchandise stocks—creating interior store and window displays, advertising, executing sales promotion programs; (5) providing customer services—delivering, caring for telephone and mail or-

ders, adjusting complaints, exchanging merchandise, maintaining customer restaurants, rest rooms, etc.; (6) managing the store personnel—employing, training, paying, supervising, executing welfare programs, etc.; (7) purchasing and caring for supplies—providing, stocking and controlling the use of such accessory materials as wrapping paper, bags, boxes, price tags, twine, tape, printed forms, etc.; (8) maintaining and caring for the building and its equipment; (9) financing the retailing operations; and (10) accounting for and controlling the operations.

The essential difference in the performance of these activities in large or small establishments lies in the much greater division of labour and organization possible in the large establishments.

While retailing is not exclusively confined to the four walls of a retail store, it is in the retail store that most retailing transactions take place (for example, probably not more than 2% of the total retail dollar volume is made up of sales by house-to-house canvassers). Using merchandise carried as a basis, retail stores are classified as: (1) single-line stores—groceries, or meats, or hardware, etc.; (2) multiple-line stores—combination food markets including meats, green vegetables, etc., and the modern drug store with its cigars, stationery, luncheonette and household convenience goods; (3) specialty stores—single-line stores carrying selected merchandise and catering to limited customer groups; and (4) department stores—stores that carry dry goods, apparel, furniture, housewares and almost any other type of consumer goods and that are departmentalized as to location, management and accounting. Still another useful classification—based upon ownership and control—is as follows: (1) independently-owned stores; (2) branch stores; (3) centrally-owned chain stores; (4) "voluntary" chain stores—units of independently-owned stores, associated with or without wholesaler affiliations for the purpose of conducting joint merchandising activities; and (5) consumers' co-operative stores.

A growing emphasis upon style, design and colour became characteristic of consumer demand and rapid changes in fashion affected retail stocking problems. The retailer has found it necessary to do an increased amount of "hand-to-mouth" buying (the ratio of year-end inventory to sales in retailing has generally decreased). There has been a steady increase in sales on "open account" and only an occasionally-interrupted gain in instalment retail sales in relation to total retail sales.

The department store failed to match the percentage increases in total retail sales in years of expansion and found it necessary to continue to affiliate and combine for the purpose of reducing overhead through research and merchandise costs through group or central buying. In those fields where the centrally-owned chain is strong, the independent retailer continued to associate with other independents and with wholesalers in "voluntary" chains to practice joint merchandising. In the food field there occurred the very spectacular rise of the supermarket under independent, old-line centrally-owned chain, and "new" chain sponsorship. There was a sharp decline in the number of true single-line retail stores and an increased experimentation with retailing a wide variety of merchandise at limited prices. The history of retailing in the U.S. has been one of experiment, improvement and progress. The department store, the mail-order house, the centrally-owned chain store, the "voluntary" chain, the supermarket, each in its turn, represents a new development in retailing to meet new needs under reasonably free competition. In the 1930s particularly there were increasing legislative restraints and regulations in the field of retailing.

However, even the discriminatory tax measures levelled at the centrally-owned chain stores, and so often widely supported by the independent retailer, failed to cripple the affected type of retailing or even to place it in a rigid mould. No important recession of "chain" business occurred in those states that taxed the centrally-owned chain. In the taxing states, the national food chains reduced the number of their outlets (most chain taxation is based upon the number of store units owned and operated) only slightly more than in the tax-free states. None of the three measures—size, sales or profits—suggested a general decline or "freezing" of the national centrally-owned chains. Flex-

ibly, they shifted from "long" systems (a large number of unit stores) to "large" systems (fewer units, but large volumes), from neighbourhood to shopping area, from limited merchandise assortments to wide varieties, even from complete central ownership to an affiliation of independents.

In retailing, whether conducted by chain or independent, by large establishment or small, the principal management problem was to find ways and means of spreading an increasing amount of overhead over as large a sales volume as possible. Enhanced wage levels, the trend toward shorter hours, social security burdens and increased taxes, all played a part in this problem. Moreover, there was the constant threat of higher prices that might represent more than gradual and nominal increases and that might restrict expansion in sales volume.

Successful retailing, therefore, demands an efficient functioning on the side of the ultimate consumer as his purchasing agent, rather than as a convenient storage depot or as a promoter of goods that some producer wants to sell. Careful buying, the assembly of broad assortments from which the customer can choose, the building of harmonious ensembles and merchandise relationships, the provision of qualities suited to utilitarian needs, the training and supervising of retail sales people with the aim of improving their assistance to the ultimate consumer in making wise choices—these are the essentials of profitable retailing. See CHAIN STORE; DEPARTMENT STORE. (G. R. C.; X.)

BIBLIOGRAPHY.—*Market Data Book, Consumer Markets Edition* (1942 et seq.); Curtis Publishing Co., *Where People Buy* (1942); C. W. Barker, *Principles of Retailing* (1942); N. A. Brisco, *Retailing* (1935).

RETAINER, properly the act of retaining or keeping for oneself, or a person or object which retains or keeps; historically, a follower of a house or family, and particularly used of armed followers attached to the barons of the middle ages.

Retainer of Counsel.—When it is considered desirable by a litigant that the services of any particular counsel (barrister) should be obtained for the conduct of his case, it is necessary to deposit with counsel a form of retainer together with the necessary fee in cash, from which time counsel is bound to give the party who has thus retained him the first call on his services in the matter in which he has been retained. Retainers are either general or special. A general retainer retains counsel for all proceedings in which the person retaining is a party. A special retainer is one which only applies to some particular cause or action. In the United States the retainer is much less formal than in England, and is used to refer to the preliminary fee given a counsel to take or defend proceedings.

See ADVOCATE; BARRISTER.

Retainer of Debt.—In connection with the administration of an estate under a will, it is the right of the personal representative—whether executor or administrator—of a deceased person to retain in respect of all assets which have come into his hands a debt due to himself in his own right whether solely or jointly with another person as against creditors of an equal degree, and this even though his debt is barred by the Statutes of Limitation (see Administration of Estates Act 1925, s. 34; *Taylor v. Deblouis*, Fed. Cas. no. 13,790). The appointment of a receiver deprives the representative of his right except in regard to assets which come to his hands prior to the appointment of the receiver.

RETENE, an aromatic hydrocarbon occurring in wood tars and obtained by distilling resinous woods. It crystallizes in colour-

less plates melting at 98.5° C. and boiling at 394° C. Chromic acid oxidizes the hydrocarbon to retene quinone (an ortho-diketone) and permanganate oxidizes the quinone to 3-hydroxy-isopropylidiphenyl-1:1':2':2'-tricarboxylic acid. These reactions show that retene is ethylisopropylphenanthrene, C₁₈H₁₈, with the adjacent structural formula.

See A. E. Everest, *The Higher Coal Tar Hydrocarbons* (1927).

RETFOED (officially EAST RETFOED), a market town and municipal borough in the Baseldale parliamentary division of Nottinghamshire, England, 138½ mi. N.W. from London on the Eastern Region Railway route. Pop. (est. 1938) 15,190. Area, 7.3 sq.mi. Retford (Redforde, Ratford) owes its importance to its position near one of the Roman roads and on the river Idle, where there was a ford. In 1086 the archbishop of York owned a mill at Retford, and Roger de Busli had rights there. Retford was a borough by prescription, and was in the hands of the crown when, in 1276, Edward I granted it to the burgesses in fee-farm with the right of electing bailiffs. This charter was confirmed by Edward III, Henry VI and Elizabeth I. In 1607 James I granted a charter of incorporation, under which the town was governed until 1835, when it was reincorporated. East Retford returned two members to parliament in 1315, and again from 1572 till 1885, when it was disfranchised.

There is a large trade in corn and cheese, and the town possesses iron foundries and works, paper and corn mills and rubber works. Coal is mined in the vicinity.

RETHEL, ALFRED (1876-1859), German historical painter, was born at Diepenbeek near Aix-la-Chapelle on May 15, 1816. At the age of 13 he executed a drawing which procured his admission to the academy of Düsseldorf, where he studied for several years. In 1836 he moved to Frankfurt, and was selected to decorate the walls of the imperial hall in the Römer with figures of famous men. Four years later he was commissioned to ornament the restored council house of his native city with frescoes from the life of Charlemagne, but the execution of this work was delayed for about six years. Meanwhile Rethel occupied himself with the production of easel pictures and drawings. In 1842 he began a striking series of designs dealing with the "Crossing of the Alps by Hannibal," in which the weird power which animates his later art became apparent. In 1844 Rethel visited Rome, executing, along with other subjects, an altar-piece for one of the churches of his native land.

Returning to Aix, in 1846, he commenced his Charlemagne frescoes. But mental derangement, remotely attributable to an accident in childhood, began to manifest itself. While he hovered between madness and sanity, Rethel produced some of his most impressive works. He painted "Nemesis Pursuing a Murderer," a flat stretch of landscape, with a slaughtered body, while in front is the assassin speeding away into the darkness and above an angel of vengeance. Another design which Rethel executed was "Death the Avenger," a skeleton appearing at a masked ball scraping daintily, like a violinist, upon two human bones; in contrast he produced "Death the Friend." Rethel also executed a powerful series of drawings—"The Dance of Death"—suggested by the Belgian insurrections of 1848. He died at Düsseldorf on Dec. 1, 1859.

His "Peter and John at the Beautiful Gate of the Temple," is in the Leipzig museum, and his "St. Boniface" and several cartoons for the frescoes at Aix are in the Berlin National gallery.

See his *Life*, by Wolfgang Müller von Königswinter (1851); *Art Journal*, Nov. 1865; monograph by Max Schmid in *Knackfuss's Künstlerbiographien*, vol. 32 (1898).

RETHEL, a town of France, capital of an arrondissement in the department of Ardennes, on the Aisne and the Ardennes canal, 31 mi. S.W. of Mézières by rail. Pop. (1946) 4,715. Rethel, of Roman origin, was from the 10th century the seat of a countship held successively by the families of Flanders, Burgundy, Clèves, Foix and Gonzaga.

In 1581 it was erected into a duchy in favour of the latter. In 1663 it was sold by Charles VI de Gonzaga to Mazarin, whose family held it until the Revolution. Rethel has a subprefecture, a board of trade arbitrators, chamber of arts and manufactures, and carries on wool spinning, the weaving of light woollen fabrics and the manufacture of farm implements.

RETREAT, a withdrawal, especially of a body of troops after a defeat or in face of a superior enemy. In military usage, retreat is the term for the ceremony at military posts of lowering the flag at or about sunset and also refers to the signal of the ceremony given by bugle or drum.

In religious usage, a retreat is a period and place set aside for prayer, self-examination and other spiritual exercises.

The word is also used of an institution or home where insane persons or habitual inebriates may be treated.

RETRENCHMENT, an act of cutting down or reduction, particularly of expenditure. A technical use of the term is in fortification, where it is applied to a work or series of works constructed in the rear of existing defenses in order to bar the further progress of the enemy should he succeed in breaching or storming these. For example, during the siege of Port Arthur in 1904, the Russians, after Fort Panlung fell to the Japanese, connected the two adjacent first-line forts to a fort in the rear by new works; the retrenchment remained in Russian hands until the fall of the whole line of forts.

RETZ, JEAN FRANÇOIS PAUL DE GONDI, CARDINAL DE (1614-1679), French churchman and agitator, was born at Montmirail in 1614. The family was one of those which had been introduced into France by Catherine de' Medici, but it acquired great estates in Brittany and became connected with the noblest houses of the kingdom. Retz himself always spelled his designation "Rals." He was the third son and was destined for the church. The family of Retz had military traditions, but it had also much church influence, and despite the unclerical leanings of the future cardinal, which were not corrected by the teachings of his tutor St. Vincent de Paul, the intentions of his family never varied respecting him.

He studied at the Sorbonne, and when he was scarcely 18 wrote the remarkable *Conjuration de Piesque*, a little historical essay, of which he drew the material from the Italian of Augustino Mascardi, but which is all his own in the negligent vigour of the style and the audacious insinuation, if nothing more, of revolutionary principles. Retz received no preferment of importance during Richelieu's life, and even after the minister's death, though he was presented to Louis XIII and well received, he found difficulty in attaining the coadjutorship with reversion of the archbishopric of Paris. But almost immediately after the king's death, Anne of Austria appointed him to the coveted post on All Saints' Eve, 1643.

Retz acquired great influence with the Parisians, which he gradually turned against Jules Mazarin. No one had more to do than Retz with the outbreak of the Fronde in Oct. 1648, and his history for the next four years is the history of that confused and, as a rule, much misunderstood movement. Of the two parties who joined in it Retz could only depend on the bourgeoisie of Paris. But although he had some speculative tendencies in favour of popular liberties, and even perhaps of republicanism, Retz represented no real political principle, and when the breakup of the Fronde came he was left in the lurch, having more than once in the meantime been in no small danger from his own party. One stroke of luck, however, fell to him before his downfall. He was made cardinal almost by accident and under a misapprehension on the pope's part.

In 1652 he was arrested and imprisoned, first at Vincennes, then at Nantes; he escaped, however, after two years' captivity, and for some time wandered about in various countries. He made his appearance at Rome more than once, and had no small influence in the election of Alexander VII. In 1662, he was received back again into favour by Louis XIV and on more than one occasion he served as envoy to Rome. Retz, however, was glad in making his peace to resign his claims to the archbishopric of Paris. In compensation he received the rich abbacy of St. Denis and restoration to his other benefices with the payment of arrears.

The last 17 years of Retz's life were passed partly in his diplomatic duties (he was again in Rome at the papal election of 1668), partly at Paris, partly at his estate of Commercy, but latterly at St. Mihiel in Lorraine. His debts were enormous, and in 1675 he resolved to make over to his creditors all his income except 20,000 livres, and, as he said, to "live for" them. He died in Paris on Aug. 24, 1679.

One of the chief authorities for the last years of the life of Retz is Madame de Sévigné, whose connection he was by marriage. Retz's *Memoirs* were certainly not written till the last ten years

of his life, and they do not go farther than the year 1655. They are addressed in the form of narrative to a lady who is not known, though guesses have been made at her identity, some even suggesting Madame de Sévigné herself. In the beginning there are some gaps. They display, in a rather irregular style and with some oddities of dialect and phrase, fine narrative skill and a high degree of ability in that special art of the 17th century—the drawing of verbal portraits or characters.

Retz sketched the early barricade of the Fronde in which the writer had so great a share, the hesitations of the court, the bold adventure of the coadjutor himself into the palace and the final triumph of the insurgents.

Beside these memoirs and the youthful essay of the *Conjuration de Piesque*, Retz left diplomatic papers, sermons, Mazarinades and correspondence.

The *Memoirs* of the Cardinal de Retz were first published in a very imperfect condition in 1717 at Nancy. The first satisfactory edition was that which appeared in the twenty-fourth volume of the collection of Michaud and Poujoulat (Paris, 1836). They were then re-edited from the autograph manuscript by Guezuez (Paris, 1844), and by Champollion-Figeac with the Mazarinades, etc. (Paris, 1859). In 1870 a complete edition of the works of Retz was begun by M. A. Fallet in the collection of *Grands Écrivains*. The editor dying, this passed into the hands of M. Gourdault, and then into those of M. Chantelauze, who had already published studies on the connection of St. Vincent de Paul with the Gondi family, etc. (1882). See also L. Batifol, *Le Cardinal de Retz* (1927).

REUBEN, according to Gen. xxix, 32, was the eldest son of Jacob, by his first wife, Leah. From this it may be inferred that at one time Reuben ranked as the foremost of the Hebrew tribes. But for reasons which are obscure the tribe lost this pre-eminence at an early period of the history. In Gen. xxv, 2 Reuben is said to have been intimate with his father's concubine, and the story, which breaks off abruptly, probably went on to record a curse pronounced upon him in consequence. This would be regarded as a sufficient explanation of the decline of the tribe (*cf.* Gen. xlix, 4, and see *I. Chron.* v, 1). It is possible that the story may be a personification of some aggressive move made by the tribe Reuben against the Bilhah clan. The subsequent history of the tribe is obscure. The territory which later traditions assign to it east of the Dead Sea is not clearly delimited or distinguished from the territories of Gad and Moab. A Reubenite name is found on the west of the Jordan (Josh. xv, 6; xviii, 17), and the reference to Reuben in the Song of Deborah (Judges v, 15-17) would naturally mean that Reuben was a pastoral tribe on the west of the Jordan, since of the next tribe mentioned it is definitely stated "Gilead abode beyond Jordan."

See C. F. Burney, *Israel's Settlement in Canaan*, pp. 50-52.

(W. L. W.)

REUCHLIN, JOHANN (1455-1522), German humanist and Hebraist, was born on Feb. 22, 1455, at Pforzheim in the Black Forest, where his father was an official of the Dominican monastery. The name was graecized by his Italian friends into Capion. Reuchlin constantly writes himself Porcensis. He learned Latin at the monastery school at Pforzheim, and spent a short time in 1470 at the university of Freiburg. His fine voice gained him a place in the household of Charles I, margrave of Baden, and he was chosen to accompany to the University of Paris the young prince Frederick. In Paris he learned Greek, and he attached himself to the leader of the Paris realists, Jean Heynlin, or à Lapide (d. 1496), whom he followed to the vigorous young university of Basel in 1474. At Basel Reuchlin took his master's degree (1477), and began to lecture, teaching a more classical Latin than was then common in German schools, and also explaining Aristotle in Greek. His Greek studies were continued at Basel under Andronicus Comnolabes, and he became acquainted with the bookseller, Johann Amorbach, for whom he prepared a Latin lexicon (*Vocabularius Breviloquus*, 1st ed., 1475-76). Reuchlin soon left Basel to study under George Hieronymus at Paris. He then studied law at Orleans (1478), and at Poitiers, where he became licentiate in July 1481. On his return to Germany he was engaged as interpreter by Count Eberhard of Württemberg, for a tour in Italy. They started for Florence and Rome in February 1482. His connection with the count became permanent,

and after his return to Stuttgart he received important posts at Eberhard's court. About this time he appears to have married, but little is known of his married life. He left no children; but in later years his sister's grandson Melancthon was almost as an son to him till the Reformation estranged them.

In 1490 he was again in Italy. Here he saw Pico della Mirandola, to whose Cabbalistic doctrines he afterwards became heir, and also made the friendship of the pope's secretary, Jakob Questenberg. On an embassy to the emperor Frederick at Linz in 1492, he began to read Hebrew with the emperor's Jewish physician Jakob ben Jehiel Loans. In 1494 his rising reputation had been greatly enhanced by the publication of *De Verbo Mirifico*.

In 1496 Eberhard of Württemberg died, and Reuchlin was glad to accept the invitation of Johann von Dalberg (1445-1503), bishop of Worms, to Heidelberg, which was then the seat of the "Rhenish Society." In this court of letters Reuchlin made translations from the Greek authors. He was during a great part of his life the real centre of all Greek teaching as well as of all Hebrew teaching in Germany. Reuchlin pronounced Greek as his native teachers had taught him to do, i.e. in the modern Greek fashion. This pronunciation, which he defends in *Dialogus de Recta Lat. Graecique Serm. Pron.* (1519), came to be known, in contrast to that used by Erasmus, as the Reuchlinian.

At Heidelberg Reuchlin had many private pupils, among whom Franz von Sickingen is the best known name. With the monks he had never been liked; at Stuttgart also his great enemy was the Augustinian Conrad Holsinger. On this man he took a scholar's revenge in his first Latin comedy *Sergius*, a satire on worthless monks and false relics.

Through Dalberg, Reuchlin came into contact with Philip, elector palatine of the Rhine, who employed him to direct the studies of his sons, and in 1498 sent him on a mission to Rome. He came back laden with Hebrew books, and found when he reached Heidelberg that a change of government had opened the way for his return to Stuttgart, where his wife had remained all along. His friends had now again the upper hand, and knew Reuchlin's value. In 1500, or perhaps in 1502, he was given high judicial office in the Swabian League, which he held till 1512, when he retired to a small estate near Stuttgart.

For many years Reuchlin had been increasingly absorbed in Hebrew studies, which had for him more than a mere philological interest for as a good humanist he could not rest satisfied with the Vulgate text of the Old Testament. In 1506 appeared his epoch-making *De Rudimentis Hebraicis*—grammar and lexicon—mainly after Kimhi, yet not a mere copy of one man's teaching. The edition was costly and sold slowly. One great difficulty was that the wars of Maximilian I. in Italy prevented Hebrew Bibles coming into Germany. But for this also Reuchlin found help by printing the Penitential Psalms with grammatical explanations (1512), and other helps followed from time to time. But his Greek studies had interested him in those fantastical and mystical systems of later times with which the Cabbala has no small affinity. Reuchlin's mystico-cabbalistic ideas and objects were expounded in the *De Verbo Mirifico*, and in the *De Arte Cabbalistica* (1517).

Unhappily many of his contemporaries thought that the first step to the conversion of the Jews was to take from them their books. This view had for its chief advocate the bigoted Johann Pfefferkorn (1459-1521), who secured the ear of the emperor Maximilian. In 1510 Reuchlin was summoned in the name of the emperor to give his opinion on the suppression of the Jewish books. He proposed that the emperor should decree that for ten years there be two Hebrew chairs at every German university for which the Jews should furnish books. The other experts proposed that all books should be taken from the Jews; and, as the emperor still hesitated, the bigots threw on Reuchlin the whole blame of their ill success. Pfefferkorn circulated at the Frankfurt fair of 1511 a gross libel (*Handspiegel wider und gegen die Juden*) declaring that Reuchlin had been bribed; and Reuchlin retorted as warmly in the *Augenspiegel* (1511). His adversary's next move was to declare the *Augenspiegel* a dangerous book; the Cologne theological faculty, with the inquisitor Jakob von Hochstraten (d. 1527), took up this cry, and on Oct. 7, 1512, they obtained an imperial

order confiscating the *Augenspiegel*. Reuchlin was timid, but he was honesty itself. He was willing to receive corrections in theology, which was not his subject, but he could not unsay what he had said; and as his enemies tried to press him into a corner he met them with open defiance in a *Defensio contra Calumniatores* (1513). The universities were now appealed to for opinions, and were all against Reuchlin. Even Paris (August 1514) condemned the *Augenspiegel*, and called on Reuchlin to recant. Meantime a formal process had begun at Mainz before the grand inquisitor, but Reuchlin by an appeal succeeded in transferring the question to Rome. Judgment was given in July 1516; and then, though the decision was really for Reuchlin, the trial was simply quashed. The result had cost Reuchlin years of trouble and no small part of his modest fortune, but the obscurantists received a crushing blow in Germany. No party could survive the ridicule that was poured on them in the *Epistolae Obscurorum Virorum*.

Reuchlin did not long enjoy his victory in peace. In 1519 Stuttgart was visited by famine, civil war and pestilence. Reuchlin sought refuge in Ingolstadt and taught there for a year as professor of Greek and Hebrew. He was now called to Tübingen and again spent the winter of 1521-22 teaching in his own systematic way. He died at the baths of Liebenzell on June 30, 1522, leaving in the history of the new learning a name only second to that of his younger contemporary Erasmus.

See L. Geiger, *Johann Reuchlin* (1871), which is the standard biography; also D. F. Strauss, *Ulrich von Hutten*; S. A. Hirsch, "John Reuchlin, the Father of the Study of Hebrew among the Christians," and his "John Pfefferkorn and the Battle of Books," in his *Essays* (London, 1905). Some interesting details about Reuchlin are given in the autobiography of Conrad Pellicanus (q.v.), which was not published when Geiger's book appeared. See also the article on Reuchlin in Herzog-Hauck, *Realencyclopädie*, and literature there cited.

RÉUNION, known also by its former name **BOURBON**, an island and French colony in the Indian Ocean, 400 m. S.E. of Tamatave, Madagascar, and 130 S.W. of Port Louis, Mauritius. It is elliptic in form and has an area of 970 sq. m. It lies between 20° 51' and 21° 22' S. and 55° 15' and 55° 54' E.

The coast-line is little indented, high and difficult of access and the harbours are usually sunken craters. The narrow coast-lands 2 to 3 km. wide are succeeded by hilly ground which gives place to mountain masses and tableland, which occupy the greater part of the island. The main axis runs N.W. and S.E., and divides the island into a windward (E.) district and a leeward (W.) district, the dividing line being practically that of the watershed. The whole relief is very complex owing to vulcanicity. First was formed a mountain whose summit is approximately represented by Piton des Neiges (10,069 ft.), an immense denuded crater, and at a later date another crater opened towards the E., piling up the mountain mass of Le Volcan. The oldest erupted rocks belong to the type of the andesites; the newest are varieties of basalt. The two massifs are united by high tablelands. In the older massif the most striking features are now three areas of subsidence—the cirques of Salazie, Rivière des Galets and Glacière, which lie N.W. and S. of the Piton des Neiges. The first, which may be taken as typical, is surrounded by high almost perpendicular walls of basaltic lava. Towards the S. lies the vast stratum of rocks which, on November 26, 1875, suddenly sweeping down from the Piton des Neiges and the Gros Morne, buried the little village of Grand Sable.

The second massif, Le Volcan, is cut off from the rest of the island by two "enclosures," each about 500 or 600 ft. deep. The outer enclosure runs across the island in a north and south direction; the inner forms a kind of parabola with its arms stretching E. to the sea and embracing not only the volcano proper but also the great eastward slope known as the Grand Brûlé. The 30 m. of mountain wall round the volcano is perhaps unique in its astonishing regularity. It encloses an area of about 40 sq. m. known as the Grand Enclos. There are two principal craters, each on an elevated cone,—the more westerly, now extinct, known as the Bory Crater (8,012 ft.), after Bory de St. Vincent, the geologist, and the more easterly called the Burning Crater or Fournaise (8,294 ft.). The latter is partially surrounded by an "enclosure" on a small scale with precipices 200 ft. high. Eruptions, though

not infrequent (thirty were registered between 1735 and 1860), are seldom serious; the more noteworthy are those of 1745, 1778, 1791, 1812, 1860, 1870, 1881. After 40 years of inactivity Fournaise was in eruption for four months from Dec. 1925 to April 1926. Hot mineral springs are found on the flanks of the Piton des Neiges: the Source de Salazie, 2,860 ft. above sea-level, has a temperature of 90° F. and discharges water impregnated with bicarbonate of soda, carbonates of magnesium, lime, iron, etc.; that of Cilaos is 3,650 ft. above the sea with a temperature of 100°; and that of Mafate 2,238 ft. and 89°.

Climate.—The year divides into two seasons—that of heat and rain from November to April, that of dry and more bracing weather from May to October. The prevailing wind is the south-east trade wind, which sometimes veers round to the south, and more frequently to the north-east; the west winds are not so steady (three hundred and seven days of east to fifty-eight of west wind in the course of the year). As over all the Indian Ocean cyclonic storms are frequent at the change of seasons. The *ras de marée* occasionally does great damage. The relief of the land causes quite appreciable climatic differences, the leeward side getting much less rain than the windward. On the coast and lower zones on the windward side the mean temperature is about 73° in the "winter" and 78° in the "summer." On the leeward side the heat is somewhat greater. In the Salazie cirque the mean annual average is 66°; at the Plaine des Palmistes 62°. On the mountain heights snow falls every year. In general, the higher parts of the island are healthy, but fever is prevalent on the coast.

Fauna and Flora.—The fauna of Réunion is not very rich in variety of species. The mammals are a brown mink (*Lemur mongoz*, Linn.) from Madagascar, several bats, a wild cat, the tang or tame (*Centetes setosus*, Denn.), rats, etc. Among the more familiar birds are the "oiseau de la vierge" (*Muscipeta borbonica*), the tectec (*Pratincola sybilla*), *Certhia borbonica*, the cardinal (*Foudia madagascariensis*), various swallows, ducks, etc. The visitants from Madagascar, Mauritius and even India are very numerous. Lizards and frogs of more than one species are common, but there is only one snake (*Lycoodon aulicum*) known in the island. Various species of *Gobius*, a native species of mullet, *Nestis cyprinoides*, *Ophronemus olivae* and *Doules rupestris* are among the freshwater fishes.

The heat, humidity and fertility of the volcanic soil have given Réunion an abundant and varied vegetation. In the forest region of the island there is a belt, 4,500–5,000 ft. above the sea, characterized by the prevalence of dwarf bamboo (*Bambusa alpina*); and above that is a similar belt of *Acacia heterophylla*. Besides this last the best timber-trees are *Casuarina laterifolia*, *Fostida mauritiana*, *Imbricaria petiolaris*, *Elaeodendron orientale*, *Colophyllum spurium* (red tacamahac), *Terminalia borbonica*, *Parikia speciosa*. A species of coffee plant is indigenous. Fruits grown are: the banana, the coco-nut, bread-fruit and jack-fruit, etc. Forests originally covered nearly the whole island; the majority of the land has been cleared, but the administration has in part replanted the higher districts with eucalyptus and caoutchouc trees.

Inhabitants.—Réunion, strictly speaking, has no indigenous population. The inhabitants include creoles, mulattoes, negroes, Indians and other Asiatics. The creole population is descended from the first French settlers, chiefly Normans and Bretons, who married Malagasy women. Three quarters of the inhabitants are of European origin. Three kinds of creoles are recognized—those of the towns and coasts, those of the mountains, and the *petits créoles*, originally a class of small farmers living in the uplands, now reduced to a condition of poverty and dependence on the planters. The *créoles blancs de villes*, the typical inhabitants of the island, are in general of a somewhat weak physique, quick-witted and of charming manners, brave and very proud of their island, but not of strong character. The creole patois is French mixed with a considerable number of Malagasy and Indian words, and containing many local idioms. The population, about 35,000 towards the close of the 18th century, numbered 197,933 in 1931, 208,850 in 1936, and of these 203,319 were French.

Towns and Communication.—St. Denis, pop. (1936) 30,762,

the capital of the island, lies on the N. coast. It is built in the form of an amphitheatre, and has several fine public buildings and centrally situated botanic gardens. The only anchorage for vessels is an open roadstead. St. Pierre (pop. 17,924), the chief town on the leeward side of the island, has a small artificial harbour. Between St. Pierre and St. Denis, and both on the leeward shore, are the towns of St. Louis (pop. 19,195) and St. Paul (pop. 21,485). A few miles N. of St. Paul on the S. side of Cape Pointe des Galets is the port of the same name, the only considerable harbour in the island. It was completed in 1886, it covers 40 acres, is well protected, and has 28 ft. of water. A railway serving the port goes round the coast from St. Pierre, by St. Paul, St. Denis, to St. Benoît (a town on the E. side of the island, pop. in 1936, 11,462), a distance of 83½ mi. Telegraphic communication with all parts of the world was established in 1906.

Industries.—The greater part of the land under cultivation on the island is occupied by sugar-cane plantations, the remainder being under either maize, manioc, potatoes, haricots, or coffee, vanilla and cocoa. The sugar-cane, introduced in 1711 by Pierre Parat, is now the staple crop. In the 18th century the first place belonged to coffee (introduced from Arabia in 1715) and to the clove tree, brought from the Dutch Indies by Poivre at the risk of his life. Both are now cultivated on a very limited scale. Vanilla, introduced in 1818, was not extensively cultivated till about 1850. Bourbon vanilla, as it is called, is of high character, and next to sugar is the most important article of cultivation in the island. There are small plantations of cocoa and cinchona; cotton-growing was tried, but proved unsuccessful.

The sugar industry has suffered greatly from the competition with beet sugar and the effects of bounties, also from the scarcity of labour, from the ravages of the phylloxera (which made its appearance in 1878) and from extravagant methods of manufacture. It was not until 1906 that steps were taken for the creation of central sugar mills and refineries, in consequence of the compulsory shutting down of many small mills. Rum is largely distilled and forms an important article of export. There are also manufactories for the making of geranium essence, St. Pierre being the centre of this industry. Other articles exported are also fibre and vases casks. The mineral wealth of the island has not been exploited, except for the mineral springs which yield waters highly esteemed. Cattle are imported from Madagascar; rice from Saigon and India; petroleum, for factories, from America and Russia; almost everything else comes from France, to which country go most of the exports. Over 75% of the shipping is under the French flag. Fishing is an important occupation.

Commerce.—In 1926 the exports were valued at 164,895,913 francs and the imports at 164,883,564 francs. The currency consists of notes of the Banque de la Réunion with a capital of 6,000,000 francs (guaranteed by the government) and nickel token money.

Administration and Revenue.—Réunion is regarded practically as a department of France. It sends two deputies and one senator to the French legislature, and is governed by laws passed by that body. All inhabitants, not being aliens, enjoy the franchise, no distinction being made between whites, negroes or mulattoes, all of whom are citizens. At the head of the local administration is a governor who is assisted by a secretary-general, a *procureur général*, a privy council and a council-general elected by the suffrages of all citizens. The governor has the right of direct communication and negotiation with the government of South Africa and all states east of the Cape. The council-general has wide powers, including the fixing of the budget. For administrative purposes the island is divided into two *arrondissements*, the Windward, with five cantons and nine communes, and the Leeward, with four cantons and seven communes. The towns are subject to the French municipal law. The 1926 budget gives receipts as 52,502,932 francs, expenditures 46,076,028 francs.

History.—Réunion is usually said to have been first discovered in April 1513, by the Portuguese navigator Pedro Mascarenhas, and his name, or that of Mascarene islands, is still applied to the archipelago of which it forms a part; but it seems probable that it must be identified with the island of Santa Apollonia discov-

ered by Diego Fernandes Pereira on Feb. 9, 1507. When in 1638 the island was taken possession of by Captain Gaubert, or Gobert, of Dieppe, it was uninhabited; a more formal annexation in the name of Louis XIII. was effected in 1643; and in 1649 Étienne de Flacourt repeated the ceremony. He also changed the name of the island from Mascarenhas to Bourbon. By decree of the Convention in 1793, Bourbon in turn gave place to Réunion, and though during the Empire this was discarded in favour of Ile Bonaparte, and at the Restoration people naturally went back to Bourbon, Réunion has been the official designation since 1848.

The first inhabitants were a dozen mutineers deported from Madagascar by Pronis, but they remained only three years (1646-49). Other colonists went thither of their own will in 1654 and 1662. In 1664 the *Compagnie des Indes orientales de Madagascar*, to whom a concession of the island was granted, initiated a regular colonization scheme. Their first commandant was Étienne Régnauld, who in 1689 received from the French crown the title of governor. The growth of the colony was very slow, and in 1717 there were only some 2,000 inhabitants. It is recorded that they lived on excellent terms with the pirates, who from 1684 frequented the neighbouring seas for many years. The French Revolution effected little change in the island and occasioned no bloodshed; the colonists successfully resisted the attempts of the Convention to abolish slavery, which continued until 1848 (when over 60,000 negroes were freed), the slave trade being, however, abolished in 1817. In 1809 the British attacked the island, and the French were forced to capitulate on July 8, 1810; the island remained in the possession of Great Britain until April 1815, when it was restored to France. From that period the island has had no exterior troubles. The Third Republic conferred the full rights of French citizenship including the vote on the negro population in 1870. The immigration of coolies began in 1860, but in 1882 the Government of India prohibited the further emigration of labourers from that country. Réunion suffered from disastrous cyclones in 1879 and 1904.

Mauran, *Impressions dans un voyage de Paris à Bourbon* (1850); Maillard, *Notes sur l'île de la Réunion* (1862); Azéma, *Hist. de l'île Bourbon* (1862). The geology and volcanoes of Réunion were the object of elaborate study by Bory de St. Vincent in 1801 and 1802 (*Voyages dans les quatre principales îles des mers d'Afrique*, 1804), and have since been examined by R. von Drasche (see *Die Insel Réunion*, etc., Vienna, 1878), and C. Vélain, *Descriptions géologiques de . . . l'île de la Réunion* . . . (1878).

REUNION, CHURCH. The movements for the Reunion of the Churches, especially among English-speaking Christians, are due mainly to two causes. In the first place, the reasons for division, which seemed once to be based on spiritual principles about which no compromise was possible, have grown fainter than they were. Few men cling to them so tenaciously as they did, e.g., in the 17th century. Secondly, there is a widespread feeling of the ineffectiveness of the churches in face of the tasks and problems of civilisation since the outbreak of the World War in 1914. To a large extent this is attributed to the divisions and consequent lack of unity of witness and aim among the churches themselves.

These movements for reunion are concerned with the divisions outside the Roman Catholic Church, which takes no part in them. On principle it cannot do so, as it has its own terms, surrender and not adjustment, from which there can be no departure.

An apparent exception to this statement occurred in what are known as the Conversations at Malines (1921-25). At the invitation of Cardinal Mercier a small body of English theologians met a similar body of Roman Catholic scholars for the purpose of exploring their grounds of difference. Begun quite un-

officially, at a later stage these conversations were held with the cognisance of the Archbishop of Canterbury. They were carried on in an atmosphere of friendship and respect; but the recent papal encyclical (1928) laid down the only terms of reunion with Rome: unconditional surrender.

The Church of England and the Orthodox Eastern Church.—Negotiations between the Church of England and the Eastern Orthodox Church for mutual recognition and fellowship have a fairly long history, but the pace has been quickened largely owing to events which followed the World War. In Jan. 1920, an Encyclical Letter was issued from the Patriarchate of Constantinople "unto all the Churches of Christ whosoever they be." It was an earnest plea for closer contact and better mutual understanding; and as a means to this end it suggested that there should be a uniform calendar for Christian feasts, intercourse between theological schools, exchange of students, impartial and more historical examination of doctrinal differences, etc. Following this, a "proposed concordat" was drawn up by the American Episcopal Church. After setting forth points of agreement in faith and order, it concludes:—

"In accordance with the preceding agreements, we do solemnly declare our acceptance of the sacramental acts each of the other, and that they are true and valid. And, holding fast the truth once delivered to the Saints, we pronounce that intercommunion is desirable and authorised for all our members wherever and whenever it is deemed convenient and practicable by the proper local and ecclesiastical authorities."

To this the locum tenens of the Oecumenical Patriarchate sent a sympathetic reply. The next step was the presence of a delegation of the Patriarchate at the Lambeth Conference in July 1920. Their subsequent report to the Holy Synod was marked by a good deal of reserve. The latitude of the Church of England proved to be a source of difficulty. The delegation also pointed out that the Lambeth Appeal puts forward "measures in relation to the non-episcopal Churches which also, in spite of goodwill, manifestly conflict with venerated principles and systems." Subsequently the Eastern Churches committee appointed by the Archbishop of Canterbury issued a statement of terms of intercommunion. In Feb. 1923, the Archbishop announced that the Holy Synod at Constantinople, after careful consideration, had decided in favour of the validity of Anglican ordinations. He pointed out, however, that this decision must be endorsed by all Patriarchates or by a General Council before it could become an oecumenical act.

The Church of England and the Free Churches.—The Lambeth Appeal, though addressed to all Christian people, has had its most important effect in the field of English ecclesiastical life. It has forced the great nonconformist bodies to reconsider their relations to the Church of England and the grounds of their separation, and to do so in an atmosphere of friendliness and goodwill. The terms on which the appeal believes that union is possible are as follows:—

"We believe that the visible unity of the church will be found to involve the whole-hearted acceptance of—

The Holy Scriptures, as the record of God's revelation of Himself to man, and as being the rule and ultimate standard of faith; and the Creed, commonly called Nicene, as the sufficient statement of the Christian faith, and either it or the Apostle's Creed as the baptismal confession of belief;

The divinely instituted sacraments of Baptism and the Holy Communion, as expressing for all the corporate life of the whole fellowship in and with Christ;

A ministry acknowledged by every part of the Church as possessing not only the inward call of the Spirit, but also the commission of Christ and the authority of the whole body."

It is claimed that the Episcopate is the one means of providing such a ministry. "But we greatly desire," it is added, "that the office of a Bishop should be everywhere exercised in a representative and constitutional manner, and more truly express all that ought to be involved for the life of the Christian family in the title of Father-in-God." These proposals have been the subject of prolonged discussion between representatives of the Church of

England on the one hand and a joint committee of the Federal Council of the Evangelical Free Churches (*q.v.*) and the National Free Church Council on the other, but so far no agreement has been found possible on two matters of essential importance, *viz.*, the use of the Creed and the necessity of episcopal ordination.

On the first point, the Free Church position is expressed in the resolutions adopted by the annual assembly of the Federal Council in Sept. 1922:—

"We regard the place given to the two ancient Catholic creeds as . . . subordinate to the inspired Word and living Spirit; and these creeds are received not as a complete expression of the faith, but as preserving 'essential elements' in it 'in the form handed down through many centuries, and with reasonable liberty as to their interpretation and their use. We hold as not only consistent with this, but as implied in it, alike the fullest freedom in the intellectual investigation of Truth and the most single-hearted discipleship to the Mind of Christ."

In regard to episcopal ordination the difficulty turns upon the question of the validity of the Free Church ministry. There is on the one hand a natural refusal to accept anything which implies that the Free Church minister must be re-ordained before he can administer valid sacraments in a united Church, and on the other there is disinclination on the part of the Church of England to advance beyond the admission that many Free Church ministries have been "manifestly blessed and owned by the Holy Spirit as effective means of grace," and consequently must be regarded as "real ministries of Christ's Word and Sacraments in the Universal Church," though they may be in varying degrees "irregular or defective."

General Results.—The difficulties indicated above are still unsolved, in spite of many discussions and explanatory statements marked by a very conciliatory spirit. In a memorandum signed by the Archbishops of Canterbury and York and the Moderator of the Federal Council in June 1925, it is stated that the joint conference believes that there should be a suspension of its activities in order that the documents already submitted may be studied with care. At its annual meeting in Sept. the Federal Council concurred, and at the same time recorded its conviction that the conferences which have taken place "have done much to bring representative members of the Churches concerned into closer fellowship and to a better understanding of each other's position; and, further, that they have prepared the way to further progress towards unity in the future."

METHODIST AND PRESBYTERIAN REUNION

Methodist Reunion.—The movement for reunion among the three branches of the Methodist Churches in England has reached a stage when it seems likely that it will soon be an accomplished fact. A scheme has been drawn up, and in 1924 the Wesleyan Conference, the Primitive Methodist Conference and the United Methodist Conference passed a practically identical resolution in the following terms:—

"The conference is of opinion that, provided the Methodist people desire the organic union of the three Methodist Churches concerned, the scheme now submitted (which is the result of prolonged deliberation and exhaustive inquiry) affords a basis of union which would ensure harmonious working without the sacrifice of any principle vital to Methodism. The conference therefore commends the scheme to the prayerful consideration of the Methodist people."

In 1925 the Wesleyan conference took the further necessary step of declaring in favour of the union of the three Methodist Churches, provided that substantial agreement can be secured as to the measures to be adopted for effecting union. The required agreement was secured, and the necessary Act of Parliament passed; and the union was effected on Sept. 20, 1932.

The Churches of Scotland.—The first step towards union between the Church of Scotland and the United Free Church of Scotland was taken in 1908, when the General Assembly of the Church of Scotland resolved "to request the other Presbyterian Churches to confer with them on the present ecclesiastical situation."

Conferences followed, and in 1914 a constitution was drafted under which the Church would be both national and free. No further progress was possible till 1919, owing to the War. In 1920, the articles of the constitution were approved and in July 1921, an Enabling Bill was passed by Parliament. Certain questions connected with the property and endowments of the Church of Scotland remained to be dealt with by a departmental committee appointed in 1922 and presided over by Lord Haldane. It reported in 1923, and its recommendations are embodied in The Church of Scotland (Property and Endowments) Bill of 1924. (On reunion in Canada see *METHODISM; PRESBYTERIANISM.*)

REUNION IN THE MISSION FIELD

The need for union in the mission field is illustrated by the negotiations between the Episcopal Synod of India and Ceylon and the South India United Church. The latter is a union of Christian congregations connected with the London Missionary Society and the American Board of Commissioners for Foreign Missions (both Congregational), the Church of Scotland, the United Free Church of Scotland, the Dutch Reformed Church in America and the Basel Mission. A joint committee was constituted in 1920 and several reports have been issued. As in England, the difficulty of agreement turned chiefly to the insistence upon episcopal ordination for all ministers of the United Church. It is suggested that the fact of episcopacy should be recognised without insistence upon any doctrine of its meaning, and that a joint service should be held to commission all ministers who desired full status in the United Church on reciprocally equal terms. The South India United Church also insists that it cannot allow itself to be cut off from these non-episcopal churches with which it is now in full communion.

It treasures its present catholicity too highly to take any step that would diminish or destroy the fellowship which it now enjoys with Evangelical Christendom.—(Resolution, Aug. 1923.)

A brief reference must be made to some of the movements of co-operation among different bodies of Christians, which have grown in strength and number since the end of the World War. Though these movements do not deal directly with the problem of reunion, the same motives lie behind them, *viz.*: a sense of the weakness of the Christian witness in the world due to division and a desire to co-operate in large fields of Christian enterprise which are recognised as common ground. (a) The World Alliance for promoting International Friendship through the Churches, founded at Constance on Aug. 2, 1914.

Its object is set forth in the following resolutions:—

1. That, inasmuch as the work of conciliation and the promotion of amity is essentially a Christian task, it is expedient that the Churches in all lands should use their influence with the peoples, parliaments and governments of the world to bring about good and friendly relations between the nations, so that, along the path of peaceful civilisation, they may reach that universal goodwill which Christianity has taught mankind to aspire after. 2. That inasmuch as all sections of the Church of Christ are equally concerned in the maintenance of peace and the promotion of good feeling among all the races of the world, it is advisable for them to act in concert in their efforts to carry the foregoing resolution into effect.

The Alliance consists of 28 national councils and is representative of the organised Christianity of the world with the exception of the Roman Catholic Church. The international committee meets once every three years. Its meetings in Copenhagen (1922) and Stockholm (1925) did much to focus Christian thought upon the question of peace. The expense of the international work of the Alliance is borne by the American Peace Union.

International Missionary Council.—The functions of this body are defined in the following resolutions adopted in 1921:—

1. To stimulate thinking and investigation on missionary questions, to enlist in the solution of these questions the best knowledge and experience to be found in all countries and to make the results available for all missionary societies and missions.

2. To help to co-ordinate the activities of the national mis-

siary organisations of the different countries and of the societies they represent, and to bring about united action where necessary in missionary matters.

3. Through common consultation to help to unite Christian public opinion in support of freedom of conscience and religion and of missionary liberty.

4. To help to unite the Christian forces of the world in seeking justice in international and inter-racial relations.

The Council is responsible for the publication of the *International Review of Missions*.

Universal Christian Conference.—The universal Christian conference on Life and Work held its first meeting at Stockholm in Aug. 1925. Six hundred and ten delegates were present, representing 31 communions and 37 nations. As a result, a message to all followers of Christ has been issued, setting forth the findings of the conference in the sphere of economics, of social morality and of international and inter-racial relationships. A continuation committee has been appointed.

REUS, a city of north-east Spain, in the province of Tarragona, on the Saragossa-Tarragona railway, 4 mi. N. of Salou, its port on the Mediterranean. Pop. (1940), 29,480 (mun. 32,285). Reus consists of two parts, the old and the new, separated by the Calle Arrabal, which occupies the site of the old city wall. The earliest records of Reus date from about the middle of the 13th century. Its modern prosperity is traced to about the year 1750, when a colony of English settled here and established a trade in woollens, leather, wine and spirits. The principal incidents in its political history arose out of the occurrences of 1843 (see SPAIN, History), in connection with which the town received the title of city, and Generals Zurbano and Prim were made counts of Reus. The city was the birthplace of General Prim (1814-1870) and of the painter Mariano Fortuny (1839-1874). The city has important flour, wine and fruit export houses.

REUSCH, FRANZ HEINRICH (1823-1900), German theologian, was born at Brilon, Westphalia, on Dec. 4, 1823. He studied general literature at Paderborn, and theology at Bonn, Tübingen and at Munich, where he was a friend and pupil of Döllinger. In 1854 he became *Privatdozent* in the exegesis of the Old Testament in the Catholic Theological Faculty at Bonn; in 1858 he was made extraordinary, and in 1861 ordinary, professor of theology in the same university. From 1866 to 1877 he was editor of the *Bonner Theologisches Literaturblatt*. In the controversies on the infallibility of the Pope, Reusch, who had been ordained priest in 1849, attached himself to Döllinger's party, and he and his colleagues Hilgers, Knoodt and Langen were interdicted by the archbishop of Cologne in 1871 from pursuing their courses of lectures. In 1872 he was excommunicated. For many years after this he held the post of Old Catholic *curs* of Bonn, as well as the position of vicar-general to the Old Catholic Bishop Reinkens, but resigned both in 1878, when, with Döllinger, he disapproved of the permission to marry granted by the Old Catholic Church in Germany to its clergy. He was made rector of Bonn university in 1873. In 1874 and 1875 he was official reporter of the Reunion Conferences held at Bonn. He produced with Döllinger the *Geschichte der Moralstreitigkeiten in der Römisch-Katholischen Kirche seit dem XVI. Jahrhundert, und die Erörterungen über Leben und Schriften des hl. Liguori*. He died on March 3, 1900.

REUSS, ÉDOUARD GUILLAUME EUGÈNE (1804-1891), German Protestant theologian, was born at Strasbourg on July 18, 1804. He studied philology in his native town (1819-22), theology at Göttingen under J. G. Eichhorn; and Oriental languages at Halle under Wilhelm Gesenius, and afterwards at Paris under Silvestre de Sacy (1827-28). He taught at Stras-

bourg from 1828 until 1838, for sixty years, having become full professor in 1836. His most important works are: *Geschichte der heiligen Schriften N. Test.* (1842), *Histoire de la théologie chrétienne au siècle apostolique* (1852); *L'Histoire du canon des saintes écritures dans l'église chrétienne* (1863); *La Bible, nouvelle traduction avec commentaire* (1874, etc.); and *Geschichte der heiligen Schriften A. Test.*, a veritable encyclopædia of the history of Israel from its earliest beginning till the taking of Jerusalem by Titus. He died at Strasbourg on April 15, 1891.

For many years Reuss edited with A. H. Cunitz (b. 1812) the *Beiträge zu den theologischen Wissenschaften*. With A. H. Cunitz and J. W. Baum (1809-1878), and after their death alone, he edited the monumental edition of Calvin's works (38 vols., 1863 ff.). His critical edition of the Old Testament appeared a year after his death.

See the article in Herzog-Hauck, *Realencyclopädie*, and cf. Otto Pöcherer, *Development of Theology in Germany since Kant* (1890).

REUSS the name of two former German principalities (Reuss-Greiz and Reuss-Schleiz-Gera) which were, after 1918, amalgamated into Thuringia (q.v.).

History.—The princes of Reuss traced their descent to Henry (d. about 1120), who was appointed by the emperor, Henry IV., imperial bailiff (Ger. *Vogt*, from Lat. *advocatus imperii*) of Gera and of Weida. His descendants called themselves lords of Weida. The land under their rule gradually increased in size, and it is said that the name of Reuss was applied to it owing to the fact that one of its princes married a Russian princess, their son being called *der Russe*, or the Russian. In 1564 the family was divided into three branches by the sons of Henry XVI. (d. 1535). One of these died out in 1616, but those of Reuss-Greiz and Reuss-Schleiz-Gera survived as sovereign houses till the revolution of 1918. The lords of Reuss took the title of count in 1673, and the head of the elder line became a prince of the empire in 1778, and the head of the younger line in 1806. In 1807 the two princes joined the confederation of the Rhine, and in 1815 the German confederation. In 1866 both principalities became members of the North German confederation.

A curious custom prevailed in the house of Reuss. The male members of both branches of the family all bore the name of Henry (Heinrich), the individuals being distinguished by numbers. See H. von Voss, *Die Ahnen des reussischen Hauses* (Lobenstein, 1884); O. Liebmann, *Das Staatsrecht des Fürstentums Reuss* (1884); C. F. Collmann, *Reussische Geschichte. Das Vogtland im Mittelalter* (Greiz, 1892); B. Schmidt, *Die Reussen, Genealogie des Gesamthauses* (Schleiz, 1923).

REUTER (rai'ter), **FRITZ** (1810-1874), German novelist, made Plattdeutsch a literary language. Born Nov. 7, 1810, at Stavenhagen, in Mecklenburg-Schwerin, he studied at Rostock and at Jena, where he was a member of the political students' club, or German Burschenschaft, and in 1833 was arrested in Berlin by the Prussian Government. Although the only charge which could be proved against him was that he had been seen wearing the Burschenschaft colours, he was condemned to death for high treason. The sentence was commuted to imprisonment for 30 years in a Prussian fortress. In 1838, through the personal intervention of the grand-duke of Mecklenburg, he was handed over to the authorities of his native state, and in 1840 was set free by a general amnesty.

In 1850 he settled as a private tutor at the little town of Trep-tow in Pomerania. Here he married Luise Kunze, the daughter of a Mecklenburg pastor. Reuter's first publication was a collection of miscellanies, written in Plattdeutsch, and entitled *Läuschen um Riemels* ("anecdotes and rhymes" 1853; a second collection followed in 1858). There followed *Polterabendgedichte* (1855), and *De Reist' nah Bellingen* (1855). In 1856 Reuter left Trep-tow and established himself at Neubrandenburg. His next book (published in 1858) was *Kein Häusgen*, an epic in which he presents with great force and vividness some of the least attractive aspects of village life in Mecklenburg. This was followed, in 1860, by *Hamme Näte um de litte Pudel*, the best of his verse compositions. In 1860 he published the first series of his *Olle Kamellen* ("old stories of bygone days"), which contained *Woans ich tau'ne Fru kam* and *Ut de Franzosenlid*. Later volumes were entitled *Ut*

mine Festungstid (1861); *Ut mine Stromtid* (3 vols. 1864); and *Dörchläuchting* (1866)—all written in the Plattdeutsch dialect of the author's home. *Ut mine Stromtid* is by far the greatest of Reuter's writings. *Ut de Franzosentid* describes the deep national impulse under which Germany rose against Napoleon. *Ut mine Stromtid* deals with the revolution of 1848.

In 1863 Reuter moved to Eisenach; and here he died on July 12, 1874.

Reuter's *Sämtliche Werke*, in 13 vols., were first published in 1863-68. To these were added in 1875 two volumes of *Nachgelassene Schriften*, with a biography by A. Wilbrandt; and in 1878 two supplementary volumes to the works appeared. A popular edition in 7 vols. was published in 1877-78 (new edition, 1902); there are also editions by K. F. Müller (18 vols., 1905), and W. Seelmann (7 vols., 1905-06). See *Briefe F. Reuters an seinen Vater*, ed. F. Engel (2 vols., 1895); A. Rämmer, *F. Reuter in seinem Leben und Schaffen* (1895); G. Raatz, *Wahrheit und Dichtung in Reuters Werken* (1895); E. Brandes, *Aus F. Reuters Leben* (1899); K. F. Müller, *Der Mecklenburger Volksmund und F. Reuters Schriften* (1902). A complete bibl. will be found in the *Niederdeutsche Jahrbuch* for 1896 and 1902.

REUTER, GABRIELE (1859-1941), German novelist, was born at Alexandria, Egypt, on Feb. 8, 1859. Her first novel, *Glück und Geld*, appeared in 1888. One of her early novels, *Aus guter Familie*, had reached its 25th edition in 1907. Among her works are *Frauenzellen* (1901); *Jugend eines Idealisten* (1916); and *Benedikta* (1923). She died at Weimar in Nov. 1941.

REUTER, PAUL JULIUS, BARON DE (1816-1899), founder of Reuters news agency, was born at Cassel, Germany. At the age of thirteen he became a clerk in his uncle's bank at Göttingen, where he met Gauss, whose experiments in telegraphy were then attracting some attention. In 1849 there was a gap between the end of the new German telegraph line at Aix-la-Chapelle and that of the French and Belgian lines at Verviers. Reuter organized a news-collecting agency at each of these places and bridged the interval by a pigeon-post. On the establishment of through telegraphic communication, Reuter endeavored to start a news agency in Paris, but finding that the French government's restrictions would render the scheme unworkable, removed in 1851 to England and became a naturalized British subject. The first submarine cable—between Dover and Calais—had just been laid, and Reuter opened a news office in London. At first, however, his business was practically confined to the transmission of private commercial telegrams to places not connected with the new system. He appointed agents at the telegraph termini on the Continent to forward these despatches by rail or pigeon-post to the addresses. His efforts to induce the English papers to publish his foreign news telegrams were unsuccessful, until in 1858 *The Times* published the report of an important speech by Napoleon III. forwarded by Reuter's Paris agent.

Reuter now extended his sphere of operations all over the world. He laid down a special cable from Cork to Crookhaven, Ireland, which enabled him to circulate news of the American Civil War several hours before steamers could reach Liverpool. A concession for a cable beneath the North Sea to Cuxhaven was granted him by the king of Hanover in 1865, and in the same year a concession was granted him for a cable between France and the United States, the line being worked jointly by Reuter and the Anglo-American Telegraph Company. Reuter was in 1871 given the title of baron by the duke of Saxe-Coburg and Gotha, and by a special grant of Queen Victoria he and his heirs were authorized to have the privileges of this rank in England. Reuter died at Nice on Feb. 25, 1899.

REUTERHOLM, GUSTAF ADOLF, BARON (1756-1813), Swedish statesman. After a brief military career he was appointed *Kammerherr* to Sophia Magdalena, queen consort of Gustavus III., and became intimately connected with the king's brother, Charles, then duke of Sudermania. He was imprisoned for a time in 1789 with other malcontents opposed to Gustavus III. On the death of Gustavus and the assumption of the regency by Charles he was made a member of the council of state and one of the "lords of the realm." His policy became increasingly reactionary and on the accession of Gustavus IV. he was expelled from Stockholm. He died in exile in Schleswig on Dec. 27, 1813.

See *Sveriges Historia* (Stockholm, 1877-81), vol. v.

REUTERS, the principal British and international news agency, founded in 1849 by Baron Paul Julius de Reuter (q.v.), who established a system of offices and correspondents throughout the world. He concentrated in London the news from these correspondents and then redistributed it. In 1865 Reuter transferred his business to a joint stock company, of which he became the governing director; he was succeeded in 1879 by his elder son, Baron Herbert de Reuter (1852-1915). Mark F. Napier was chairman of the company from 1912 to 1919, and in conjunction with him, Sir Roderick Jones, chairman and managing director, for national reasons arising out of World War I, converted the agency from a public company into a private trusteeship. This involved buying out the then existing shareholders for a sum of considerably over half a million sterling. Ten years later Sir Roderick reorganized the trusteeship in conjunction with the Press Association to ensure the passage ultimately of the complete ownership of Reuters to the newspapers of the United Kingdom. The principal news agency in every country in the world is affiliated with Reuters. Reuters' correspondents resident in the respective countries enjoy the exclusive call for Reuters' purposes upon the news of these agencies.

Where Reuters do not supply their telegrams direct to the newspapers, they deliver their service to these agencies to be disposed of by them in their territories. In addition to their services of imperial and foreign political news Reuters have greatly extended, especially to the Continent, to the East, the Far East and to the empire their services of commercial and financial prices and intelligence. (H. B. C.; X.)

REUTLINGEN, a German town, in the Swabian Alps of Württemberg, on the Echaz, an affluent of the Neckar, 36 mi. by rail S. of Stuttgart. Pop. (1939) 38,870. Reutlingen, which is first mentioned in 1213, became a free imperial town in the 13th century and was fortified by the emperor Frederick II. It came into the possession of Württemberg in 1802. Its industries include cotton spinning and weaving, dyeing and bleaching; also the manufacture of leather and machinery.

REVAL: see TALLINN.

REVELATION, BOOK OF: see APOCALYPSE.

REVELSTOKE, city, British Columbia, on the Columbia river, a key point on the Trans-Canada highway and a divisional station on the Canadian Pacific railway, 245 mi. N.E. of Vancouver. Pop. (1951) 2,908.

It is the supply centre for a mining and lumbering district, with railway shops, and is surrounded by rich fruit growing and ranching country.

A scenic motor road leads up Mt. Revelstoke to 5,000 ft. above the town.

REVENTLOW, CHRISTIAN DITLEV FREDERICK, COUNT (1748-1827), Danish statesman and reformer, born on March 11, 1748, was educated at Sörrö and Leipzig, and made an extensive tour of western Europe to study economic conditions before he returned to Denmark in 1770. In 1774 he held a high position in the *Kammerkollegiet*, or board of trade, two years later he entered the Department of Mines, and in 1781 he was a member of the *Overskattedirektionen*, or chief taxing board.

In 1784, he was placed at the head of the *Rentekammeret*, which took cognizance of everything relating to agriculture. He appointed a small agricultural commission to better the condition of the crown serfs, and among other things enable them to turn their leaseholds into freeholds.

Reventlow induced the Crown Prince Frederick, in July 1786, to appoint a grand commission to take the condition of all the peasantry in the kingdom into immediate consideration. This agricultural commission resulted in a series of reforms of the highest importance. The ordinance of June 8, 1787, modified the existing leaseholds, greatly to the advantage of the peasantry; the ordinance of June 20, 1788, abolished villeinage and completely transformed the much-abused *høveri* system whereby the feudal tenant was bound to cultivate his lord's land as well as his own; and the ordinance of Dec. 6, 1790, did away with *høveri* altogether. Reventlow also started public credit banks enabling small cultivators to borrow money on favourable terms.

But the financial distress of Denmark, the jealousy of the duchies, the ruinous political complications of the Napoleonic period, and, above all, the Crown Prince Frederick's growing jealousy of his official advisers, prevented Reventlow from completing his reforms. On Dec. 7, 1813, he was dismissed, and retired to his estates in Laaland, where he died on Oct. 11, 1827.

See Adolph Frederik Bergsøe, *Gren. C. D. F. Reventlows Virksomhed* (Copenhagen, 1837); Louis Theodor Alfred Bobe, *Elter. Papirer fra den Reventlowske Familie* (Copenhagen, 1895-97).

REVENUE, income, return, or profit; more particularly the receipts from all sources of a Government or State (O. Fr. *revenu*, from *revenir*, to return). The revenue of a State is largely made up of taxation, and the general principles of taxes are discussed in **TAXATION** and in a number of articles to which a guide will be found under **FINANCE**, **ARTICLES ON**. In some countries public or State domain may contribute substantially to the revenue, as do the forests in Russia, while in other countries important contributions are made from the State railways, post and telegraph services, etc. (See **EXCISE**; **ESTATE DUTIES**; **INCOME TAX**; **INHERITANCE TAX**; **STAMP DUTY**; **TARIFFS**; etc.)

REVERBERATORY FURNACE: see **FURNACE**, **METALLURGICAL**.

REVERE, PAUL (1735-1818), American engraver and patriot, was born in Boston, Mass., on Jan. 1, 1735. He had a meagre schooling, and in his father's shop learned the trade of a gold- and silversmith. In 1756 he was 2nd lieutenant of artillery in the expedition against Crown Point, and for several months was stationed at Ft. Edward, in New York. He became a proficient copper engraver, and engraved several anti-British caricatures in the years before the American revolution. He was one of the Boston grand jurors who refused to serve in 1774 because parliament had made the justices independent of the people for their salaries; was a leader in the Boston Tea Party; was one of the 30 north end mechanics who patrolled the streets to watch the movements of the British troops and Tories; and in Dec. 1774 was sent to Portsmouth, N.H., to urge the seizure of military stores there, and induced the colonists to attack and capture Ft. William and Mary—one of the first acts of military force in the war. His midnight ride from Charlestown to Lexington on April 18-19, 1775, to give warning of the approach of British troops from Boston, is Revere's most famous exploit; it is commemo-

THE HOUSE OF PAUL REVERE IN BOSTON, MASS.; BUILT ABOUT 1676, THE DIAMOND WINDOW PANES BEING A RESTORATION

rated by Longfellow, who, however, has "paid little attention to exactness of fact" (Justin Winsor). In 1775 Revere was sent by the Massachusetts provincial congress to Philadelphia to study the working of the only powder mill in the colonies, and although he was allowed only to pass through the building, obtained sufficient information to enable him to set up a powder mill at Canton. He was commissioned a major of infantry in the Massachusetts militia in April 1776; was promoted to the rank of lieutenant-colonel of artillery in November; was stationed at Castle William, defending Boston harbour, and finally received command of this fort.

He served in an expedition to Rhode Island in 1778, and in the following year participated in the unsuccessful Penobscot expedition. After his return he was accused of having disobeyed the orders of the commanding officer, was tried by court martial, and was acquitted. After the war he engaged in the manufacture of gold- and silverware, and became a pioneer in the production in America of copper-plating and copper spikes for ships. In 1795, as grand master of the Masonic fraternity, he laid the cornerstone of the new State House in Boston. He died in Boston on May 10, 1818.

See Charles F. Gettemy, *The True Story of Paul Revere* (Boston, 1905); E. Forbes, *Paul Revere and the World He Lived In* (1942).

REVERE, a city of Suffolk county, Massachusetts, U.S.A., on Massachusetts bay, adjoining Boston on the north-east. It is served by the Boston and Maine railway. The population of Revere in 1950 was 36,763; in 1940 it was 34,405; and in 1930 it was 35,680 by the federal census. It is primarily a residential suburb and resort, with some light manufacturing. Revere beach, extending from the promontory of Winthrop on the south to the Point of Pines on the north, is to Boston what Coney Island is to New York city. The first settlement there (called Rumney Marsh) was made in 1626. It was part of Boston until 1739, and then of the town of Chelsea until in 1846 North Chelsea was set off and incorporated as a separate town. In 1871 North Chelsea changed its name to Revere (in honour of Paul Revere) and in 1914 it was incorporated as a city.

REVEREND, a term of respect or courtesy, now especially used as the ordinary prefix of address to the names of ministers of religion of all denominations. The uses of *Mod. Lat. reverendus* do not confine the term to those in orders; Du Cange (*Glossarium s.v.*) defines it as *titulus honorarius, etiam mulieribus potioris dignitatis concessus*, and in the 15th century in English it is found as a term of respectful address.

In the Church of England deans are addressed as "very reverend," bishops as "right reverend" and archbishops as "most reverend." The moderator of the Church of Scotland is also styled "right reverend."

REVERSING LAYER, of the sun or stars, the layer where the absorption indicated by the dark lines in the spectrum occurs. The reversing layer proper lies near the top of the photosphere where the pressure is usually about one ten-thousandth atmosphere; but some of the dark lines are caused by absorption at higher levels in the chromosphere.

REVERSION, in biology, the phenomenon of an organism "throwing back" to some remote ancestor.

For reversion in law, see **REMAINDER**.

REVILLA GIGEDO, an isolated, uninhabited group of rocky islands in the North Pacific, 18° N., 112° W., belonging to Mexico and forming part of the state of Colima. They are about 420 mi. from the Mexican coast and comprise the large island of Socorro (San Tomás), 24 mi. long by an average of 9 mi. wide, and the three widely separated islets of San Benedicto, Roca Partida and Clarion, with a total area of 320 sq.mi. The island of Socorro has an extinct volcano 3,660 ft. high. The archipelago derives its name from the Spanish viceroy who governed Mexico from 1746 to 1755.

REVIVAL, RELIGIOUS, is a renewed interest in religion, coming, as a rule, after a period of indifference or decline. Revivalism and evangelism are frequently used as identical terms, but evangelism has a definite doctrinal connotation, emphasizing the objective atonement of Christ, the necessity of a new birth or conversion, and salvation through faith. Revivalism, on the other hand, connotes certain methods of presenting evangelical doctrine, and the religious awakening resulting therefrom.

Revivalism, in the modern sense, has its roots in 18th-century pietism, with its emphasis upon Christianity as an inner experience and a way of life. It was taken to the English colonies of America by pietistic Dutch, German Reformed and Lutheran pastors in the first third of the 18th century. The colonial revival began in 1725, under the preaching of Theodorus J. Frelinghuysen, a Dutch Reformed pastor in central New Jersey. Largely through the influence of William Tennent and the graduates of his "log college" the revival spread to the Scots-Irish settlers swarming across the

REWARD. In English law the offering of rewards presents two distinct aspects: (1) with reference to the nature of the information or act for the giving or doing whereof the reward is offered; (2) with reference to the nature of the relation created between the person offering and the person claiming the reward.

1. Courts of assize and quarter sessions are empowered to order the payment of rewards to persons who have been active in or towards the apprehension of persons charged with certain specified crimes against person and property (Criminal Law, 1826, ss. 28, 29; Criminal Justice Administration Act, 1851, ss. 7, 8). The rewards are payable according to a scale fixed by the home secretary. (See LARCENY.)

2. Where a reward is lawfully offered for information the person who first supplies the required information, i.e., satisfies the conditions on which the reward is payable, is entitled to recover by action the reward offered. Performance of the conditions is an acceptance of the offer (*Carill v. Carbolic Smoke Ball Co.*, 1893, 1 Q.B. 256, 270).

In the United States the law is practically the same.

REWARD, a town of British India, in Gurgaon district of the Punjab, 32 m. S.W. of Gurgaon. Pop. (1941) 30,673. It is an important centre of trade. The chief manufacture is brassware.

REWBELL, JEAN FRANÇOIS (1747-1807), French politician, was born at Colmar (then in the department of Haut-Rhin) on Oct. 8, 1747. He sat in the constituent and legislative assemblies and in the Convention. He took part in the reactionary movement which followed the fall of Robespierre, and became a member of the reorganized committees of public safety and general security. His moderation caused his election by 17 departments to the Council of Five Hundred. Appointed a member of the Directory on Oct. 1, 1795, he became its president in 1796, and retired in 1799. He then entered the Council of Ancients. After the coup d'état of 18 Brumaire he retired from public life, and died at Colmar on Nov. 23, 1807.

See L. Sciout, *Le Directoire* (1895-97).

REYMONT, WLADYSŁAW STANISŁAW (1868-1925), Polish novelist, was born at Kobieli Wielkie in the county of Piotrkow on May 6, 1868. He spent his youth in various occupations and his first novels were written when he was superintendent of a small railway sector. *The Comédienne* (1896, Eng. trans. 1921), *Ferments* (2 vol., 1897) and *Lily* (1899) were objective novels describing the every day life of a troupe of provincial actors. In 1899 appeared *The Promised Land* (2 vol., Eng. trans. 1928) modelled on Zola and describing industrialism in Łódź. Reymont's best-known work, *The Peasants*, appeared in four volumes 1904-09 (Eng. trans. 1925-26). He describes the four seasons' labours of a peasant and brings to light his primitive instincts, inward dignity and almost religious attachment to the land. This great peasant epic brought Reymont the Nobel prize for literature in 1924. While *The Peasants* was being prepared, a number of novels and short stories appeared, the most important of which are *Before Dawn* (1902), *Komurasaki* (1903), *From a Diary* (1903) and *The Storm* (1907). As a historical novelist, Reymont, primarily an observer of the direct processes of life, was less successful: the trilogy 1794 (*The Last Diet*, 1913; *Nil Desperandum*, 1916 and *The Insurrection*, 1918), though not lacking in literary merit, revealed a lack of historical exactness. He died on Dec. 5, 1925. (See POLISH LITERATURE.)

See I. Matuszewski, *Twórczości Twórcy* (Warsaw, 1904); Z. Debiński, *W. S. Reymont* (Warsaw, 1925); J. Lorentowicz, *Ludwik Reymont, prix Nobel 1924* (1925).

REYNARD THE FOX, a beast-epic, current in French, Dutch and German literature. The cycle of animal stories collected round the names of Reynard the Fox and Isengrim the Wolf in the 12th century seems to have arisen on the borderland of France and Flanders. The tales, like those of "Uncle Remus," were amusing in themselves; they were based on widely diffused folklore, and Reynard and his companions were not originally men disguised as animals. Jacob Grimm (*Reinhart Fuchs*, 1834) maintained their popular origin.

The principal names of the Reynard cycle were German. Reynard himself (Raginohardus, strong in counsel), Bruin the Bear,

Baldwin the Ass, Tibert the Cat, Hirscent the She-wolf, had German names, most of which were used as person-names in Lorraine. But it was in France that the cycle obtained its greatest vogue. The *Roman de Renart* as printed by Méon (4 vols., 1826) runs to over 40,000 lines. *Renart* was a popular epic parodying feudal institutions as represented in the romances of chivalry.

The early French originals are lost, the most ancient existing fragments being in Latin. The fable of the lion's sickness and his cure by the wolf's skin occurs in the *Ecclasis ejusdem capituli per Tropologium* (ed. E. Voigt; Strasbourg, 1875), written about 940. *Ysaingrimus* (ed. E. Voigt; Halle, 1884), a clerical satire written by Nivard of Ghent about 1148, includes the story of the lion's sickness and the pilgrimages of Bertilliana the Goat. Most later versions of Reynard have been derived from the Flemish *Van den vos Reynarde* (ed. E. Martin, Paderborn, 1874), written about 1250 in East Flanders by Arnout and Willem. The Flemish epic is a poem of 34,766 lines. The corresponding branch of the French *Roman de Renart* (for which see FRENCH LITERATURE) is one of the earliest and best of the great French cycle.

The fable was known in England. The English poem of the *Fox and the Wolf* dates from the 13th century; and the "Nonne Prestes Tale" of Chaucer in which, however, the fox is Roscel and the ass Brunel, is a genuine Reynard history. A Dutch version of the Reynard poem, *Hystorie van Reynaert die Vos*, was printed at Gouda in 1479. On this Caxton based his *Historie of reynart the foxe* (reprinted by E. Arber, 1878), which he finished on June 6, 1481. As a satire on the church, especially on monks and nuns, *Reynard* became popular with reformers, and numerous versions followed in England and Germany. The modern German version (1794) of Goethe has been often reprinted, notably in 1846, with illustrations by Wilhelm von Kaulbach.

BIBLIOGRAPHY.—The best edition of the *Roman de Renart* is by Ernest Martin (3 vols., Strasbourg and Paris, 1881-87). See also Jacob Grimm, *Sendschreiben an C. Lachmann über Reinhart Fuchs* (Leipzig, 1840); Léopold Sédaine, *Les Sources du roman de Renart* (Paris, 1890); Gaston Paris, "Le Roman de Renart" in the *Journal des savants* (Dec. 1894 and Feb. 1895); Kaarle Krohn, *Bir und Fuchs* (Helsingfors, 1888); H. Gagering, *Van den Vos Reynaerde* (Münster, 1920). A modernized version of Caxton's translation appeared in 1926.

REYNOLDS, JOHN FULTON (1820-1863), American soldier, was born at Lancaster (Pa.), Sept. 20, 1820, and graduated from West Point in 1841. He was breveted captain and major for gallantry in the Mexican War. In 1859 he was made commandant of cadets at West Point. At the outbreak of the Civil War in 1861 he was made a lieutenant colonel of infantry and some time later brigadier general of volunteers. In Nov. 1862, after having been in numerous actions, he was commissioned major general of volunteers, and appointed to command the I. Corps of the Army of the Potomac, took part in the battle of Fredericksburg and gave Gen. Meade his whole-hearted support in the three critical days preceding the battle of Gettysburg (q.v.). He was placed in command of the left wing and thrown forward to Gettysburg to cover the concentration of the army of the Potomac. The battle which ensued there, July 1, 1863, took its shape from Reynolds's resolution to support Buford's cavalry with the I and XI Corps. Reynolds himself was killed very early in the day by a rifle bullet. A bronze statue was placed on the field of Gettysburg and a portrait in the library at West Point by the name of the I. Corps. The State of Pennsylvania erected a granite shaft where he fell, and an equestrian bronze statue stands in Philadelphia.

REYNOLDS, SIR JOSHUA (1723-1792), the most prominent figure in the English school of painting, was born at Plympton Earl, in Devonshire, on July 16, 1723. He received a fairly good education from his father, who was a clergyman and the master of the free grammar school. At seventeen, the lad was apprenticed in London to Thomas Hudson, a native of Devonshire, who, though a mediocre artist, was popular as a portrait painter. Reynolds remained with Hudson for two years, and in 1743 he returned to Devonshire, where, settling at Plymouth Dock, he employed himself in portrait painting. By the end of 1744 he was again in London. He was well received by his old master, from whom he appears previously to have parted with some cold-

ness. Hudson introduced him to the artists' club that met in Old Slaughter's, St. Martin's Lane, and advised him as to his work. Reynolds now painted a portrait of Captain the Hon. John Hamilton, the first that brought him any notice, with those of other people of some repute.

Meanwhile Reynolds had made the acquaintance of Lord Edgumbe, who introduced him to Captain (afterwards Viscount) Keppel. Keppel was made aware of Reynolds' desire to visit Italy; and, as he had just been appointed to the command of the Mediterranean squadron, he invited the artist to accompany him in his ship, the "Centurion." The offer was gladly accepted. While Keppel was conducting his negotiations with the dey of Algiers, relative to the piracy with which that potentate was charged, Reynolds resided at Port Mahon, the guest of the governor of Minorca, painting portraits; and in December 1749 he sailed for Leghorn, and then made his way to Rome. Of the early Italians he praises the "simplicity and truth" and observes that they "deserve the attention of a student much more than many later artists." In Venice he made memoranda of the gradations of light and shade in the pictures, "and this without any attention to the subject, or to the drawing of the figures."

After more than two years in Rome, where he caught a severe cold which resulted in permanent deafness, Reynolds, in the spring of 1752, spent five months in visiting Parma, Florence, Venice and other important cities of Italy. Returning to England, Reynolds, after a brief stay in Devonshire, established himself as a portrait painter in St. Martin's Lane, London, whence he afterwards removed to Great Newport Street, and finally, in 1760, to Leicester Square, where he continued to paint till his death.

In London, Reynolds stepped at once into a foremost position as the fashionable portrait painter of the day. In this he was greatly helped by his success in society. Throughout his career his social occupations claimed the next place to his painting. Lord Edgumbe was a generous patron, and exerted himself to obtain commissions for his protégé, of whose ability the portraits which he now produced—especially the famous full-length of his old friend Keppel—were sufficient guarantee. In 1755 his clients for the year numbered 220, and in 1757 the number of sittings recorded reached a total of 677. He maintained his position unimpaired. During his year in London he had made the acquaintance of Dr. Johnson, which became a friendship for life. To him Burke and Goldsmith, Garrick, Sterne and Bishop Percy were before long added. Most of them were members of "The (Literary) Club," established at Reynolds' suggestion, in 1764.

In 1760 the London world of art was greatly interested by the novel proposal of the Society of Artists to exhibit its works to the public. In the month of April a successful exhibition was opened, the precursor of many that followed. Reynolds contributed four portraits. In 1765 the association obtained a royal charter, and became known as "The Incorporated Society of Artists"; but much rivalry and jealousy were occasioned by the management of the various exhibitions, and an influential body of painters withdrew from the society. They had access to the young king, George III., who promised his patronage and help. In December 1768 the Royal Academy was founded, and Reynolds, whose adhesion to the movement was for a time doubtful, was hailed by acclamation its first president. In a few months the king signified his approval of the election by knighting the new president, and intimating that the queen and himself would honour him with sittings for portraits to be presented to the Academy. Reynolds did not take any part in the educational work of the new institution, but on the social side he set the Academy on the lines it has followed with the greatest worldly success ever since. At his suggestion the annual banquet was instituted. To the specified duties of his post he added the delivery of a presidential address at the distribution of the prizes, and his speeches on these occasions form the well-known "Discourses." These discourses entitle their author to literary distinction; indeed, when they were first delivered, it was thought impossible that they could be the production of a painter, and Johnson and Burke have been credited with their composition, in spite of Dr. Johnson's indignant exclamation—"Sir Joshua, sir, would as soon get me to paint

for him as to write for him!"

Sir Joshua was too successful an artist to escape the jealousy of his less fortunate brethren, and it must be admitted that his attitude towards some of his contemporaries was wanting in generosity. His relations with Gainsborough, who on his part was in fault, would require more space for discussion than can here be afforded, but he was not just either to Hogarth or to Richard Wilson. Cosmo Monkhouse in the *Dictionary of National Biography* speaks of "the beauty of his disposition and the nobility of his character," but adds: "he was a born diplomatist." In 1784 Reynolds was appointed painter to the king.

In the summer of 1789 his sight began to fail; but he continued occasionally to paint till about the end of 1790, delivering his final discourse at the Academy on Dec. 10. On Feb. 23, 1792, the great artist passed peacefully away.

As a painter Reynolds stands, with Gainsborough, just behind the very first rank. There can be no question of placing him by the side of the greatest Venetians or of the triumvirate of the 17th century, Rubens, Rembrandt, Velasquez. He could not draw the figure properly; nor could he as a rule compose successfully on anything like a monumental scale.

He was all his life devoured by what he calls "a perpetual desire to advance." The weight and power of the art of Reynolds are best seen in those male portraits, "Lord Hestfield," "Johnson," "Sterne," "Goldsmith," "Gibbon," "Burke," "Fox," "Garrick," that are historical monuments as well as sympathetic works of art. In this category must be included his "Mrs. Siddons as the Tragic Muse," now in the Huntington Library and Art gallery, San Marino, Calif. (with a replica at the Dulwich gallery).

In portraits of this order Reynolds holds the field, but he is more generally admired for his studies of women and of children, of which the Althorp portraits of the Spencer family are classic examples. No portrait painter has been more happy in his poses for single figures, or has known better how to control by good taste the piquant, the accidental, the daring, in mien and gesture. "Viscountess Crosbie" is a striking instance. When dealing with more than one figure he was not always so happy, but the "Duchess of Devonshire and her Baby," the "Three Ladies decking a Figure of Hymen," and the "Three Ladies Waldegrave" are brilliant successes. He was felicitous too in his arrangement of drapery. Few painters, again, have equalled the Reynolds in dainty and at the same time firm manipulation of the brush. The richness of his deeper colouring is at times quite Venetian.

In the "Discourses" Reynolds unfolds his artistic theories. The first deals with the establishment of an academy for the fine arts, and of its value as a repository of the traditions of the best of bygone practice. In the second lecture the study of the painter is divided into three stages,—in the first of which he is busied with processes and technicalities, with the grammar of art, while in the second he examines what has been done by other artists, and in the last compares these results with Nature herself. In the third discourse Reynolds treats of "the great and leading principles of the grand style"; and succeeding addresses are devoted to such subjects as "Moderation," "Taste," "Genius," and "Sculpture." The fourteenth has an especial interest as containing a notice of Gainsborough, who had died shortly before its delivery; the concluding discourse is mainly a panegyric on Michelangelo.

His other literary works comprise his three essays in *The Idler* for 1759-1760 ("On the Grand Style in Painting," and "On the True Idea of Beauty"), notes to Du Fresnoy's *Art of Painting, Remarks on the Art of the Low Countries*, brief notes in Johnson's *Shakespeare*, and two singularly brilliant fragments, imaginary conversations with Johnson, which were never intended for publication, but, found among his papers after his death, were given to the world by his niece, the marchioness of Thomond.

Sir Joshua left to his niece, Mary Palmer, the bulk of his property, about £100,000, with works of art that sold for £30,000 more. There were, besides, legacies amounting to about £15,000. His body rests in St. Paul's.

In the United States, of the representative paintings by Reynolds, fourteen are in the Metropolitan Museum of Art, and others are as follows: New York Public Library, "Mrs. Billington

as 'St. Cecilia'; the Frick collection, New York city, "Lady Elizabeth Taylor" and "Lady Selena Skipwith"; the Frick Collection, Prides Crossing (Mass.), "Lady Cecil Rice"; "Lady Margaret Beaumont," and "Sir George Howard Beaumont"; the Joseph Widener Collection, Philadelphia, "Portrait of Lady Cornwall" and "Portrait of Nelly O'Brien"; Boston Museum of Fine Arts, "Kitty Fisher" and "Sir Thomas Mills"; A. E. Newton Collection, Philadelphia, "Samuel Johnson"; Chicago Art Institute, "Lady Sarah Bunbury"; Cleveland Museum of Art, "Portrait of Mrs. Corah"; Detroit Institute of Arts, "Sir Brooke Boothby, Bart."

Osborn, *Joshua Reynolds* (Künstler-Monographien, 1908).

REYNOLDS, STEPHEN (1881-1919), English author, was born at Devizes on May 16, 1881, and educated at Manchester university and the Ecole des Mines at Paris. He became sub-editor of an Anglo-French review in 1902, and in 1903 began an association with the Woolley brothers, fishermen of Sidmouth, becoming a recognized authority on fisheries. He was a member of the committee of enquiry into Devon and Cornwall Fisheries (1912), of the departmental committee on Inshore Fisheries (1913), and in that year was appointed adviser on Inshore Fisheries to the Development Commission. In 1914 he became resident inspector of fisheries for the southwestern area. He died at Sidmouth on Feb. 14, 1919. His books include *A Poor Man's House* (1908), a classic in its own kind; *Alongshore* (1910); *The Lower Deck, the Navy and the Nation* (1912); *The Holy Mountain* (a novel, 1909).

REYNOLDS, WALTER (d. 1327), archbishop of Canterbury, was the son of a Windsor baker, and became a clerk, or chaplain, in the service of Edward I. In 1307 Reynolds was appointed treasurer of England; in 1308 he became bishop of Worcester and in 1310 chancellor. When Robert Winchelsea, archbishop of Canterbury, died in May 1313 Edward II prevailed upon Pope Clement V to appoint his favourite to the vacant archbishopric, and Reynolds was enthroned at Canterbury in Feb. 1314. He continued the struggle for precedence between the archbishops of Canterbury and of York and in 1317 he laid London under an interdict after William de Melton (d. 1340), archbishop of York, had passed through its streets with his cross borne erect before him. Reynolds remained in general loyal to Edward II until 1324, when with all his suffragans he opposed the king in defense of the bishop of Hereford, Adam of Orton. In the events which concluded Edward's life and reign the archbishop played a contemptible part. Having fled for safety into Kent he returned to London and declared for Edward III, whom he crowned in Feb. 1327. He died at Mortlake on Nov. 26 following.

REZANOV, NICOLAI PETROVICH DE (1764-1807), Russian administrator under Catherine II, Paul I and Alexander I. He was the first Russian to represent his country in Japan (1804), and instigated the first attempt of Russia to circumnavigate the globe (1803), commanding the expedition himself as far as Kamchatka. But Rezanov's monument for many years after his death was the great Russian-American Fur company; and his interest to students of history centres round the policy involved in that enterprise.

Meeting (in 1788) Shelikov, chief of the Shelikov-Golikov Fur company, Rezanov became interested in the merchant's project to obtain a monopoly of the fur trade in those distant dependencies. He became a partner, and, after the death of Shelikov in 1795, the leading spirit of the company, and resolved to obtain

privileges analogous to those granted by Great Britain to the East India company. He had just succeeded in persuading Catherine to sign his charter when she died, and he was obliged to begin again with the ill-balanced and intractable Paul. Rezanov's skill, subtlety and address prevailed, and shortly before the assassination of Paul he obtained his signature to the instrument which granted to the Russian-American company, for a term of 20 years, dominion over the coast of N.W. America, from latitude 55° northward; and over the chain of islands extending from Kamchatka northward and southward to Japan. This famous "trust," which crowded out all the small companies and independent traders, was a source of large revenue to Rezanov and the other shareholders, including members of the imperial family, until the first years of the 19th century, when mismanagement and scarcity of food threatened it with ruin. Rezanov, his humiliating attitude to Japan, and his attitude toward the Russians, and the company, were the subject of a bitter polemic in the Russian capital, as typical of the general attitude of the company and of the government toward the natives of the colonies. He was expelled from Japan in 1805.

At the end of the 18th century the company of the Columbia river had for its principal object the trade in furs, and to realize this purpose the American and Russian was to trade with, and obtain a monopoly of, the natives of the Columbia basin, a year from New Spain. He was expelled from the colony in 1805. He had defeated his intention to take possession of the Columbia river in the name of Russia. Although he was received with courtesy, he was told that the laws of Spain forbade her colonies to trade with foreign powers, and that the governor of all the Californias was incorruptible. Rezanov, had it not been for a love affair with the daughter of the *comandante* of San Francisco, Don José Argüello, and for his personal address and diplomatic skill, with which he won over the clergy to his cause, would have failed again. As it was, when he sailed for Sitka, six weeks after his arrival, the "Juno" held full weight of breadstuffs and dried meats, he had the promise of the perplexed governor to forward a copy of the treaty to Spain at once, and he was affianced to the most beautiful girl in California. Shortly after his arrival in Sitka he proceeded by water to Kamchatka, where he dispatched his ships to wrest the island Sakhalin of the lower Kurile group from Japan, then started overland for St. Petersburg to obtain the signature of the tsar to the treaty. He died of fever and exhaustion in Krasnoyarsk, Siberia, on March 8, 1807.

The treaty with California, the bare suggestion of which made such a commotion in New Spain, was the least of Rezanov's projects. It was sincerely conceived, for he was deeply and humanely concerned for his employees and the wretched natives who were little more than the slaves of the company. His correspondence with the company betrays a clearly defined purpose to annex to Russia the western coast of North America, and encourage immediate emigration from the parent country on a large scale. Had he lived, he might have accomplished his object. The treaty was never signed, the reforms of Rezanov died of discouragement, the fortunes of the colonies gradually collapsed, the Spanish girl who had loved Rezanov became a nun; and one of the ablest and most ambitious men of his time was forgotten in the cemetery of a poor Siberian town.

Russell, ed., *The Rezanov Voyage to Nueva California* (1916); A. Verzinitsky, "A Rambling Note on the Russian Columbus," *New York Public Library Bulletin*, vol. xxxi (1927). (G. Ar.)

REZEKNE, a town of Latvia in 56° 30' N., 27° 20' E., at a railway junction between north-south and east-west lines. In spite of its position on the railway, it has not much trading importance and its pop. in 1939 was only 13,139. Founded in 1285, under the name of Rozitten, by the Teutonic Knights as a fort against the Lithuanians and Letts, the position of the town has rendered it perpetually subject to attack. In 1561 the Teutonic Knights gave it in pawn to Poland and, though captured by the Russians in 1567 and 1577, and dismantled by the Swedes during

the war of 1656-60, it continued Polish till 1773, when White Russia was united with the Russian empire. During 1914-20 the town was in the war zone and suffered severely. Rule passed to Latvia in 1918, the U.S.S.R. in 1940, and Germany in 1941.

REZONVILLE, BATTLE OF. The name given by the French to the battle of Vionville-Mars-la-Tour in the Franco-German War (q.v.). See also METZ.

RHADAMANTHUS, in Greek mythology, son of Zeus and Europa, and brother of Minos, king of Crete. Homer represents him as dwelling in the Elysian fields (*Odyssey*, iv. 564). According to later legends, on account of his inflexible integrity, he was made one of the judges of the dead in the lower world, together with Aeacus and Minos.

RHAETO-ROMANCE LANGUAGES. The Rhetic, or Rhaetic, idioms consist of several patois which form three distinct groups separated one from another by tracts of territory in which German and Italian are spoken. They represent the Latin spoken in Raetia, whither it was first brought by the legions of Tiberius and Drusus (subjugation of Raetia 15 B.C.), and the Latin spoken in Noricum after the tribes inhabiting that country had been defeated by Publius Silius (16 B.C.). From the close of the 5th century Raetia and Noricum became the scene of numerous migrations and Germanic invasions; cut off from the neighbouring romance-speaking populations (French and Italian) they pursued an evolution of their own. They fought hard and ceaselessly to maintain themselves against German and Italian inroads and assaults, but the long struggle resulted in a considerable diminution and disaggregation of the once very extensive and compact Rhaeto-romance domain. The study of documents of diverse kinds and resourceful philological device have established the foregoing facts, the data for which have been recently assembled by C. Pult in a paper entitled "Raetia Prima in the Middle Ages."

There is evidence, for instance, of traces of romanization persisting round the Lake of Constance even after the eighth century, while at the same time there were still compact groups of *Romani* in the district of Salzburg. In certain areas of central and eastern Tirol, Latin held out beyond the 13th century, and in western Tirol beyond the 16th; it subsisted, indeed, later still in various localities round Venosta and Montafon. On the Rhine the country round Ragaz and Pfäfers remained almost undisturbedly romance down to the 17th century and in this region the Rhetic dialect lived on till the close of the same century. Sargans, Mels and the principality of Liechtenstein were Germanized at an earlier period. The district of Werdenberg up to Buchs as well as Flums with its environs, as regards romanization, appear to have been in like condition with Ragaz. North of Buchs as far as Hirschenprung the traces of romanization are less numerous. In the Glaris canton Germanization did not take place before the 11th century, and romance survived until considerably later in Kerenzerberg, on the south bank of the Lake of Walenstadt. The Unseren valley continued romance beyond the 11th century. In the Grisons canton, Prättigau and Schamsfeg retained their Rhetic dialect till the beginning of the 15th century. The chief town of Grisons, Coire (Chur) clung to Latin till the beginning of the 15th century. The Rhetic dialect is at present in process of extinction in the basins of the Noce and Avisio.

Manifold reasons explain this gradual shrinkage of the Rhetic idioms: their lack of cohesion, the multiplicity of patois presenting exceptional divergences between places not far apart, the impossibility of efficient literary output for lack of any predominant dialect, their state of general inferiority as towards the strongly constituted languages by which they have been ousted. In these circumstances, the activity displayed by the Rhetic idioms is the more remarkable. Their literature, an entirely artificial product, counts many poets of talent.

The three groups of Rhetic idioms are constituted as follows:—

I. WESTERN GROUP.—Till recently this group was subdivided into *Romansh* and *Engadiner*. The classification now adopted is into (1) *Sursilvanian*, from the sources of the Rhine to Trins; (2) *Central Grison*, including *Subsilvanian* and *Surmeirian* (*super murum*); (3) *Engadiner*, including *Upper Engadiner* and *Lower Engadiner* (with the valley of Münster). A noteworthy fact

with regard to this group is that whereas between 1850 and 1890 the population composing it declined from 42,436 to 36,472, it had risen to 37,662 in 1910 and to 39,029 in 1920.

II. CENTRAL GROUP.—This includes the patois of (1) the *Burgavio* (*Burggrafenamt*), (2) the basin of the Noce, (3) the basin of the *Avisio*, (4) *Linvalongio*, (5) *Ampezzo*, (6) *Comelico*, (7) the basin of the *Gardera*, (8) *Gardena*, (9) *Pusteria*, (10) the valley of the *Isarco* (11) and of the *Rienza*; about 12,000 souls.

III. EASTERN GROUP.—Constituted by *Friulian*, at present spoken by some 450,000 persons in the province of Udine. This is divided by C. Battisti as follows:—1. *Friulano del Piano*, including (a) the *Udinese-goriziano* group; (b) the *Sacilese* group (strongly penetrated with Venetian). 2. *Friulano della Carnia*, including (a) group of the *Degano*; (b) group of the *But*; (c) group of the *Fella*; (d) the *Toizzano-gemonese* group, which might also be called "prealpino." (L. B.)

RHAGES: see RAVY.

RHAMNACEAE, the buckthorn family, a group of dicotyledonous plants in the warmer parts of both hemispheres, consisting of 45 genera and about 700 species of shrubs, woody vines and trees. Large genera are *Rhamnus* with about 230 species, *Zizyphus* with 100 species and *Physalis* with 90 species. *Jujube* (q.v.), or the Chinese date, native of Asia, is the fruit of *Zizyphus jujuba* (*Z. vulgaris*), and the Indian jujube is the fruit of *Z. mauritiana*. The bark of various species of *Rhamnus* is utilized in the practice of medicine, cascaro sagrada (q.v.), being that of the western American *R. purshiana*. *Ceanothus*, a genus highly developed in the western United States, is known as the California lilac. See also BUCKTHORN. (E. D. M.)

RHANKAVES (commonly also RHANGAVE), **ALEXANDROS RHIZOS** (1810-1892), Greek savant, poet and statesman, was born at Constantinople of a Phanariot family on Dec. 25, 1810. He was educated at Odessa and the military school at Munich. Having served as an officer of artillery in the Bavarian army, he returned to Greece. He subsequently became ambassador at Washington (1867), Paris (1868), and Berlin (1874-1886), and was one of the Greek plenipotentiaries at the congress of 1878. After his recall he lived at Athens, where he died on June 29, 1892. He was the chief of a school of literary men whose object was to restore so far as possible the ancient classical language. Of his various works the most important are *Hellenic Antiquities* (1842-1855), *Archaeologia* (1865-1866), an illustrated *Archaeological Lexicon* (1888-1892), and a *History of Modern Greek Literature* (1877).

A complete edition of his philological works in 19 volumes was published at Athens (1874-90), and his *Απομνημονεύματα* (Memoirs) appeared posthumously in 1894-95.

See Sandys, *History of Classical Scholarship*, vol. iii.

RHAPSODIST, originally an epic poet who recited his own poetry; then, one who recited the poems of others (see HOMER).

THE RHEA (RHEA AMERICANA), FOUND ONLY IN SOUTH AMERICA

RHATANY OR KRAME-RIA ROOT, in medicine, the dried root either of *Para* or of *Peruvian* rhatany. Its action is due to rhatania-tannic acid, and resembles that of tannic acid, being a powerful astringent. An infusion is used as a gargle for relaxed throats; and lozenges, particularly those containing rhatany and cocaine, are useful in similar cases. The powdered extract may be applied as a local haemostatic. All preparations of rhatany taken internally are powerful astringents in diarrhoea and intestinal haemorrhage.

RHEA, the American "ostrich." A Rattie bird confined to South America. Three species are recognized: *R. americana*, ranging from Paraguay to Patagonia; *R. darwini*, confined to Patagonia; and *R. macrorhyncha*,

of northeast Brazil. Considerably smaller than the ostrich, the rheas are further distinguished by the possession of three toes, the absence of fine plumes and the general brownish colour of the feathers, which, in *R. darwini*, are tipped with white. The feathers have a considerable market value. The rhea is polygamous, and the cock bird performs the duties of incubation. Rheas frequently associate with deer or guanacos to form "mixed herds" similar to those formed by the ostrich with zebras and antelopes. See also BIRDS; OSTRICH.

See C. R. Darwin, *Voyage of the Beagle*; Cunningham, *Natural History of the Straits of Magellan*.

RHEA, a Titaness, sister and consort of Cronus and mother of Zeus. For her legend, see CRONUS. Very little cult of Rhea existed, but she was commonly identified in historical times with Cybele (see GREAT MOTHER OF THE GODS). Hence such legends as that in Virgil (*Aen.*, iii, 111), that Cybele originally came from Crete; and indeed the various mother goddesses of the Mediterranean, while not actually the same, closely resemble one another and are the product of the same class of ideas and practices.

RHEINBERGER, JOSEPH GABRIEL (1839-1901), German composer, was born at Vaduz, Liechtenstein, on March 17, 1839. He studied at the Munich conservatorium from 1851 to 1854, and in 1859 became a professor there. He was from 1860 to 1866 organist of the Michaelskirche, and then court conductor. His compositions include the operas *Die sieben Raben* (Munich, 1866) and *Türmer* (Munich, 1866) and *Türmer's Töchterlein* (Munich, 1873); the oratorio *Christoforus*, op. 120; the well-known quartet for piano and strings in E flat, op. 38; the nonet for wind and strings, op. 139; and 20 organ sonatas. Rheinberger's organ music is original in method, and breaks loose from the Bach tradition in many points. He died at Munich on Nov. 25, 1901.

RHENANUS, BEATUS (1485-1547), German humanist, was born in 1485 at Schlettstadt in Alsace, where his father, a native of Rheinau (hence the surname *Rhenanus*), was a butcher. He was educated at the famous Latin school of Schlettstadt, and afterward (1503) went to Paris. In 1511 he removed to Basel, where he became intimate with Erasmus, and took an active share in the publishing enterprises of Joannes Froben (q.v.). In 1526 he returned to Schlettstadt, and devoted himself to a life of learned leisure, enlivened with epistolary and personal intercourse with Erasmus (the printing of whose more important works he superintended) and many other scholars of his time. He died at Strasburg on July 20, 1547.

His earliest publication was a biography of Geiler of Kaisersberg (1510). Of his subsequent works the principal are *Reum Germaniarum Libri III* (1531) and editions of *Velleius Paterculus* (ed. princeps, from a manuscript discovered by himself, 1521); *Zacutus* (1519, exclusive of the *Histories*); *Livius* (1535); and *Erasmus* (with a life, 9 vol., 1540-41).

See A. Hornwiltz, *Beatus Rhenanus* (1872) and *Des Beatus Rhenanus Historische Tätigkeit*, 2 vol. (1872); also the notice by R. Hartfelder in *Allgemeine deutsche Biographie*.

RHENIUM (symbol Re, atomic number 75, atomic weight 186.31) is a very rare metallic element discovered by Ida and Walter Noddack in 1925. There are two naturally occurring isotopes with mass numbers: 185, which is stable, and 187, which is radioactive and the more abundant; radioactive isotopes with mass numbers 182, 183, 184, 186 and 188 have been prepared. The arrangement of electrons in the unfilled orbits (O and

P) is: $5s^2, 5p^6, 5d^5, 6s^2$.

Rhenium is widely distributed but only in traces in various minerals and especially in certain sulphide ores containing molybdenum. It is probably present as its stable disulphide, ReS_2 . When the ores are smelted, the rhenium becomes concentrated in residues or flue dust, as a result of the volatility of its oxide.

The element is extracted from these and finally purified by the recrystallisation of potassium perhenate, $KReO_4$, which is only slightly soluble in water. The metal is obtained as a dark gray or black powder by reducing $KReO_4$ at a moderate temperature in hydrogen. The powder is washed with water to remove KOH and is again reduced at a higher temperature. The careful reduction of ammonium perhenate gives a better product. Like tungsten, which it resembles, this powder can be compressed and sintered in hydrogen at a temperature near its melting point ($3,150^\circ C.$) to produce massive metal with a density in excess of 19. The solid metal has a density of 21. It is much harder than tungsten, even at high temperatures. It oxidizes if heated in the air above $150^\circ C.$ and at high temperatures emits clouds of the volatile oxide, Re_2O_7 . This, however, is not poisonous like the volatile oxide of osmium. The metal is not soluble in hydrochloric acid, but dissolves readily in nitric acid, forming perhenic acid. Numerous salts of this acid have been studied.

Since rhenium forms compounds in which it shows a wide range of valencies, a number of oxides exist in addition to the most stable yellow heptoxide, Re_2O_7 . These include the insoluble red trioxide, Re_2O_3 , the black dioxide, ReO_2 , and the black sesquioxide, Re_2O_5 . Compounds are formed when rhenium is heated in the presence of such elements as sulphur, phosphorus or arsenic. Like tungsten (q.v.), it forms numerous anhydrous halides or oxyhalides with fluorine, chlorine or bromine, which are hydrolyzed by water. The trichloride, $ReCl_3$, is a red solid which, on heating, gives a green vapour, from which metal deposits can be obtained on hot filaments of platinum or tungsten by thermal decomposition. A number of alloys containing rhenium are known.

RHEOBASE: see CHRONAXIS.

RHEOSTAT, a device that is used for readily varying the resistance of an electric circuit.

RHESUS MONKEY (*Macaca mulata*), probably the best known of all monkeys, a native of India. It is brown in colour, with long hair and a naked area on the buttocks, and is gregarious. (See MACAQUE.)

RHETICUS or **RHAETICUS** (1514-1576), a surname adopted by GEORGE JOACHIM, German astronomer and mathematician.

Born at Feldkirch on Feb. 15, 1514, Rheticus studied at Tübingen with Oswald Mycone and afterward went to Wittenberg, where he was appointed professor of mathematics in 1537. Being greatly attracted by the new Copernican theory, he resigned the professorship in 1539 and went to Frauenberg to associate himself with Nicolaus Copernicus (q.v.); it was because of his enthusiasm that Copernicus completed the *De Revolutionibus*. Rheticus now began his great treatise, *Opus Palatinum de Triangulis*, published in 1596, and continued to work at it while he occupied his old chair at Wittenberg, and indeed up to his death at Cassovia in Hungary, on Dec. 4, 1576.

The *Opus Palatinum* of Rheticus was published by Valentine Otto, mathematician to the electoral prince Palatine, in 1596. It gives tables of sines and cosines, tangents, etc., for every ten seconds, calculated to ten places. He had projected a table of the same kind to 15 places, but did not live to complete it. The sine table, however, was afterward published on this scale under the name of *Thesaurus Mathematicus* (Frankfurt, 1613) by B. Friticus (1561-1613), who himself carried the calculations of a few of the earlier sines to 22 places. He also published *Narratio de Libris Revolutionum Copernici* (Gedernum, 1540), which was subsequently added to editions of Copernicus' works, and until 1551 *Epheemerides*, which were founded on the Copernican doctrines. He projected numerous other works, as was shown by a letter to

Petrus Ramus in 1568, which Adrian Romanus inserted in the preface to his *Idea of Mathematics*.

RHETORIC, the art of using language in such a way as to produce a desired impression upon the hearer or reader. Rhetoric as an art was taught in Greece by the Sophists (*q.v.*).

The power of eloquent speech is recognized in the earliest Greek writings, but the founder of rhetoric as an art was Corax of Syracuse. In 466 a democracy was established in Syracuse. One of the immediate consequences was a mass of litigation on claims to property, urged by democratic exiles who had been dispossessed by Thrasylbulus, Hieron or Gelon. Such claims, going many years back, would often require that a complicated series of details should be stated and arranged. The claimants also, in many instances, would lack documentary support, and rely chiefly on inferential reasoning. Hence the need of professional advice. The facts known as to the "art" of Corax perfectly agree with these conditions. He gave rules for arrangement, dividing the speech into five parts: poem, narrative, arguments (*ἀγῶνες*), subsidiary remarks (*παρεκβάσεις*) and peroration. Next he illustrated the topic of general probability (*εἰκός*), showing its two-edged use; e.g., if a puny man is accused of assaulting a stronger, he can say, "Is it likely that I should have attacked him?" If vice versa, the strong man can argue, "Is it likely that I should have committed an assault where the presumption was sure to be against me?" This topic of *εἰκός*, in its manifold forms, was in fact the great weapon of the earliest Greek rhetoric and it was further developed by Tisias, the pupil of Corax, as we see from Plato's *Phaedrus*. Its later developments were largely the work of Gorgias and Lysias and in a greater degree of Antiphon and Isocrates (see their separate biographies). But the detailed study of the art begins with Aristotle's *Rhetoric* (written 322-320 B.C.)

Aristotle's "Rhetoric."—Aristotle sets out from the proposition that rhetoric is properly an art, because when a speaker persuades, it is possible to find out why he succeeds in doing so. It is, in fact, the popular branch of logic. Hitherto, Aristotle says, writers on rhetoric have concerned themselves mainly with the exciting of emotions. All this is very well, but "it has nothing to do with the matter in hand; it has regard to the judge." The true aim should be to *prove* your point, or seem to prove it.

Aristotle does not sufficiently regard the question: What, as a matter of experience, is most persuasive? Logic may be more persuasive with the more select hearers of rhetoric; but rhetoric is for the many, and with the many appeals to passion will sometimes, perhaps usually, be more effective than syllogism. No formulation of rhetoric can correspond with fact which does not leave it absolutely to the genius of the speaker whether reasoning (or its phantom) is to be what Aristotle calls it, the "body of proof" (*σώμα πειρώσεως*) or whether the stress of persuading effort should not be rather addressed to the emotions of the hearers.

His statement, that the master of logic will be the master of rhetoric, is a truism if we concede the essential primacy of the logical element in rhetoric. Otherwise it is a paradox; and it is not in accord with experience, which teaches that speakers incapable of showing even the ghost of an argument have sometimes been the most completely successful in carrying great audiences along with them. Aristotle never assumes that the hearers of his rhetorician are as *οὐλοφάνεις*, the cultivated few; on the other hand, he is apt to assume tacitly—and here his individual bent comes out—that these hearers are not the great surging crowd, the *ἑσῶτες*, but a body of persons with a decided, though imperfectly developed, preference for sound logic.

What is the use of an art of rhetoric? It is fourfold, Aristotle replies. Rhetoric is useful, first of all, because truth and justice are naturally stronger than their opposites. When awards are not duly given, truth and justice must have been worsed by their own fault. This is worth correcting. Rhetoric is then (1) *corrective*. Next, it is (2) *instructional*, as a popular vehicle of persuasion for persons who could not be reached by the several methods of philosophy. Rhetoric is then (3) *practical*. Logic is concerned with two internal arts; that is to say, it is a matter of indifference to them, as arts, whether the conclusion which they draw in any given case is affirmative or negative. Suppose that I am going to

plead a cause, and have a sincere conviction that I am on the right side. The art of rhetoric will suggest to me what might be urged on the other side; and this will give me a stronger grasp of the whole situation. Lastly, rhetoric is (4) *defensive*. Mental effort is more distinctive of man than bodily effort; and "it would be absurd that, while incapacity for physical self-defence is a reproach," incapacity for mental defence should be no reproach. Rhetoric, then, is corrective, instructive, suggestive, defensive. But what if it be urged that this art may be abused? The objection, Aristotle answers, applies to all good things, except virtue, and especially to the most useful things. Men may abuse strength, health, wealth, generalship.

The Period from Alexander to Augustus.—Aristotle's method lived on in the Peripatetic school. Meanwhile the fashion of declamation increased, even among the philosophers. The Stoics were especially fond of it; and Cicero, who was a devotee of Greek literature, carried over the habit of declaiming to Rome. The Academy also continued its tradition of declamation. In the first century B.C., Roman historians like Livy and Sallust began to imitate the style of the Attic orators. In the first century A.D., Quintilian collected up the results of both in a new system—following the philosophers so far as to give the chief prominence to "invention." He thus became the founder of a rhetoric which may be distinguished as the scholastic. Through the influence of his school, Hermagoras did for Roman eloquence very much what Isocrates had done for Athens. Above all, he counteracted the view of Asianism, that oratory is a mere knack founded on practice, and recalled attention to the study of it as an art.

Cicero's rhetorical works are to some extent based on the technical system to which he had been introduced by Molon at Rhodes. But Cicero further made an independent use of the best among the earlier Greek writers, and he could draw, at least in the later of his treatises, on a vast fund of reflection and experience. The result is certainly to suggest how much less he owed to his studies than to his genius. Some consciousness of this is perhaps implied in the idea which pervades much of his writing on oratory, that the perfect orator is the perfect man. The same thought is present to Quintilian, in whose great work, *De Institutione Oratoria*, the scholastic rhetoric receives its most complete expression (C. A.D. 90). He treats oratory as the end to which the entire mental and moral development of the student is to be directed. Thus he devotes his first book to an early discipline to which he would precede the orator's first studies, and his last book to a discipline of the whole man which lies farthest from him. After Quintilian, the next important name is that of Hermagoras of Tarsus, who under Marcus Aurelius made a complete digest of the scholastic rhetoric from the time of Hermagoras of Temnos (110 A.D.) in five extant treatises, remarkable for clearness and acuteness.

Hermogenes continued for nearly a century and a half to be one of the chief authorities in the schools. Longinus (q.v.) (c. a.d. 260) published an *Art of Rhetoric* which is still extant; and the more celebrated treatise *On Sublimity* (περὶ ὑψους), if not his work, is at least of the same period. In the latter half of the 4th century Aphthonius (q.v.) composed the "exercises" (προπαρασκευαί) which superseded the work of Hermogenes. At the revival of letters the works of Aphthonius once more became a standard textbook. Much of the enjoyment of the rhetorical exercises of Aelius Theon (of uncertain date) (see further the editions of the *Rhetoricae Graecae* by L. Spenser) and by C. Walz.)

Rhetoric under the Empire. During the first few centuries of the empire the practice of the art was in greater vogue than ever before or since. First, there was a general dearth of the higher intellectual interests; politics gave no scope to energy, philosophy was stagnant and literature was, as a rule, either arid or frivolous. Then the Greek schools had poured their rhetoricians into Rome, where the same tastes which revelled in coarse luxury welcomed tawdry declamation. The law courts of the Roman provinces further created a continual demand for forensic speaking. The public teacher of rhetoric was called "sophist," which

was now an academic title, similar to "professor" or "doctor." In the 4th century A.C. Isocrates had taken pride in the name of *σοφιστής*, which, indeed, had at no time wholly lost the good, or neutral, sense which originally belonged to it.

Vespasian (A.D. 70-79), according to Suetonius, was the first emperor who gave a public endowment to the teaching of rhetoric. Under Hadrian and the Antonines (A.D. 117-180) the public chairs of rhetoric became objects of the highest ambition. The Rhetorical school (*ῥητορική*) had two chairs, one for sophistic, the other for political rhetoric. By "sophistic" was meant the academic teaching of rhetoric as an art, in distinction from its "political" application to the law courts. The sophistical chair was superior to the political in dignity as in emolument, and its occupant was invested with a jurisdiction over the youth of Athens similar to that of the vice-chancellor in a modern university. The Antonines further encouraged rhetoric by granting immunities to its teachers. Three sophists in each of the smaller towns, and five in the larger, were exempted from taxation (*Dig. xvii, 1, 6, §2*). The wealthier sophists affected much personal splendour. The aim of the sophist was to impress the multitude. His whole stock in trade was style, and this was directed to astonishing by tours de force. The scholastic declamations were chiefly of two classes. (1) The *suasoriae* were usually on historical or legendary subjects, in which some course of action was commended or censured (*cf. Juv. Sat.*). These *suasoriae* belonged to deliberative rhetoric (the *βουλευτικὸν ῥήτος, deliberativum genus*). (2) The *controversiae* turned especially on legal issues, and represented the forensic rhetoric (*δικαστικὸν ῥήτος, iudiciale genus*). But it was the general characteristic of this period that all subjects were treated alike in the style and spirit of that third branch which Aristotle distinguished, the rhetoric of *ἐπιδειξις* or "display." This academic oratory is shown under various aspects, and presumably at its best, by such writers as Dio Chrysostom at the end of the 1st century, Aelius Aristides (see ARISTIDES, AELIUS) in the 2nd (the chief rhetorician under the Antonines) and Themistius, Hierimius and Libanius in the 4th. Amid much which is tawdry or vapid, these writings occasionally present passages of true literary beauty, while they constantly offer matter of the highest interest to the student.

The Middle Ages and the Renaissance.—In the mediaeval system of academic studies, grammar, logic and rhetoric were the subjects of the trivium, or course followed during the four years of undergraduate study. Music, arithmetic, geometry and astronomy constituted the quadrivium, or course for the three years from the B.A. to the M.A. degree. These were the seven liberal arts. In the middle ages the chief authorities on rhetoric were the latest Latin epistomists, such as Martinius Capella (5th century), Cassiodorus (5th century) or Isidorus (7th century).

After the revival of learning the better Roman and Greek writers gradually returned into use. Some new treatises were also produced. Leonard Cox (d. 1549) wrote *The Art or Craft of Rhetorike*, partly compiled, partly original, which was reprinted in Latin at Cracow. *The Art of Rhetorique*, by Thomas Wilson (1553), afterward secretary of state, embodied rules chiefly from Aristotle, with help from Cicero and Quintilian. About the same time treatises on rhetoric were published in France by Tonquelin (1555) and Courcelles (1557). The general aim at this period was to revive the best teaching of the ancients. At Cambridge in 1570 the study of rhetoric was based on Quintilian, Hermogenes and the speeches of Cicero viewed as works of art. An Oxford statute of 1588 shows that the same books were used there. In 1620 George Herbert was delivering lectures on rhetoric at Cambridge, where he held the office of public orator. The decay of rhetoric as a formal study at the universities set in during the 18th century. The function of the rhetoric lecturer passed over into that of correcting written theses; but his title remained long after his office had lost its primary meaning. If the theory of rhetoric fell into neglect, the practice, however, was encouraged by the public exercises ("acts" and "opponencies") in the schools. The college prizes for declamations served the same purpose.

Modern Writers on Rhetoric.—The fortunes of rhetoric in the modern world, as briefly sketched above, may suffice to sug-

gest why few modern writers of ability have given their attention to the subject. One of the most notable modern contributions to the art is the collection of commonplaces framed (in Latin) by Bacon, "to be so many spools from which the threads can be drawn out as occasion serves," a truly curious work of that acute and fertile mind, and quite in the spirit of Aristotle's treatise. The popularity enjoyed by Hugh Blair's *Lectures on Rhetoric* in the latter part of the 18th and the earlier part of the 19th century was merited rather by the form than by the matter. Campbell's *Philosophy of Rhetoric*, which found less wide acceptance than its predecessor, was superior to it in depth, though often marred by an imperfect comprehension of logic. But undoubtedly the best modern book on the subject is Richard Whately's *Elements of Rhetoric*. Starting from Aristotle's view, that rhetoric is "an offshoot from logic," Whately treats it as the art of "argumentative composition." He considers it under four heads: (1) the address to the understanding (= Aristotle's *λογική πῆσις*); (2) the address to the will, or persuasion (= Aristotle's *ῥητική and παθητική πῆσις*); (3) style; (4) elocution, or delivery. But when it is thus urged that

All a rhetorician's rules

But teach him how to name his tools,

the assumption is tacitly made that an accurate nomenclature and classification of these tools must be devoid of practical use. The conditions of modern life, and especially the invention of printing, have to some extent diminished the importance which belonged in antiquity to the art of speaking, though modern democratic politics and forensic conditions still make it one which may be cultivated with advantage.

BIBLIOGRAPHY.—Among more modern works are J. Bascom, *Philosophy of Rhetoric* (1885), and numerous books on voice culture, gesture and elocution. For ancient rhetoric see Sir R. C. Jebb's translation of Aristotle's *Rhetoric*, ed. by J. E. Sandys (1909), and his *Attic Orators* (1876); also Spengel, *Atticum Scriptores* (1838); Westermann, *Gesch. der Beredsamkeit* (1833-35); Cope, in the *Cambridge Journal of Classical and Sacred Philology* (1855-57); introductions to Cicero's *De Oratore* (A. S. Wilkins) and *Orator* (J. E. Sandys); Volkmann, *Die Rhetorik der Griechen und Römer in system. Übersicht*, 2nd ed. (1884); Norden, *Die Antike Kunstprosa* (1898). (R. C. J.; X.)

RHEUMATIC FEVER is a generalized disease commonest in children between the ages of 5 and 15 but occurring with considerable frequency in young adults. The manifestations, severity, duration and after-effects are highly variable. In a small percentage of patients death may occur because of inflammation of the heart in the acute attack, but in a much larger number the acute attack subsides with a variable amount of cardiac damage. Recurrences of acute attacks are frequent.

Causative Factors.—The exact cause of rheumatic fever was still unknown at mid-20th century, although a close relationship to previous streptococcal infection had been well established. This is based on the high incidence of known streptococcal infection preceding attacks of acute rheumatic fever, the presence of streptococcal antibodies (particularly antistreptolysin) in the blood of patients with the disease, the association of increased incidence of rheumatic fever following streptococcal infections, and the prevention of recurrent attacks of rheumatic fever by the continued use of drugs which prevent streptococcal infection. It is generally believed that the disease results from the reaction of the body to the streptococcus rather than the direct effect of streptococcal infection, since bacteria cannot be regularly recovered from the body during the disease.

Many authorities believe that this illness represents a hypersensitivity reaction somewhat similar to the allergies. Rheumatic fever is not known to occur in any species but man, but pathologic lesions in the heart somewhat similar to those seen in rheumatic fever have been produced in rats and rabbits by repeated injection of foreign proteins.

Pathology.—Although clinical evidences of rheumatic fever may occur in the heart, joints, skin and central nervous system, the most characteristic pathological findings are seen in the heart. On gross examination the heart is usually dilated and the surface may be covered by a stringy material which adheres to the membrane covering the heart (the pericardium). The heart muscle is paler and softer than normal. Microscopic examination shows evidence

of a peculiar type of inflammation in the connective tissue. The most characteristic microscopic lesion is the Aschoff nodule, which consists of an accumulation of large pale cells together with smaller cells surrounding degenerating connective tissue fibres. Aschoff nodules are most characteristically found in the connective tissue of various parts of the heart, but similar lesions have been identified in the connective tissues of other organs.

In later stages of the disease the acute inflammation is replaced by scar formation. Such scarring results in deformity of the valves of the heart, bringing about interference with normal function. The mitral valve is most frequently involved, although the aortic valve is also commonly distorted. The tricuspid and pulmonary valves are rarely affected.

Public Health Aspects.—Rheumatic fever frequently occurs in more than one member of a family. This is usually attributed to hereditary susceptibility, although some authorities believe it is the result of common environmental conditions. There was as yet no conclusive evidence at mid-century to decide this question.

Rheumatic fever has been found in many parts of the world in representatives of all races. In the United States (as measured by mortality statistics) it is commoner in the northern half of the country, with the exception of low rates in the northern Pacific states. The highest rates occur in the middle Atlantic and mountain states. The observed rates cannot be correlated simply with latitude, average temperature, altitude or rainfall.

Rheumatic fever is not confined to any socio-economic group, but most studies have indicated a higher mortality in the poorer groups. Mortality rates are higher in the nonwhite than in the white population of the United States.

Rheumatic fever became one of the leading causes of death of children in the U.S. as death rates from infectious diseases declined with improved measures for prevention and treatment. It is difficult to estimate the true incidence because of difficulties in diagnosis and poor reporting. In the U.S. there was evidence of a decline in the death rate of children from rheumatic fever and rheumatic heart disease between 1920 and 1948. In 1948 it was estimated that 2,500 persons between the ages of 5 and 19 years died of acute rheumatic fever and rheumatic heart disease.

Because of the frequent long duration of rheumatic fever, few families are able to meet the financial burden; the disease thus became an important public health problem. In some large cities special hospitals are maintained for the care of children with rheumatic fever and rheumatic heart disease.

One of the earliest community attempts to meet the problem was the development of the London County Council's Rheumatism scheme, which provided for both hospital care and a follow-up program for all children with rheumatic fever. The private financial difficulties of the care of rheumatic fever in Great Britain were overcome by the National Health Insurance scheme.

In the United States special programs for the care of children with rheumatic fever were developed after 1939 under the Social Security act. These programs were operated on a state basis with funds provided jointly by the states and the children's bureau of the Federal Security agency. By 1957, 23 states, Alaska, the District of Columbia and Hawaii had such programs. The nature of the services and the manner in which they were administered varied from state to state. The American Council on Rheumatic Fever, organized in 1944 under the leadership of the American Heart association, was instrumental in promoting public and private programs for care, research and education in the disease. Under the National Heart act of 1948 the National Heart Institute of the United States public health service began to conduct research on heart disease including rheumatic fever. Through a program of grants-in-aid the Heart Institute also supported research, training, demonstration programs and community programs for the control of rheumatic fever.

Clinical Characteristics.—The clinical recognition of rheumatic fever is made difficult by the wide variety of symptoms. The most important evidences are those which result from inflammation of the heart, and, of these, the commonest are certain types of murmurs and increased heart-beat rate. It is frequently difficult to determine whether a given murmur is the result of the

presence of active rheumatic fever or of a previous attack. With more serious heart involvement there may be rapid enlargement of the heart, heart failure resulting in difficulty in breathing, evidence of inflammation of the membranes overlying the heart (pericarditis) and irregularities of the heart beat. Additional evidence of cardiac involvement is sometimes obtained on electrocardiographic tracings. The extent and duration of cardiac inflammation is extremely variable in all age groups, but in general tends to be more severe in younger children than in young adults. Severe cardiac involvement may result in death in a relatively short time.

Involvement of the joints is a common manifestation. This may vary from mild aches and pains to severe swelling, redness, tenderness and limitation of motion. Characteristically several joints are involved, with migration from day to day. Although there may be only mild aches and pains in the joints, these symptoms may occur in so many other diseases that they are insufficient in themselves to establish a diagnosis. The joint symptoms are commoner in patients in the older age groups than in young children. Joint manifestations are commonest in the early stages and never result in permanent impairment of function.

Numerous small nodules may occur in the skin, but rarely before the third or fourth week of disease. A variety of skin rashes may be present in acute rheumatic fever, the most characteristic of which is erythema marginatum, which is considered highly specific for the disease by most authorities.

Chorea (St. Vitus' dance) represents a nervous system manifestation of rheumatic fever. It is characterized by purposeless movements of the arms and legs and inability to perform co-ordinated movements of muscle groups. Marked emotional disturbances may also be present. The severity and duration of these symptoms are highly variable.

Fever occurs in a relatively large percentage of patients with rheumatic fever, but is not necessarily present. A wide variety of other signs and symptoms may also be present. Among these are nosebleeds, weakness, abdominal pain, chest pain and weight loss. Examination of the blood usually shows an increase in the rate of sedimentation of red blood cells, and frequently shows an anaemia and an increased number of white blood cells.

In typical cases a combination of the above symptoms makes diagnosis relatively certain. Many patients have the disease in a more subtle form, so that the first recognition of the previous rheumatic episode comes from the presence of structural abnormalities of the heart characteristically produced by rheumatic fever.

The length of an individual attack of acute rheumatic fever is highly variable and is sometimes difficult to ascertain. In certain persons symptoms may be transient, while in others the disease remains obviously active for periods of more than a year.

The degree of cardiac damage sustained during an individual attack is not related simply to the severity of the acute attack, but may be more closely related to the total duration of active disease. The interference with normal heart function, usually referred to as rheumatic heart disease, results in the main from distortion of the valve structure. Although such distortion may lead to extreme cardiac disability, patients with rheumatic heart disease may carry on relatively normal lives. The greatest threat to life is reactivation of the rheumatic process. A large percentage of people have no interference with cardiac function following recovery from acute rheumatic fever.

Treatment.—Until 1949 the usual treatment of rheumatic fever consisted of the use of salicylate drugs. There remained some difference of opinion as to whether these drugs have any specific effect on the rheumatic process. In 1949 it was shown that adrenocorticotrophic hormone and cortisone have striking effects on rheumatic fever including cardiac involvement. It was still not clear, however, whether use of these drugs prevents subsequent development of heart disease and has an advantage over salicylate treatment.

Patients with active rheumatic fever are usually kept at bed rest for the duration of their active disease. In patients with severe cardiac failure digitalis, mercurial diuretics, restriction of salt

intake, and oxygen are valuable. Adequate nutrition and good nursing care are important. In view of the relationship to streptococcal infection, prevention of infection by this microorganism is important.

The use of small doses of sulfadiazine and penicillin prophylactically has resulted in the reduction of the rate of recurrences in patients with previous attacks.

(A. Doe.)

RHEUMATISM, a general descriptive term meaning discomfort, pain and stiffness in or around muscles and joints. It may be the result of injury, such as strain, or of the inflammatory or degenerative processes affecting the joints or ligaments, the muscles or nerves. More specifically it may refer to rheumatic fever, forms of arthritis and a variety of conditions designated by a descriptive adjective such as articular rheumatism, muscular rheumatism, etc.

(See JOINTS AND LIGAMENTS; RHEUMATIC FEVER; RHEUMATOID ARTHRITIS.) (F. L. A.)

RHEUMATOID ARTHRITIS. Rheumatoid arthritis is a chronic disease, the course of which is generally progressive. Its outstanding manifestations are destructive and deforming inflammation of multiple articulations. In addition, many other organs and systems are affected, notably the musculature, subcutaneous tissues, peripheral nerves, blood and lymphatic structures. Frequently patients with rheumatoid arthritis experience episodes of ophthalmitis, chronic progressive inflammatory carditis, and show multiple subcutaneous nodules. Pronounced vasomotor disturbances are commonly present, evidenced by excessive sweating of hands and feet, with cyanosis of the extremities, or by dilatation of capillaries about the palms and fingertips. Certain serologic, biochemical and haematologic abnormalities are characteristically present. Synonyms for rheumatoid arthritis include atrophic arthritis, chronic infectious arthritis, chronic polyarthritis and arthritis deformans. Rheumatoid arthritis occurs at all ages, being encountered in children, adults and in the aged. The onset occurs most frequently, however, between the ages of 20 and 40. The cause was still unknown at mid-20th century. Search for the responsible agent had at times centred upon investigations of bacteria, metabolic disorders, allergies and inherited abnormalities. Later, attention was directed to the possibility of a hormonal aetiology by the discovery that the adrenocorticotrophic hormone, cortisone, 17-hydroxy, 11-dehydrocorticosterone (Compound E of Kendall) and the pituitary adrenocorticotrophic hormone are capable of relieving symptoms of this disease. This discovery had not disclosed the ultimate mechanism of rheumatoid arthritis, however.

The total incidence of rheumatoid arthritis was not definitely known. Results of a broad survey concerning incidence of chronic diseases in the United States indicated that more than 6,850,000 persons in the United States were suffering with "rheumatism"; of these, 3,000,000 had chronic rheumatism and 1,250,000 were said to be disabled thereby. It was believed that a majority of those disabled had rheumatoid arthritis, and it was estimated, therefore, that in the United States alone there were between 1,000,000 and 2,000,000 sufferers with this disease at mid-century. Rheumatoid arthritis was by far the most important form of joint diseases, causing great economic waste and many serious sociologic problems.

During the first three decades of the 20th century the dominant theory as to cause of rheumatoid arthritis was the infectious theory. Search for a germ, however, generally proved fruitless. Bacterial cultures made from joints usually were sterile, and cultures of the blood and other tissues likewise failed to disclose responsible organisms.

The bacterial theory of causation of rheumatoid arthritis lost favour also when it became evident that removal of so-called infected foci, such as tonsils and teeth, rarely resulted in cures. Studies of serologic reactions of blood did not produce direct evidence to support the infectious theory.

Abnormal serologic reactions which had been detected were widely considered nonspecific in character. No responsible virus had been identified.

During the next two decades, extensive studies conducted to

determine whether a vitamin deficiency was related to the cause of rheumatoid arthritis did not succeed in establishing such a relationship.

At mid-20th century information was acquired which indicated that symptoms of rheumatoid arthritis could be relieved or improved by administering a hormone of the pituitary gland or certain hormones of the cortex of the adrenal gland. This suggested that rheumatoid arthritis might be caused by a biochemical or metabolic disturbance, but such a disturbance if it existed had not yet been detected.

Physicians commonly refer to rheumatoid arthritis as a collagen disease. This suggests that rheumatoid arthritis results from a disturbance of the albuminoid material in white fibres of connective tissue, cartilage and bone. This concept, however, was still a hypothetical one at mid-century.

Two major types of rheumatoid arthritis are encountered. They are not always distinct in their manifestations, and in some cases the disease appears as a mixture of both, with clinical features of one or the other predominating. The first type which affects mainly joints of the extremities has been designated the peripheral type. The second, manifested primarily as an inflammatory disease of the spine, has variously been designated rheumatoid spondylitis, Strümpell-Marie disease, Bechterew's disease, adolescent spondylitis and spondylitis deformans. The peripheral form of rheumatoid arthritis occurs predominantly among females, the incidence being two or three times greater than in males. The spinal variety occurs most commonly in males, the incidence being 10 to 20 times as great as among females.

Characteristically the onset of both types is insidious, although symptoms may begin precipitately, with high fever and severe constitutional symptoms. Generally patients observe stiffness and swelling in several joints and complain of fatigue, loss of weight and pain on motion. Joints become visibly swollen and tender and sometimes show a bluish discoloration. In some instances a few scattered joints are involved at the beginning; more typically, multiple joints are attacked in a symmetrical pattern; for example, fingers of both hands, wrists, metatarsophalangeal joints of both feet, elbows, knees, etc. The clinical course is usually marked by periods of rapid progression and severe symptoms alternating with periods of quiescence and relatively good health. Sometimes patients experience complete remissions from symptoms and may remain in a state of good health for months or years. Recurrences and exacerbations may occur later. In some instances the disease progresses relentlessly to an advanced stage in which the patient presents a picture of great crippling and deformity, inanition, wasting of muscles and various atrophic skin disorders. Some patients may experience febrile periods lasting for weeks or months.

Certain biological data characteristic of rheumatoid arthritis may aid in establishing the diagnosis and provide objective evidence of the severity of the disease. Erythrocyte counts and haemoglobin determinations show moderate secondary anaemia in milder cases and more intense anaemia in severe instances. The rate of sedimentation of erythrocytes through heparinized or oxalated plasma is moderately rapid in mild cases and relatively more rapid in severe cases. Severe cases also show relative increases in level of serum globulins in relation to albumin fractions, thus causing reduction or actual inversion of the albumin-globulin ratio.

In mild cases leucocyte counts are within normal limits, but acute cases may show leucocytosis ranging between 10,000 and 20,000. In cases of long duration, especially where patients are approaching a state of exhaustion, leucocyte counts may be low, ranging between 2,000 and 5,000 per cubic millimetre. In some cases the serum may show elevated titres of agglutinating antibodies against the haemolytic streptococcus. The latter test, however, is considered to be a nonspecific reaction and does not necessarily prove an aetiological relationship to the streptococcus.

In earlier stages of rheumatoid arthritis roentgenograms may disclose only swelling of soft tissues about joints and atrophy of subarticular epiphyseal bone. As the disease progresses and as inflammatory destruction advances, roentgenograms disclose additional abnormalities, narrowing of articular spaces, erosion and

atrophy of articular cartilages and finally destruction of epiphyseal bone, together with various subluxations and deformities.

Special forms of chronic arthritis regarded by most rheumatologists as aberrant forms of rheumatoid arthritis include Still's disease, intermittent hydroarthrosis and Fely's syndrome. Still's disease (juvenile rheumatoid arthritis) affects children. In this condition, articular symptoms are associated with anaemia, enlargement of the spleen, lymph nodes and liver. Intermittent hydroarthrosis is manifested by regularly recurring episodes of painful swelling, affecting mainly the knees and rarely the ankles or other joints. Attacks last three to five days, usually subside completely for varying brief periods of a week or so and recur with clockwork regularity at given intervals. In later years such patients may show progressive involvement of joints as in the commoner variety described above. The term "Fely's syndrome" has been applied to a condition of chronic progressive polyarthritis occurring in adults, associated with enlargement of the spleen and lymph nodes and usually associated with characteristic leucopenia. In other respects, the course of Fely's syndrome is the same as that of classic rheumatoid arthritis.

Pathologists have described distinctive inflammatory reactions in tissues from patients with rheumatoid arthritis. These lesions are highly characteristic of the disease. Synovial membranes show hypertrophy of all elements, proliferation and reduplication of lining endothelial layers and thickening of the subendothelial fibrous tissues. Tiny villus projections normally present on the lining membranes become greatly enlarged and may give to the interior of the joint a shaggy appearance. Blood vessels within these villi and throughout the lining and capsular tissues show evidence of active proliferation and usually are dilated and filled with blood. Lymphocytes and other inflammatory cells accumulate throughout the lining membrane and in some regions lymphocytes collect to form dense follicles similar to the follicles of lymphocytes found normally in spleen and lymph nodes. Small scattered regions of inflammation, somewhat similar to those in synovial membranes, have been found in muscles and nerves. Subcutaneous nodules found in some cases also show a distinctive pathologic picture: central necrotic zones, surrounded by inflammatory cells of the reticulo-endothelial system. The latter cells, elongated and sometimes multinucleated, are arranged side by side, with long axes, perpendicularly to the necrotic zones. This arrangement has been designated palisading. Beyond this layer of palisaded cells appears a zone of inflammatory cellular reaction in a stroma of varying density.

Patients who have rheumatoid arthritis occasionally present signs and symptoms indicating involvement of the heart muscle or valves. Studies made at necropsy revealed that in at least 40% of the cases gross or microscopic lesions are present. These are indistinguishable from the cardiac lesions previously considered specific for rheumatic fever.

No rapidly acting or specific therapeutic agent had been discovered for rheumatoid arthritis by mid-20th century. However, certain remedies are helpful in relieving symptoms, preventing deformity and perhaps in some cases in shortening the course of the disease. Physicians widely experienced in the care of patients with this disease consider it advisable to remove infected foci, with a view to improving the general health. Regular periods of rest are considered desirable to oppose the symptom of fatigue which is prominent in most cases. For those patients who lose weight and strength, the diet should be generally high in calories. In the presence of obesity, however, weight reduction diets are indicated. Valuable physical measures of treatment include applications of dry or moist heat, contrasting hot and cold applications for the extremities, massages and carefully prescribed exercise. Injections of gold salts are widely used and approved. Distinct improvement and in some cases complete remissions have resulted from such injections. Toxic reactions to gold may occur as with any heavy metal therapy. Usually these reactions are not serious, but occasionally severe and even fatal toxicity has been reported. Severe reactions are usually well controlled by means of Bal (British antilewisite; 2,3--dimercaptopropanol). A dry climate may give temporary relief from symptoms of rheumatoid arthritis,

but results of climate therapy are often disappointing. No one climate has been consistently helpful. Chemotherapeutic and antibiotic agents (sulfonamides, penicillin, streptomycin, aureomycin, chlormycetin, etc.) are valueless against rheumatoid arthritis.

Many remedies formerly in favour were later considered to have little or no value: vaccines, concentrated preparations of vitamins, bee or cobra venom, sulphur compounds, etc.

To improve function in crippled joints, certain nonsurgical and surgical orthopaedic procedures are available: braces, supportive corsets and various plastic operations on joints are used in special cases.

Therapy of rheumatoid arthritis with cortisone (Compound E of Kendall) and with the pituitary adrenocorticotrophic hormone was being widely used at mid-20th century. Therapy with hydrocortisone (Compound F of Kendall) was also being tested. An estimate of the ultimate value of these procedures could not be made, however, because of the brief period of observation. Patients adequately treated with cortisone and pituitary adrenocorticotrophic hormone show notable reduction of inflammatory swellings, increased muscle strength, improvement of anaemia and varying degrees of improvement of abnormal sedimentation rates. Undesirable side effects reported frequently include rounding of facial contours, water retention, growth of hair on the face, and psychoses. The beneficial effects appeared to outweigh in importance the gravity of side effects, however, and many rheumatologists therefore considered further therapeutic application and experimentation with these hormones to be justified.

RHEYDT, a town in Nordrheinland-Westfalen, Germany, situated on the Niers, 19 mi. W. of Düsseldorf, on the main line of railway to Aachen, and at the junction of lines to Crefeld and Stolberg. Pop. (1939) 76,283. Rheydt is an ancient place, but its industrial importance is of recent growth, and it only received municipal rights in 1856.

The principal products of Rheydt's numerous factories are silk, cotton, woollen and mixed fabrics, velvet, iron goods, machinery, shoes, cables, soap and cigars. It was frequently bombed in World War II.

RHIANUS, Greek poet and grammarian, a native of Crete, friend and contemporary of Eratosthenes (275-195 B.C.). Suidas says he was at first a slave and overseer of a palaestra but obtained a good education later in life and devoted himself to grammatical studies, probably in Alexandria. Of his works none has been preserved except 11 epigrams. But he was chiefly known as a writer of epics, the most celebrated of which was the *Messeniac* in six books, dealing with the second Messenian war and the exploits of Aristomenes.

Other similar poems were the *Achaica*, *Eliaca*, *Thessalica* and *Heracleia*.

Fragments in A. Meineke, *Analecta Alexandrina* (1843); for Rhianus' work in connection with Homer, see C. Mayhoff, *De Rhiani Suidis Homeris* (Dresden, 1870); also W. Christ, *Geschichte der griechischen Literatur* (1898).

RHIGAS, CONSTANTINE, known as Rhigas of Velestinos (Phreias), or Rhigas Pheraios (1760-1798), Greek patriot and poet, was born at Velestinos, and was educated at Zagora and at Constantinople, where he became secretary to Alexander Ypsilanti. In 1786 he entered the service of Nicholas Mavrogenes, hospodar of Wallachia, at Bucharest, and when war broke out between Turkey and Russia in 1787 he was inspector of the troops at Craiova. Rhigas then became interpreter at the French consulate at Bucharest, where he wrote the famous Greek version of the *Marseillaise*, well known in Byron's paraphrase as "sons of the Greeks, arise." He founded the patriotic society called the Hetairia. He went to Vienna to organize a revolutionary movement among the exiled Greeks and their foreign supporters in 1793, or possibly earlier. There he founded a Greek press, but his chief glory was the collection of national songs (posthumously printed 1814) which, passed from hand to hand in M.S., roused patriotic enthusiasm throughout Greece. While at Vienna Rhigas entered into communication with Bonaparte, to whom he sent a snuffbox made of the root of a laurel tree taken from the temple of Apollo, and he set out to meet him at Venice. But before leaving Vienna he forwarded papers, amongst which is said to have been his correspondence with Bonaparte, to a compatriot at Istria. These fell into the hands of the Austrian government, and Rhigas was arrested at Trieste and handed over with his accomplices to the Turkish authorities at Belgrade. His five companions were secretly drowned, and Rhigas was shot.

RHINE, one of the most important rivers in Europe. It is about 700 mi. in length. It rises in Switzerland, later forms the boundary between Switzerland and Austria, then flows through Germany and finally through Holland to enter the North sea.

Switzerland.—In the Swiss portion two mountain rivers, the *Rhinter Rhein* and the *Vorder Rhein*, unite at Reichenau, 6 mi. southwest of Coire, to form the main stream. The principal stream, the *Rhinter Rhein*, issues (7,271 ft.) from the glaciers of the Rheinwaldhorn (Adula group) west of Spilügen and flows eastward through the Rheinwald towards Reichenau. The *Vorder Rhein* rises in Toma lake (7,691 ft.) near the Oberalp pass and is joined by a number of consequent (right) and obsequent (left) streams as it flows eastward past Disentis and Illanz to Reichenau. The valley of the combined river now becomes wider and is alluvium-filled. The consequent northward direction is again followed below Coire (Chur) as far as Lake Constance.

Below Buchs the valley becomes wider, the river meanders about, "is corrected" in many places, shortened by a canal at Diepoldsau and finally enters Lake Constance (g.v.) across a marshy delta. Between Sargans and the lake it forms the boundary between Switzerland and Liechtenstein and Austria. On leaving the lake at Constance the Rhine flows westward as far as Basle. It drops 400 ft. along this stretch, the first part of which is across the Tertiary and Jurassic rocks of eastern Switzerland.

Germany.—At Basle the Rhine turns sharply northward and assumes an entirely new complexion. Its course lies through the famous rift valley of the Rhine between the Vosges and the Black forest massifs and was initiated in Lower Oligocene times. It meanders as a wide stream with low banks and contains many islands. The river, which in the interests of navigation has been frequently "corrected," lies in a flat valley 20 mi. wide which ends abruptly against the massifs on both sides. Also flowing in the valley is the tributary (left), the Ill, which rises near Basle and flows parallel to the Rhine for over 50 mi. to join it below Strasbourg.

The Rhine forms the boundary between France and Germany from Basle to Lauterbourg, opposite Karlsruhe, beyond which the river, flowing through Germany, passes Mannheim, where it is joined by the Neckar (right), Worms and Mainz, where it is joined by the Main (right). Here its course is blocked

by the Armorian range of the Taunus and so the river turns sharply westward through a steep-sided gorge to Bingen where it is joined by the Nahe (left). After Bingen it again resumes a northerly course but its valley is still a narrow cut through contorted Devonian slates and greywackes. It is joined by the Lahn (right) and then at Coblenz by the Moselle (left) which rises in the Vosges and drains, with its tributary the Saar, the region between the Vosges and the Ardennes. At Coblenz the valley becomes wider only to narrow again as the river passes on to Bonn, between the Eifel and the Westerwald uplands.

At Bonn the river leaves the Armorian ranges and passes through the great industrial region of western Germany, is very sluggish and meanders over an almost level plain.

Holland.—In Holland its course is again westward. Almost immediately after entering this country the river divides into two arms, the larger of which, carrying off about two-thirds of the water, diverges to the west and is called the Waal, whilst the smaller, which is still called the Rhine, sends off another arm, the IJssel, to the Zuider Zee. The Waal is joined on the left by the Maas (Meuse) and after passing Nijmegen and Dordrecht enters the North sea by way of the Hollandsh Diep.

Navigation.—The Rhine has been one of the chief waterways of Europe from the earliest times; and its channel has been comparatively easy to keep open. The position of the river is highly favourable for the development of its trade. It flows through regions rich in mineral resources and the most populous of Europe, to discharge into one of the most frequented seas opposite Great Britain. Besides serving as a natural outlet for Germany, Belgium and Holland, it is connected with a great part of central and southern France by the Rhine-Rhone and the Rhine-Marne and other canals, and with the basin of the Danube by the Ludwigskanal.

The introduction of steam has greatly increased the shipping on the Rhine, and small steamers ply also on the Main, Neckar, Maas and Moselle. The steamboat traffic has especially encouraged the influx of tourists. Large passenger boats ply regularly between Mainz and Düsseldorf, and sometimes extend their journey as high up as Mannheim, and as far in the other direction as Rotterdam. The river is navigable without interruption from Basle to its mouth, a distance of 550 mi. Above Spire, however, the river craft are comparatively small. The efforts of the river authorities are being directed to the deepening and improvement of the navigable channel from the sea to Strasbourg. Two navigable channels of sufficient depth for all vessels which ply up and down that part of the stream have been blasted out where rapids occur near Bingen.

At the chief river-mouth ports, Rotterdam, Antwerp and Amsterdam, merchandise is transferred from ocean steamers to river steamers or *vice versa*. Nearly three-fourths of the Rhine traffic passes through Rotterdam, which is the only one of these ports directly on the Rhine. Amsterdam is connected by the *Merwede* canal and the difficulties of navigation in the canal have considerably reduced this port's share of the traffic. The passage to Antwerp is indirect and plans were going forward to connect the Belgian city directly with the Rhine by extending the Scheldt. Meuse canal to Ruhrort. Duisburg, Ruhrort and Cologne are the principal export ports in the central reaches of the river. They have expanded rapidly with the exploitation of the coal mines and the building up of the great industrial region of the Ruhr valley. Capacious harbours have been formed in the low-lying basins of the valley, and river facilities are supplemented by the Herne canal which traverses the heart of the Ruhr section and continued as the Ems canal connects with the intricate inland waterway system of central and northern Germany. The chief ports of the Upper Rhine—Mannheim, Rheinau, Ludwigshafen and Strasbourg—are places of transfer from river to railway. They deliver and collect from the southern markets of Germany and Switzerland. From Mainz there is passage via the Main river and the Ludwig canal, which it is expected to improve or supplement, to the Danube river.

Four-fifths of the Rhine traffic is made up of fuels, ores and cereals, all heavy commodities. Trade in them thrives best when

they may be shipped by water routes. Coal constitutes the principal cargo. Originating in the Ruhr district it supplies Holland and Belgium at the mouth of the river, reaches Switzerland and even Italy to the South and supplies the extensive industrial and domestic demands of the territory in between. Its presence has given value to the ores which form the second most important cargo and the two in combination have given rise to the extensive metallurgical industries of the Rhine region which have built up the Rhine cities and increased the density of population. In the demands of the latter originates the cereal cargo, made necessary since the Rhine raises little of its foodstuffs. The cereals come principally from Russia, Rumania, the United States and Argentina, being trans-shipped from the river-mouth ports. London, Hamburg, Bremen and the chief Baltic ports also participate in the Rhine traffic. These extensive ramifications have made the control of Rhine navigation an international problem rather than one affecting only Rhine states.

The commerce carried on by the river itself is supplemented by the numerous railways which skirt its banks and converge to its principal towns. Before the introduction of railways, there were no permanent bridges across the Rhine below Basel; but now trains cross it at a dozen different points in Germany and Holland.

The Rhine has always exercised a fascination over the German mind. "Father Rhine" is the centre of the German's patriotism and the symbol of his country. In his literature it has played a prominent part from the *Nibelungenlied* to the present day; and its romantic legends have been alternately the awe and delight of his childhood. The Rhine was the classic river of the middle ages. But of late years the beauties of the Rhine have become sadly marred; the banks in places disfigured by quarrying, the air made dense with the smoke of cement factories and steam-tugs, commanding spots falling a prey to the speculative builder and villages growing up into towns.

For the demilitarization of the Rhine under the Versailles Treaty see RHINELAND, THE, below.

Haelling, *Le Rhin: politique, économique, commercial* (1921); E. de Martonne, *Conditions physiques et économiques de la navigation rhénane* (1921); A. Antoine, *L'aménagement du Rhin de Bâle à Strasbourg* (1921).

RHINELAND, THE. Before Prussia's dissolution the word "Rhineland" was used to designate the Prussian province of *Rhein-provinz* as well as parts of the Prussian province of Hesse-Nassau, parts of Hesse, the Bavarian Palatinate and most of Baden.

The old Rhenish territory north of Lorraine had been annexed by France in 1801, but after the fall of Napoleon the Congress of Vienna transferred it to Prussia and Bavaria. In 1866 Napoleon III vainly tried to recover the Rhineland by diplomatic bargaining with Bismarck. After the defeat of Germany in 1918, French policy aimed at detaching the left bank of the Rhine from Germany, with the object of protecting itself against a new German attack; but since the region is German in nationality and tradition this was opposed by Great Britain and the United States, and France had to accept a compromise: (1) the left bank remained German; (2) it was to be occupied, together with the bridgeheads, by Allied troops in three zones, the northern zone (Cologne) to be evacuated after 5 years, the middle (Coblenz) after 10, the southern (Mainz) after 15 years, if Germany faithfully carried out the conditions of the peace (Art. 42-29 of the Treaty of Versailles); (3) the left bank of the Rhine and a strip of 50 km. on the right bank was to be completely and permanently demilitarized (Art. 42-44). The occupation was intended to provide both guarantees for the execution of the treaty and security to France against military aggression.

By a separate Rhineland agreement an interallied commission was established, composed of representatives of Belgium, France, Great Britain and the United States, with the right to issue ordinances for the security of the Allied forces. It was not to interfere with the German civil administration, but to erect a customs barrier in order to safeguard the economic interests of the population (Art. 276). Considerable friction developed be-

tween the commission, presided over by Paul Tirard, a Frenchman, and the Germans, particularly over the use of Negro soldiers by the French as part of their occupying troops. The charges of had conduct against the Negro troops were, however, greatly exaggerated, according to the testimony of the general commanding the American troops. The British and the Americans favoured a lenient policy of occupation, whereas the French and the Belgians were inclined to severity. After the United States failed to ratify the Treaty of Versailles and made a separate peace with Germany (1921), the American troops were withdrawn from Coblenz, and that area was taken over by the French.

France accepted the compromise about the Rhineland because both Great Britain and the United States, simultaneously with the Treaty of Versailles, signed treaties of alliance with France, by which they bound themselves to come to the aid of France "in the event of any unprovoked movement of aggression against her being made by Germany." When these treaties were not ratified by the British and U.S. governments, France felt that she had been victimized, that she had lost the real fruits of victory; subsequent events were to prove the correctness of this view.

As soon as it became clear that the left bank of the Rhine would not be separated from Germany, the French military authorities began to foster separatist movements in the region. An old-established anti-Prussian prejudice of the Catholic population of the Rhine province had been intensified by a fear of the spread of bolshevism, and a genuine movement for decentralization arose, which demanded the creation of a Rhineland state within the German republic. The head of this movement, Dr. Hans Dorten, entered into negotiations with General Charles-Marie Mangin, which killed the movement so far as the Germans were concerned, and since the American authorities would not co-operate, the plan collapsed. Dorten was subsequently abducted and arrested by the Germans, but was released at the demand of the French high commissioner.

The occupation of the Ruhr (*g.u.*) in 1923 by France and Belgium, which extended to Karlsruhe and to the districts between the bridgeheads on the right bank of the Rhine, gave new life to the separatist movement, for the British were in a minority on the Rhineland commission and the French authorities were free to assist the separatists. The first manifestation was a rising in Düsseldorf on Sept. 30, which was easily suppressed by the local authorities. Then came the proclamation on Oct. 21 of a "Rhineland republic" at Aachen (Aix-la-Chapelle), in the Belgian zone; this lasted until Nov. 2, when the Belgian government, under British pressure, disavowed the enterprise. Simultaneously, Dorten and one Matthes organised a *Putsch* at Bonn, Coblenz, Wiesbaden and Mainz, their followers being transported by the Franco-Belgian railway administration. When the two leaders quarrelled, their regime collapsed, early in 1924.

More serious was the movement in the Bavarian Palatinate, where it was fanned by General de Metz. On Oct. 25, he declared that the Palatinate had ceased to be part of Bavaria, and the separatists seized the government and ejected about 10,000 German officials. The population retaliated and there was a kind of civil war, in which the separatists fared badly, 15 of them being massacred at Pirmasens. The Rhineland commission proposed to recognize the new state, but under British pressure the French government withdrew its support, and the German officials returned in Feb. 1924. This French policy of encouraging separatism destroyed any sentiment among the Germans in favour of Rhenish autonomy.

In 1924, as a result of the elections which transferred control of parliament from the right to the left, the new French government, under Edouard Herriot, agreed to the Dawes plan (see REPARATIONS) for the settlement of the reparation question and to the evacuation of the Ruhr. Germany thereupon looked forward to the evacuation of the northern zone of the Rhineland on Jan. 10, 1925. The Allied governments, however, were convinced that Germany had not carried out her obligations to disarm and postponed the evacuation until the terms of the treaty had been complied with. In order to facilitate the negotiations for evacuation and to prevent another occupation of

RHINELANDER, a city of northern Wisconsin, U.S.A., on the Wisconsin river, 254 mi. N.N.W. of Milwaukee; the county seat of Oneida county. It is on federal highway 8; has a municipal airport; and is served by the Chicago and North Western and the Soo Line railways. Pop. 8,728 in 1950 and 8,501 in 1940. It is in the midst of the great north pine woods, and there are 232 lakes within a radius of 12 mi. The city has manufacturing industries: paper mills, veneer works, novelty works, plastic products, yeast plant, structural bricks and blocks, burial vaults, boat factory, brewery, bottling plants, flooring factory, bakeries, creameries. Rhinelander was settled in 1882 and chartered as a city in 1894.

RHINE PROVINCE or **RHINELAND**, the most westerly province of Prussia. The small district of Wetzlar in the midst of the province of Hesse-Nassau also belongs to the Rhine province, which, on the other hand, surrounds the Oldenburg province of Birkenfeld. The Rhine province is 9,995 sq.mi.

The southern and larger part of the Rhine province, belonging geologically to the Devonian formations of the lower Rhine, is hilly. On the left bank are the elevated plateaus of the Hunsrück and the Eifel, separated from each other by the deep valley of the Mosel, while on the right bank are the spurs of the Westerwald and the Sauerland, the former reaching the river in the picturesque group known as the Seven Mountains (*Siebengebirge*). The highest hill in the province is the Walderbeskopf (2,670 ft.) in the Hochwald, and there are several other summits above 2,000 ft. on the left bank, while on the right there are few which attain a height of 1,600 ft. Most of the hills are covered with trees, but the Eifel (*q.v.*) is a barren and bleak plateau. To the north of a line drawn from Aix-la-Chapelle to Bonn the province is flat, and marshy districts occur near the Dutch frontier. The climate varies considerably with the configuration of the surface. That of the northern lowlands and of the sheltered valleys is the mildest and most equable in Prussia, with a mean annual temperature of 50°, while on the hills of the Eifel the mean does not exceed 44°. The annual rainfall varies in the different districts from 18 to 32 inches. Almost the whole province belongs to the basin of the Rhine, but a small district in the northwest is drained by affluents of the Meuse. Of the numerous tributaries which join the Rhine within the province, the most important are the Nahe, the Mosel and the Ahr on the left bank, and the Sieg, the Wupper, the Ruhr and the Lippe on the right. The only lake of any size is the Laacher See, the largest of the extinct crater lakes of the Eifel.

Little except oats and potatoes can be raised on the high-lying plateaus in the south of the province, but on the lower ground cereal crops and fruit are grown, and tobacco, hops, flax, rape, hemp and beetroot (for sugar) are cultivated for commercial purposes. Vine-culture occupies about 30,000 acres, about half of which are in the valley of the Mosel, a third in that of the Rhine itself, and the rest mainly on the Nahe and the Ahr. The choicest varieties of Rhine wine, however, such as Johannisberger and Steinberger, are produced higher up the river, beyond the limits of the Rhine province. In the hilly districts there is much of the soil is generally covered by forests, and the cultivation of oak is confined to the valley of the Ahr. Considerable herds of deer are reared on the high plateaus of the lower Rhine, but the number of sheep is small. The wood-lands are well stocked with deer, and a stony well-wooded hill rises away from the coast of the Wadden Sea to the north of the Hunsrück. The slope on either side of the Rhine is very productive and well wooded in the mountain districts.

The Rhine province is very rich in mineral resources. It contains important deposits of coal near Aix-la-Chapelle. Iron is found in abundance near Coblenz, the Black Forest and the Pfalz possesses an apparently inexhaustible supply of lead, and zinc is found near Cologne and Aix-la-Chapelle. The mineral products of the district also include lignite, copper, manganese, vitriol, lime, gypsum, volcanic stones (used for millstones) and slates.

The mineral resources of the Prussian Rhine province, coupled with its favourable situation and the facilities of transit afforded by its great waterway, have made it the most important manufacturing district in Germany. The industry is mainly con-

centrated round two chief centres, Aix-la-Chapelle and Düsseldorf (with the valley of the Wupper), while there are naturally few manufactures in the hilly districts of the south or the marshy flats of the north. The largest iron and steel works are at Essen, Oberhausen, Duisburg, Düsseldorf and Cologne, while cutlery and other small metallic wares are extensively made at Solingen, Remscheid and Aix-la-Chapelle. The cloth of Aix-la-Chapelle and the silk of Crefeld form important articles of export. The chief industries of Elberfeld-Barmen and the valley of the Wupper are cotton-weaving, calico-printing and the manufacture of turkey red and other dyes. Glass is manufactured in the Saar district and beetroot sugar near Cologne. Though the Rhineland is *par excellence* the country of the vine, beer is largely produced; distilleries are also numerous, and large quantities of sparkling Moselle are made at Coblenz.

The population of the Rhine province in 1939 was 7,392,000. The province contains a greater number of large towns than any other province in Prussia and more than half the population is industrial and commercial. There are universities at Bonn (founded 1786 and refounded 1818) and Cologne (refounded 1918). For purposes of administration the province is divided into the five districts of Coblenz, Düsseldorf, Cologne, Aix-la-Chapelle and Trier. Coblenz is the official capital. The province is a modern creation, formed in 1815 out of the duchies of Cleves, Berg, Gelderland and Jülich, the ecclesiastical principalities of Trier and Cologne, the free cities of Aix-la-Chapelle and Cologne, and nearly 100 small lordships and abbeys.

RHINOCEROS, the name for such perissodactyle mammals (*see* PERISSODACTYLA) as bear one or two median horns on the head, and for their extinct relatives. Rhinoceroses are large, massively built animals, with little intelligence and a bad temper. The horns, which are composed of modified hairs, are borne on the nose and are used as weapons. The animals are dull of sight, but their hearing and scent are very acute. They are vegetarian in diet and largely nocturnal. The skin is very thick and tough. In the Miocene and Pliocene, rhinoceroses inhabited both eastern and western hemispheres, but they are now restricted to tropical Africa and Asia. An interesting feature is that the horn appears to have been independently evolved in several separate groups of rhinoceroses. Living forms fall into four genera: (1) With a single nasal horn and the thick skin raised into folds on the shoulders and thighs. There are two species. The Indian rhinoceros (*Rhinoceros unicornis*), standing 5-5½ ft. high at the shoulder, with a horn 1 ft. in length, is now confined to the Assam plain. The Javan rhinoceros (*R. sondaicus*) is smaller and in the female the horn is often absent. It inhabits Bengal, Burma, the Malay peninsula, Java, Sumatra and Borneo. It prefers hilly forests. (2) With a large nasal and a small frontal horn and the skin not thrown into folds. The only species is the Sumatran rhinoceros (*Rhinoceros or Dicerorhinus sumatrensis*), range as in the Javan species, except it does not extend into Java. It reaches a height of 4½ ft. and inhabits hilly forests. A form with hairy ears and skin is regarded as a local race. (3) With two horns, no skin folds and no lower incisors. This group is

BY COURTESY OF THE NAT. ZOOLOGICAL SOCIETY
GREAT INDIAN RHINOCEROS (*RHINOCEROS UNICORNIS*)

confined to Africa and comprises two species. The black rhinoceros (*Dicerorhinus bicornis*) is the smaller, weighing just over a ton, with a pointed, prehensile upper lip. It inhabits Africa south of Abyssinia, though in reduced and diminishing numbers, dwelling in the wooded, watered districts. (4) The white rhinoceros (*Ceratotherium simus*) is the largest living land mammal except the elephant and feeds largely on grass. It now inhabits only a reserve in Zululand and the Lado enclave on the Upper Nile. It may stand 5 ft. 8 in. at the shoulder and measure 15 ft. in length, but is very swift of foot. The flesh is said to be excellent to eat, especially in the autumn and winter.

The woolly rhinoceros (*R. antiquitatis*), which inhabited Europe, became extinct during the glacial epoch.

RHINTHON (c. 323–285 B.C.), Greek dramatist, son of a potter. He was probably a native of Synacuse and afterward settled at Tarentum. He invented the *hilarotragedia*, a burlesque of tragic subjects. He was the author of 38 plays, of which only a few titles (*Amphitryon*, *Heracles*, *Orestes*) and lines have been preserved chiefly by the grammarians, as illustrating the dialectic Tarentine forms. The metre is iambic, in which the greatest licence is allowed. The *Amphitruos* of Plautus, although probably initiated from a different writer (Archippus of the Middle Comedy), may be taken as a specimen of the manner in which such subjects were treated. There is no doubt that the hilarotragedia exercised considerable influence on Latin comedy, the *Rhinthonica* (i.e., fabula) being mentioned by various authorities among other kinds of drama known to the Romans. Scenes from these travesties are probably represented in certain vase paintings from lower Italy, for which see H. Heydemann, "Die Phylakendarstellungen auf bemalten Vasen," in *Jahrbuch des archäologischen Instituts*, i (1886).

See fragments in monograph by E. Völcker (Leipzig, 1887); E. Sommerbrodt, *De Phylacographia Græcorum* (Breslau, 1875); W. Christ, *Geschichte der griechischen Literatur* (1898).

RHIZOPODA, the name given by Felix Dujardin (*pro parte*, 1838) to a group of Sarcodine Protozoa. They are distinguished by their pseudopods, simple or branched, passing by wide bases into the general surface, never fine radial nor fusing into complex networks; skeleton absent or a simple shell ("test," "theca"), never (?) a calcareous shell, nor represented by a siliceous network, nor spicules. Reproduction is by binary fission; by division or abstriction of buds after the body has become multinucleate; or by the resolution of the body into numerous uniloculate zoospores (amoebulae or flagellulae) which may conjugate as gametes; plasmodium formation unknown; encystment (in "resting cysts" or "hypocysts") common. Without a knowledge of the history it is impossible to distinguish a naked Lobose from the Amoebula (pseudopodiospore) of a Myxomycete or Proteomyxan. As to the name, Dujardin included the thecate Lobosa, the Filosa and the Reticularia or Foraminifera. For further particulars see PAROTROZA.

RHODE ISLAND, popularly known as "Little Rhody," is a North Atlantic state of the United States, belonging to the New England group, and lying between approximately 41° 9' and 42° 3' N. and 71° 8' and 71° 53' W. It is bounded, north and east, by Massachusetts; south, by the Atlantic ocean; and west, by Connecticut, from which it is separated in part by the Pawcatuck river. Rhode Island is the smallest state in the union, having an extreme length, north and south, of 48 mi., an extreme width, east and west, of 37 mi. and a total area of 1,214 sq.mi., of which 157 sq.mi. are inland water area.

Physical Features.—The region of which Rhode Island is a part was at one time worn down to a gently rolling plain near sea level, but has since been uplifted and somewhat dissected by stream action. As a result the topography is characterized by low, rounded hills but is nowhere mountainous. Since the uplift and stream dissection a slight depression has allowed the sea to invade the lower portions of the river valleys, forming the bays known as Narragansett bay, Providence "river," Sakonnet "river," etc. Glaciation has disturbed the river systems.

In the northwest is Jerimoth hill, which attains an elevation of 812 ft., and is the highest point within Rhode Island. The mean elevation for the entire state is 200 ft. The coast line, including the shores of the bays and islands, is extensive; its western portion is only slightly indented, but its eastern portion is deeply indented by Narragansett bay, a body of water varying in width from 3 to 12 mi., and extending inland for about 28 mi. Within Narragansett bay there are the numerous islands characteristic of an area which has suffered comparatively recent depression, the largest being Rhode Island (or Aquidneck), Conanicut Island and Prudence Island. Of these the most important is Rhode Island, 15 mi. long and 3 mi. wide, which has given the state its name. Lying about 10 mi. off the coast and south of the central part of the state is Block Island.

The rivers of the state are short and of no great volume, but they flow swiftly and are useful in supplying power for manu-

facturing. The Providence river is really an arm of Narragansett bay, into which flow the waters of the Pawtuxet and the Blackstone rivers. The latter stream at Pawtuxet has a fall of about 50 ft., and the Pawtuxet river also has a number of falls along its course. Mount Hope bay is a northeastern arm of Narragansett bay and is also the estuary of the Taunton river. The Sakonnet river is a long bay separating Aquidneck or Rhode Island from the mainland on the east. The Pawcatuck river forms the boundary between Rhode Island and Connecticut.

History.—Rhode Island was founded by refugees from Massachusetts, who went there in search of religious and political freedom. The first settlements were made at Providence by Roger Williams (d.v.) in June 1636 and at Portsmouth on the island of Aquidneck by the Antinomians, William Coddington (1601–78), John Clarke (1609–76) and Anne Hutchinson (1591–1643), in March–April 1638. Becoming dissatisfied with conditions at Portsmouth, Coddington and Clarke moved a few miles farther south in April 1639, and established a settlement at Newport. In a similar manner Warwick was founded in Jan. 1643 by seceders from Providence under the lead of Samuel Gorton. The union of Portsmouth and Newport, March 12, 1640, was followed by the consolidation of all four settlements, May 19, 1647, under a patent of March 14, 1644, issued by the parliamentary board of commissioners for plantations. The particularistic sentiment was still very strong, however, and in 1651 the union split into two confederations, one including the mainland towns, Providence and Warwick; the other, the island towns, Portsmouth and Newport. A reunion was effected in 1654 by Roger Williams, and a charter was secured from Charles II on July 8, 1663.

In the patent of 1644 the entire colony was called Providence Plantations. On March 13, 1644, the Portsmouth-Newport general court changed the name of the island from Aquidneck to the Isle of Rhodes or Rhode Island. The official designation for the province as a whole in the charter of 1663, therefore, was Rhode Island and Providence Plantations. The charter was suspended at the beginning of the Sir Edmund Andros regime in 1686, but was restored again after the revolution of 1689. The closing years of the 17th century were characterized by a gradual transition from agricultural to commercial activities. Newport became the centre of an extensive business in piracy, privateering, smuggling and legitimate trade. Cargoes of rum, manufactured from West Indian sugar and molasses, were exported to Africa and exchanged for slaves to be sold in the southern colonies and the West Indies. The passage of the Sugar act of April 5, 1764, and the steps taken by the British government to enforce the Navigation acts seriously affected this trade.

The people of Rhode Island played a prominent part in the struggle for independence. On June 9, 1772, the "Gaspee," a British vessel which had been sent over to enforce the acts of trade and navigation, ran aground in Narragansett bay and was burned to the water's edge by a party of men from Providence. Nathanael Greene, a native of Rhode Island, was made commander of the Rhode Island militia in May 1775, and a major general in the Continental army in Aug. 1776, and in the latter capacity he served with ability until the close of the war. In the year 1776, Gen. William Howe sent a detachment of his army under Gen. Henry Clinton to seize Newport as a base of operations for reducing New England, and the city was occupied by the British on Dec. 8, 1776. To capture this British garrison, later increased to 6,000 men, the co-operation of about 10,000 men (mostly New England militia) under Maj. Gen. John Sullivan, and a French fleet carrying 4,000 French regulars under Count d'Estaing, was planned in the summer of 1778. On Aug. 9, Sullivan crossed to the north end of the island of Rhode Island, but as the French were disembarking on Conanicut Island, Lord Howe arrived with the British fleet. Count d'Estaing hastily re-embarked his troops and sailed out to meet Howe. For two days the hostile fleets manoeuvred for positions, and then they were dispersed by a severe storm. On the 20th, d'Estaing returned to the port with his fleet badly crippled, and only to announce that he should sail to Boston to refit. The American officers protested but in vain, and on the 30th the Americans, learning of the ap-

proach of Lord Howe's fleet with 5,000 troops under Clinton, decided to abandon the island. The British evacuated Newport on Oct. 25, 1779, and the French fleet was stationed there from July 1780 to 1781.

The influence of Roger Williams' ideas and the peculiar conditions under which the first settlements were established have tended to differentiate the history of Rhode Island from that of the other New England states. In 1640 the general court of Massachusetts declared that the representatives of Aquidneck were "not to be capitulated withal either for themselves or the people of the isle where they inhabit," and in 1644 and again in 1648 the application of the Narragansett settlers for admission to the New England confederacy was refused except on condition that they should pass under the jurisdiction of either Massachusetts or Plymouth. Rhode Island was one of the first communities to advocate and to put into practice religious freedom and political individualism.

The individualistic principle was shown in the jealousy of the towns toward the central government, and in the establishment of legislative supremacy over the executive and the judiciary. The legislature migrated from county to county up to 1854, and there continued to be two centres of government until 1900. The dependence of the judiciary upon the legislature was maintained until 1860, and the governor is still shorn of certain powers which are customary in other states. In the main the rural towns have adhered most strongly to the old individualistic sentiment, whereas the cities have kept more in touch with the modern nationalistic trend of thought. This was shown, for example, in the struggle for the ratification of the federal constitution. Under the Articles of Confederation it was principally Rhode Island that defeated the proposal to authorize congress to levy an impost duty of 5% mainly as a means of meeting the debts of the central government. When the Constitutional Convention met in Philadelphia in 1787 to frame a constitution for a stronger federal government, the agriculturists of Rhode Island were afraid that the movement would result in an interference with their local privileges, and the state refused to send delegates, and not until the senate had passed a bill for severing commercial relations between the United States and Rhode Island did the latter, in May 1790, ratify the federal constitution, and then only by a majority of two votes. Rhode Island, like the rest of New England, was opposed to the War of 1812 and the Mexican War. During the Civil War it sent 23,457 men into the service of the Union.

Providence possesses superior water-power facilities and has therefore become one of the leading manufacturing centres of New England, whereas Newport is known as a fashionable summer resort and naval port.

The charter of 1663 and franchise law of 1724 established substantial equality of representation among the towns, and restricted the suffrage to freeholders. In the course of time, therefore, the small towns came to be better represented proportionally than the large cities, and the growing class of artisans was entirely disfranchised. Providence issued a call for a constitutional convention in 1796, and similar efforts were made in 1799, 1817, 1821, 1822 and 1824, but nothing was accomplished. About 1840 Thomas W. Dorr (1805-54), a young lawyer of Providence, began a systematic campaign for an extension of the suffrage, a reappointment of representation and the establishment of an independent judiciary. The struggle, which lasted for several years, and in fact continued at mid-20th century, was one between the cities and the country, between the manufacturers and the agriculturists.

A convention summoned without any authority from the legislature and elected on the principle of universal manhood suffrage met at Providence, Oct. 4 to Nov. 18, 1841, and drafted a frame of government which came to be known as the People's constitution. A second convention met on the call of the legislature in Feb. 1842 and adopted the so-called Freeman's constitution. On being submitted to popular vote (on Dec. 27, 28 and 29, 1841) the former was ratified by a large majority, while the latter was rejected (on March 21, 22 and 23, 1842), by a majority of 676. At an election held on April 18, 1842, Dorr was chosen governor.

The supreme court of the state and the president of the United States (John Tyler) both refused to recognize the validity of the People's constitution, whereupon Dorr and a few of his more zealous adherents decided to organize a rebellion. They were easily repulsed in an attack upon the Providence town arsenal, and Dorr, after a brief period of exile in Connecticut, was convicted of high treason on April 26, 1844, and was sentenced to imprisonment for life. He was released by act of the assembly in June 1845, and restored to the rights and privileges of citizenship in May 1851.

The Freeman's constitution, modified by another convention, which held its session at Newport and East Greenwich on Sept. 12 to Nov. 5, 1842, was finally adopted by popular vote on Nov. 21-23, 1842. Only a partial concession was made to the demand for reform. The suffrage, was extended to nonfreeholders, but only to those of American birth. But a constitutional amendment of 1888 extended to naturalized citizens the right of suffrage in state and national elections, and an amendment of 1909 partially remedied the evils in the system of apportionment.

Inequalities still existed, however, as can best be illustrated by Providence, which, with a population in 1927 of 280,600 out of a total of 740,000, had one member in a senate of 39 and 25 members in a house of representatives of 100. This inequality was somewhat modified by constitutional amendment in 1928. The Republicans controlled the state government, Democrats being elected only occasionally. In 1922 the Democratic candidates for governor, lieutenant governor, attorney general and treasurer were elected, although the Republicans retained control of both branches of the general assembly. A long struggle in the senate culminated in the Republican members leaving for Rutland, Mass., on June 19, 1924, where they stayed until Jan. 5, 1925. The Democratic minority continued to meet daily, however, until the newly elected senate took office. The legislative business of the state was practically at a standstill for a year, and the failure of passage of the annual appropriation bill in 1924 led to the advancing of money to the state by private individuals and by 23 Rhode Island banks.

In common with other New England states Rhode Island's cotton manufacturing industries suffered from southern competition. The south's advantage of raw material and cheap labour was overcome in part, however, by Rhode Island's manufacturing its own mill machinery and by training skilled workers in its textile schools, to produce a higher quality of goods. In 1923 a mother's aid law came into effect; and a state law raising the minimum working age to 15 years (with certain exceptions) came into effect in 1924.

In presidential elections the state was Federalist, 1792-1800; Democratic Republican, 1804; Federalist, 1808-12; Democratic Republican, 1816-20; John Quincy Adams (Republican), 1824-28; National Republican, 1832; Democratic, 1836; Whig, 1840-48; Democratic, 1852; and thereafter Republican, except in 1912, until 1928, when Alfred E. Smith carried the state. The Democrats continued to win in the presidential elections of 1932-48 by large pluralities.

Climate.—Rhode Island has a more moderate climate than that of the northern sections of New England. There are no great extremes of either heat or cold, and a number of the towns and cities, especially Newport and Narragansett Pier, became noted summer resorts. Narragansett Pier has a mean annual temperature of 50° F., a mean summer temperature (for June, July and August) of 68°, and a mean winter temperature (for December, January and February) of 30°. The mean annual temperature at Providence is 50.5°; the mean for the summer, 70.1°; and for the winter, 30.2°; while the highest and lowest temperatures ever recorded are respectively 102° and -17°. The mean annual precipitation is about 38.68 in.

Population.—The population of Rhode Island in 1790 was 68,825; in 1840 it was 108,830; in 1880, 276,531; in 1910, 544,610; in 1940, 713,346; and in 1950, 791,896. This last figure represented an increase of 11% over the population in 1940. The population per square mile in 1950 was 749.2, as compared with 674.2 in 1940 and with 50.7 for the U.S. in 1950.

The urban area of Rhode Island in 1940 comprised 7 cities, the smallest having a population of nearly 30,000, and 12 towns (townships) classified as urban under a special rule in accordance with which the entire town was classified as urban in any case where more than half the population of the town lived in a village (or villages) having 2,500 inhabitants or more. This rule was justified by the fact that no provision was made in Rhode Island for the incorporation of places smaller than the cities. The urban population in 1940, under this definition, was 553,383, or 91.6% of the state total. The population of the same area in 1950 was 700,410, or 7.1% more than in 1940, and represented 88.4% of the state total.

BY COURTESY OF THE U. S. BUREAU OF THE CENSUS

URBAN AND RURAL POPULATION OF RHODE ISLAND, 1870 TO 1950

The vertical-lined section of the 1950 bar represents the amount by which the population that would have been counted as urban under the 1940 definition exceeds the "new" urban population

Prior to the enumeration in 1950, boundaries were set up for the thickly settled suburban area, or "urban fringe," around Providence and Pawtucket, and also for villages outside the urban fringe, so that these might be enumerated separately from the remainder of the town in which they were located. The 1950 urban area comprised all the cities, the urban fringe around the two larger cities and four unincorporated places (villages for which arbitrary boundaries had been set up) of 2,500 or more. Of the 12 special-rule towns of 1940, 1 was found to contain no village of as much as 2,500, 3 contained villages of urban size and 8 were partly within the urban fringe of one of the larger cities. In addition there was one unincorporated place of urban size in another town. The 1950 urban area had thus gained, as compared with that of 1940, by the addition of considerable suburban territory, but not enough to offset the area lost by the dropping of the outlying parts of the 1940 special-rule towns.

The urban population under the new 1950 definition was thus only 667,212, representing 84.3% of the state total, or considerably less than the 1950 population of the 1940 area given above. This situation was in marked contrast with that in most other states, where the new definition resulted in a larger urban area.

Area	Population			Per cent of increase	
	1950	1940	1930	1940-50	1930-40
The state	791,805	743,346	687,497	11.0	3.8
Urban	700,410*	553,383	634,549	25.1	12.8
Rural	124,684	59,963	52,948	107.9	15.3
Per cent urban	88.4	74.6	92.4	—	—
Principal cities					
Providence	248,604	253,504	252,081	-1.9	0.8
Pawtucket	81,436	75,797	77,149	7.4	-1.8
Cranston	55,000	47,083	41,011	35.0	9.7
Woonsocket	30,211	49,393	49,376	-3.8	-0.1
Warwick	43,638	28,757	23,196	49.6	24.0
Newport	37,854	30,433	27,612	23.0	10.6

*Final figures for 1950 based on new definition. See comment in text.

The number of households in 1950 was 225,487, as compared with 187,706 in 1940. The average population per household had declined from 3.8 in 1940 to 3.5 in 1950.

The population of the state was distributed by colour and nativity in 1950 as follows: 83.8% native white; 14.3% foreign-born white; and 1.9% nonwhite, practically all Negro. Of the

foreign-born white population, 21.5% was born in Italy, 16.9% was Canadian-French and 12.6% was born in England or Wales. There were 98.9 males per 100 females in the native white population and 89.8 in the foreign-born white; 8.8% of the population was 65 years old or over; and 56.0% of the population 14 years old and over was in the labour force.

Of the total number of employed males, 2.1% was engaged in agriculture, 8.2% in construction, 41.3% in manufacturing and 23.2% in transportation and trade.

Government.—Rhode Island is governed under the constitution of 1842, with amendments adopted in 1854, 1864, 1886, 1888, 1889, 1892, 1893, 1900, 1903, 1909, 1911, 1916, 1928, 1930, 1944 and 1948.

Amendments must be passed by both houses of the general assembly and by two consecutive legislatures, and must then be approved by three-fifths of the electors of the state voting thereon.

The executive and administrative officers elected by the people at elections held in November of even-numbered years are a governor, a lieutenant governor, a secretary of state, an attorney general and a treasurer. By an administrative code enacted by the general assembly in 1935 and amended in 1939 and 1949, there are 14 major administrative departments, designated as executive department, department of state, department of the attorney general, treasury department and the departments of finance, social welfare, public works, business regulation, education, labour, agriculture and conservation, health, civil service, and employment security. The first four are headed by the governor, secretary of state, attorney general and treasurer, respectively, the next nine each by a director and the last by an administrator, appointed by the governor with the consent of the senate. Most of the work of administration that was formerly distributed among numerous boards and commissions was consolidated into the departments named above. There remained a few independent agencies, including the sinking fund commission, commission on interstate co-operation, commission on uniform state laws, retirement board, etc.

The powers of the governor were somewhat extended by legislative enactment over their former scope.

The 11 judges of the superior court, the district judges and the juvenile court judges are appointed by the governor with the advice and consent of the senate. The superior court judges hold office during good behaviour, the district judges for a term of three years and the juvenile court judges for a term of ten years.

Finances.—The valuation of rateable property in the several towns and cities, as returned by the boards of assessors on June 15, 1950, was \$1,859,036,990.26. The rate of state tax in 1934 was four cents on each \$100, but state taxes on cities and towns were repealed on May 31, 1935. For the fiscal year ending June 30, 1950, revenue receipts were \$37,058,591.82; expenditures and encumbrances \$38,080,727.74; general net debt \$40,932,473.59; and sinking fund \$5,004,526.41. The net debt increased \$4,932,541.43 during the year. The chief sources of revenue were: automobile licences, the gasoline tax, the tax on savings deposits, the financial institutions excise tax, business corporate taxes on net income, corporate excess and franchise tax, inheritance taxes, the tax on insurance premiums, the gross earnings tax on public service corporations, the horse-racing tax, the cigarette tax, the unincorporated business tax and the 1% selective sales tax.

Expenditures for the fiscal year 1949-50 were as follows: executive department \$1,316,611.64; department of state \$175,866.39; department of the attorney general \$125,750.05; treasury department \$69,388.06; department of finance \$576,624.47; department of social welfare \$20,192,453; department of public works \$6,868,297.44; department of business regulation \$274,407.02; department of education \$4,178,408.60; department of labour \$281,778.70; department of agriculture and conservation \$726,517.17; department of health \$2,036,405.24; department of civil service \$146,349.89; legislative \$181,603.04; judiciary \$714,157.05; state colleges \$1,336,419.66; other commissions and agencies \$163,989.17; pension and retirement salaries \$1,526,702.33;

debt service \$2,312,677.18; general \$4,021,943.37; support of certain organizations \$83,950.

On June 30, 1950, there were 30 banking institutions within the state with resources of \$1,277,763,804.53 and deposits of \$1,007,427,952.89.

Education.—The public-school system of Rhode Island was established in 1800, abolished in 1803 and re-established in 1828. At the head of it is the director of the department of education appointed by the governor with the consent of the senate to serve at the pleasure of the governor. Each town has a school committee elected by the people and independent of the town or city council. School attendance is compulsory for children between the ages of 7 and 16. An act to promote Americanization was passed in 1919 obliging illiterate minors (16-21) to attend evening school. Rhode Island in 1917 accepted the provisions of the federal vocational act, and a part-time trade school was opened for boys over 14 years of age at Providence and subsequently at Newport, Westerly, West Warwick, Cumberland, Central Falls and Pawtucket. Also there are 10 centres where instruction is given in vocational agriculture, 14 for instruction in home economics and 2 for instruction in the distributive occupations.

The total population between 5 and 17 years of age, as shown by the 1950 school census, was 132,898. The average number attending the public schools in 1949-50 was 90,507; the total expenditure for school purposes in 1949-50 was \$19,292,010.47.

The institutions of higher education supported by the state are the Rhode Island College of Education at Providence and Rhode Island State college at Kingston, a land-grant college under the Morrill acts of 1862 and subsequent acts. There are opportunities for training teachers under teacher critics at all the cities of the state—Providence, Central Falls, Cranston, Newport, Pawtucket, Warwick and Woonsocket—and at several of the towns. Training schools for teachers are conducted at Rhode Island State college, Rhode Island College of Education, Brown university, Providence college, Rhode Island School of Design and Bryant college. The state also makes appropriations for state scholarships (\$75,000 in 1950) to institutions for higher education other than those supported by the state, viz., Brown university, Rhode Island School of Design, Rhode Island College of Pharmacy and Allied Sciences, Providence college and Bryant college.

Charities and Corrections.—Most of the charitable and penal institutions are administered by the department of social welfare. Those so administered in 1950 were the Exeter school (for feeble-minded) at Exeter; the children's centre of Rhode Island (for dependent children) at Providence; the veterans' home at Bristol; a group of institutions at Cranston, including the state hospital for mental diseases, the state infirmary, the reformatory for women, the state prison and county jail, the reformatory for men, the training school for boys and the training school for girls. In addition to the institutions under the jurisdiction of the department of social welfare, there were the School for the Deaf at Providence under the state department of education and the state sanatorium (for tuberculosis) at Wallum Lake under the state department of health.

Agriculture.—Rhode Island ranks low in the list as an agricultural state, chiefly because of the smallness of the state and the sterile nature of the soil. The boulder clay or hardpan of which most of the surface lands are composed forms a very indifferent support for vegetation. Rhode Island had receipts from sale of principal farm products in 1949 of \$23,179,000. The farm acreage declined from 308,000 ac. in 1935 to 222,000 ac. in 1940 and increased to 252,731 ac. in 1949. Of this total only 67,725 ac. were classed as cropland, 81,130 ac. as improved land and 109,876 ac. as pasture and woodland. The number of farms declined from 4,327 in 1935 to 3,014 in 1940 and then increased to 3,600 in 1950. Only 312 or 8.7% of the 3,603 farms in 1945 were cultivated by tenants. The values of farmland and buildings in 1950 were approximately \$39,466,560 and \$29,494,080 respectively. The chief crop in 1950 was cultivated hay. The 37,000 ac. devoted to hay produced 54,000 tons; potatoes, 5,100 ac. produced 1,275,000 bu.; corn, 8,000 ac. produced 336,000 bu.; oats,

1,000 ac. produced 34,000 bu.; alfalfa, 1,000 ac. produced 2,000 tons. Apples were the principal orchard crop. There were produced apples, 248,000 bu.; peaches, 4,000 bu.; pears, 9,000 bu.; grapes, 270 tons. The livestock products of Rhode Island are of greater value than the field crops. Livestock on the farms on Jan. 1, 1950, consisted of about 1,000 horses, 9,000 swine, 2,000 sheep and 27,000 cattle. Of the latter, 21,000 were kept for dairy purposes. There were 604,000 hens, 5,000 turkeys and 1,000 colonies of bees.

Minerals.—Rhode Island in mineral wealth ranked 47th among the states of the Union in 1948. The total value of all mineral products of the state in that year was \$1,450,000, and of this total sand and gravel was valued at \$728,990 and stone at \$536,651.

Products in order of value were sand and gravel, stone and graphite.

Fisheries.—Whaling was early an established industry in Rhode Island. As late as 1846 about 50 whaling vessels sailed annually from Rhode Island ports; but by the close of the century the industry had become practically extinct. Rhode Island in 1950 ranked third among the New England states in the number of persons engaged, investment and yield of its fisheries. In 1950 the total number of persons employed in all fisheries was 2,275, of whom 1,450 were in the shore and boat fisheries. The year's catch was 26,370,500 lb., of which 19,586,700 lb. were boat fish, value \$1,509,179, and 6,783,800 lb. were shellfish, value \$3,337,741. Total value was \$4,846,920.

Manufactures.—Rhode Island is essentially a manufacturing state; of the 301,469 persons in the state engaged in gainful occupation in Oct. 1950, 152,778 or 50.7% were employed in manufacturing. Rhode Island is the most industrialized state in the nation, as of 1947, with 172 out of every 1,000 in its population working in factory jobs. Boatbuilding was an early industry, and large vessels were built at Newport. During the Revolutionary War the state offered a premium for every pound of steel made within its boundaries. A company to spin cotton, formed at Providence in 1786, established there in the following year a factory containing a spinning jenny of 28 spindles (the first machine of its kind to be used in the United States), and also a carding machine. The fly shuttle was first introduced at Providence in 1788. In 1790 there was established at Pawtucket a factory equipped with Arkwright machines constructed by Samuel Slater, an immigrant from England. This machine was operated by water power; and from this may be dated the beginning of the factory system in Rhode Island. The first power loom used in the United States was set up at Peacevale in 1814.

The manufacture of jewellery, which was started in Providence in 1784, was greatly promoted ten years later by Nehemiah Dodge's invention of the process of "gold filling" and was still further improved in 1846 by Thomas H. Lowe. Rhode Island's water power has been its only natural resource which has aided its development.

The number of establishments engaged in manufactures was 2,214 in 1947 and 1,399 in 1939; number of production workers was 128,130 in 1947 and 106,089 in 1939; value added by manufacture was \$658,420,000 in 1947 and \$237,698,000 in 1939. In

Industry	No. of establishments	All employees	Value added by manufacture ('000's)
Food and kindred products	216	4,530	\$ 22,084
Textile-mill products	374	62,500	289,104
Apparel and related products	81	7,841	9,517
Lumber and products except furniture	58	580	2,476
Furniture and fixtures	34	702	2,018
Paper and allied products	33	2,080	8,467
Printing and publishing	230	3,458	15,045
Chemicals and allied products	59	1,340	10,220
Rubber products	14	6,315	27,108
Leather and leather products	27	430	1,835
Stone, clay and glass products	35	1,053	492
Primary metal industries	47	5,009	28,588
Fabricated metal products	221	7,845	38,240
Machinery (except electrical)	219	17,310	100,170
Electrical machinery	26	5,280	44,113
Transportation equipment	30	274	891
Instruments and related products	86	2,721	8,154
Jewellery and silverware	248	10,425	50,888
Costume jewellery	132	8,500	33,592

1947 textiles held the first place among the manufactures of the state. Other important manufactures were jewellery, rubber goods, metal products and machinery. The accompanying table shows the 19 principal manufacturing industries in 1947, the number of active establishments, persons employed and value added by manufacture

Transportation and Commerce.—The steam railway mileage in Rhode Island never was great because the cities are unfavourably situated to be the termini of interstate railway systems. The total mileage within the state decreased from 205 mi. in 1934 to 185 mi. in 1949. The mileage of electric railways decreased from 183 mi. in 1932 to 86 mi. in 1941 to 82 mi. in 1949.

Much attention was given to the state's highway system. The total mileage in the state system of highways on Jan. 1, 1951, was 1,300 mi., of this total 839 mi. were surfaced. In 1949 \$5,837,517 was spent by the state for the construction and maintenance of roads.

Rhode Island has water outlets at Providence (by far the largest), Newport, Pawtucket, Bristol, Tiverton and Wickford. There are also harbours of refuge at Block Island and Point Judith. The water-borne commerce of the state in 1949 consisted of 717,367 tons of imports, 9,014 tons of exports, 7,044,327 tons of goods received in the coastwise trade and 587,783 tons of goods shipped in that trade. 105,402 tons of goods received in the internal trade and 105,804 tons of goods shipped in that trade. Total water-borne commerce of Rhode Island in 1949 was 8,623,810 tons; in 1940 it was 6,186,513 tons. The foreign trade of the state in 1940 amounted to 335,208 tons of imports and 32,549 tons of exports.

Bibliography.—For general physical description see: N. S. Shaler, I. B. Woodworth and A. F. Foerste, *Geology of the Narragansett Basin* (1895) and C. T. Jackson, *Report on the Geological and Agricultural Survey of Rhode Island* (1840). For administration see the *Rhode Island Manual*, issued biennially by the Secretary of State; C. Carroll, *Outline of Government in Rhode Island*, in *Rhode Island educational circulars*; and the annual reports of the various state officials, boards and commissions. For general bibliographies see J. R. Barlett, *Bibliography of Rhode Island* (1864); C. S. Brigham, *List of Books upon Rhode Island History* (1908) in *Rhode Island Educational Circulars*, History Series no. 1; and H. M. Chapin, *Bibliography of Rhode Island* (1914) and *Cartography of Rhode Island* (1915). *History*.—For a considerable time the standard authority on the period before the ratification of the constitution was S. B. Arnold, *History of Rhode Island, 1639-1790* (1859-60, 4th ed. 1894). His work, however, has been practically superseded by I. B. Richman, *Rhode Island: Its Making and Meaning, 1639-1683* (1903) and *Rhode Island: A Study in Separatism* (1905). See also, for this period, T. W. Bicknell, *The History of Rhode Island and Providence Plantations* (1920). E. Field (editor), *State of Rhode Island and Providence Plantations at the End of the Century; A History* (1902) is valuable for the later history of the state. Two works of special interest for young readers are H. W. Preston, *Rhode Island's Historic Background* (1930) and A. C. Gleason, *Colonial Rhode Island* (1926). See also A. Gorton, *The Life and Times of Samuel Gorton* (1908); O. S. Straus, *Roger Williams, The Pioneer of Religious Liberty* (1906); A. M. RHODES, CECIL JOHN (1853-1902), British colonial and Imperial statesman, was born on the 5th of July 1853, at Bishop Stortford, in Hertfordshire. His father was a clergyman, but he claimed descent from yeoman stock. Cecil John Rhodes was the fifth son in a large family of sons and daughters. The boy was educated at the grammar school of Bishop Stortford, where

his father held the living, with the intention of preparing for the Church; but at the age of sixteen his health broke down, and in the latter part of 1870 he joined his eldest brother Herbert, then engaged in farming in Natal. In that year diamonds were discovered in the Kimberley fields. By the end of 1871 Rhodes and his brother were among the successful diggers. The dry air of the interior restored his health, and before he was nineteen he found himself financially independent and physically strong.

Rhodes next spent eight months in a solitary journey through the then little known parts of the country lying to the north of the Orange and Vaal rivers. He went through Bechuanaland to Mafeking, thence to Pretoria, Murchison, Middelburg and back through the Transvaal to Kimberley, passing in an ox-wagon at a rate of some 15 to 20 miles a day, through vast spaces of rolling veld. He saw one of the healthiest countries in the world hardly occupied. He knew the agricultural possibilities of Natal and its mineral wealth. The effect of the combined influences on his mind was profound. He was filled with desire that that fine country be secured for occupation by the British race, and that no power but Great Britain be allowed to dominate in the administration of South Africa. He had found an object to which he proposed to devote his life. It was nothing less than the governance of the world by the British race. A will exists written in Rhodes's own handwriting, when he was still only twenty-two, in which he states his reasons for accepting the aggrandizement and service of the British empire as his highest ideal of practical achievement. It ends with a single bequest of everything of which he might die possessed for the furtherance of this great purpose. Five-and-twenty years later his final will carried out, with some difference of detail, the same intention.

The share which he allotted to himself was the extension of the area of British settlement in Africa. He returned to Oxford, where he matriculated at Oriel. In 1873 his health again failed, and he was sent back under what was practically a death sentence. Years afterwards, as an older man, he saw the entry of his own case in the diary of the eminent physician whom he consulted with a note "Not six months to live." South Africa again restored him to health. Three years later he was back at Oxford, and from 1876 to 1878 he kept his terms. During this period he spent the Long Vacation each year in South Africa, where his large financial interests were daily increasing in importance. He was a member of the Cape ministry when after a further lapse of years he kept his last term and took his degree. He did not read hard at Oxford and was more than once remonstrated with in the earlier terms for non-attendance at lectures. But he passed his examinations; and though he was never a student in the university sense of the term, he was to the end of his life a keen devourer of books. He kept always a special liking for certain classic authors. Aristotle was the guide whom as a lad he followed in seeking the "highest object" on which to exercise the "highest activity of the soul." Marcus Aurelius was his constant companion. There exists, at Groote Schuur a copy of the *Meditations* deeply scored with his marks.

During this Oxford time and to 1881 Rhodes was occupied with the amalgamation of the larger number of the diamond mines of Kimberley with the De Beers Company, an operation which established his position as a practical financier in the business world. To many admirers who shared his views on public questions his connection with the financial world and his practical success were a stumbling block. It was often wished for him that he "had kept himself clear of all that." But this was not the view he took of the matter. His ideals were political and practical. To him the making of money was a necessary preliminary to the realization of his political ideals, and he was proud of his practical ability in this direction. He was a man of simple tastes. His immense fortune was spent in the furtherance of his ideas, and it has been justly said of him that he taught the world a new chapter of the romance of wealth.

In 1881 Mr. Rhodes entered the Cape assembly as one of the two members for Barkly West and kept the seat for life. It was the year of the Majuba settlement. South Africa was convulsed

with questions between the British and the Dutch, and leaders of Dutch opinion at the Cape spoke openly of the formation of a United States of South Africa under its own flag. The British party needed a rallying-ground, when Cecil Rhodes offered to Dutch and British alike the ideal of a South African Federation governing itself within the empire, and extending, by its gradual absorption of native territories, the range of Imperial administration. Local self-government was, in his opinion, the only enduring basis on which the unity of the empire could be built, and throughout his life he was as keen a defender of local rights as he was of Imperial unity. There was a time when his advocacy of the elimination of direct Imperial interference in local affairs caused him to be viewed in certain quarters as a Separatist. Such suspicions were strengthened at a critical moment in the struggle for Home Rule in Ireland by his contributing £10,000 to the funds of the Nationalist party. The subsequent publication of his correspondence on the subject with Mr. Parnell demonstrated, however, that Rhodes's contribution was made strictly subject to the retention of the Irish members at Westminster. He remained of the opinion that the Home Rule movement, wisely treated, would have had a consolidating effect upon the empire.

In South Africa the influence which he acquired over the local independents and over the Dutch vote was subsequently an important factor in enabling him to carry out the scheme of northern expansion which he had fully developed in his own mind at Oxford in 1878. In 1881 the Bechuana territory was a sort of no man's land through which ran the trade routes to the north. It was evident that any power which commanded the trade routes would command the unknown northern territory beyond. The Pretoria Convention of 1881 limited the westward expansion of the Transvaal to a line east of the trade routes; but the irregular overflow into native territories made Rhodes fear that British expansion would be permanently blocked by Dutch occupation. One of his first acts as a member of the Cape assembly was to urge the appointment of a delimitation commission. He served on it in person, and obtained from Mankodane, who claimed about half of Bechuanaland, a formal cession of his territories to the British government of the Cape. The Cape government refused to accept the offer. In February 1884 a second convention signed in London again defined the western frontier of the Transvaal, Bechuanaland being left outside the republic. With the consent of Great Britain, Germany had occupied, almost at the same time, the territory on the Atlantic coast later known as German South-West Africa. In August 1884 Rhodes was appointed resident deputy commissioner in Bechuanaland, where Boers had ousted the natives from considerable areas and set up the so-called republics of Goshen and Stellaland. An old Dutchman said privately to Rhodes, "This is the key of South Africa." The question at issue was whether Great Britain or the Transvaal was to hold the key. It was a question about which the British public knew and cared nothing. Rhodes made it his business to enlighten them. President Kruger, speaking for the government of the Transvaal, professed to regard the Dutch commandos as freebooters, whom he was unable to control. Largely as the result of Rhodes's exertions the Warren expedition of 1884-85 was sent out. In the presence of British troops and Rhodes upon the frontier President Kruger withdrew the commandos without any fighting, and south Bechuanaland became British territory, while a British protectorate was declared over the northern regions up to the 22nd parallel (September 1885).

It was the first round in the long duel between Cecil Rhodes, representative of British interests, and President Kruger, head of the militant Dutch. The score was to Rhodes. The entrance to the interior was secured, but the 22nd parallel was far short of the limits to which Rhodes hoped to see British influence extend, and he feared lest Germany and the Transvaal might together bar his progress. The discovery of gold on the Witwatersrand in 1886, by adding to the wealth and importance of the Transvaal, gave substance to this fear.

The territory north of the 22nd parallel was under Lobengula, chief of the Matabele, a native potentate celebrated alike for his ability and for his despotic character. There were rumours of

Dutch and German emissaries at his kraal engaged in persuading him to cede portions of his territory. Portugal also was putting forward shadowy claims to the country. Rhodes conceived the idea of forming a British Chartered Company, which should occupy the territory for trading and mining purposes as far as the Zambesi, and bring the whole under the protection of Great Britain. Rhodes's first emissaries were sent to Lobengula in 1887 and the charter of the British South Africa Company was granted in October 1889. Crossing the Zambesi at the back of the Portuguese settlements, Rhodes obtained permission to extend the territories of the Chartered Company to the southern end of Lake Tanganyika and the British settlements already made in Nyasaland. He hoped to create a connected chain of British possessions which might justify the words, "Africa British from the Cape to Cairo," but the treaty between Great Britain and Germany in 1890, by extending the German sphere of influence to the frontier of the Congo Free State, defeated this hope. But Rhodes did not even then wholly renounce the idea. In 1892 when the question of the retention or abandonment of Uganda hung in the balance at home, he threw all the weight of his influence into the scale of retention, and offered at his own personal expense to connect that territory by telegraph with Salisbury. In 1893, a war with the Matabele added to the British empire about 450,000 square miles of country, of which large portions consist of healthy uplands suitable for white colonization. The pioneer party crossed the frontier at the end of 1893. In six years, though the country had passed through the trial of a war, two native rebellions, and the scourge of rinderpest, it had become Rhodesia, a well-settled province of the British empire, with a white population of some 12,000 persons.

In 1890, Rhodes became prime minister of the Cape. Maintained in power very largely by the Dutch vote, which he spared no pains to conciliate, and having won the confidence of both sections of the colony, he was practically a despot in South Africa. He did much to elevate and to enlarge the field of local politics. He frankly declared and worked for the policy of uniting British and Dutch interests in South Africa; he took a keen interest in local education. He restricted the franchise, introducing an educational test and limiting the vote to men with an income equal to a labourer's wage—thus abolishing, without making any distinction of colour, the abuses of the "blanket" vote.

His native policy was far from being one of simple restriction. He liked the natives; he employed them by thousands in the mining industry, and was successful in dealing with them. The first canon of his native policy was that liquor should be kept from them; the second, that they should be guaranteed the earnings of their labour; the third, that they should be educated in the practical arts of peace. He appreciated the full importance of raising their territorial condition from one of tribal to individual tenure; and while he protested against the uncivilized Kaffir voting on questions of highly civilized white policy, he believed in the principle of self-government in native affairs. Of these views some received practical embodiment in the much-disputed act known as the Glen Grey Act of 1894. In this connection it may also be noted that he was one of the warmest and most convinced supporters of Lovedale, the very successful missionary institution for the education of natives in South Africa.

The position of benevolent despot has obvious drawbacks. In Rhodes's case the dependence which the populations of Cape Colony were led to place on him had its reaction on the public in a demoralizing loss of self-reliance, and for himself it must be admitted that the effect on the character of a man already much disposed to habits of absolutism in thought and action was the reverse of beneficial. Rhodes felt himself to be far stronger than any man in his own surroundings; he knew himself to be actuated by disinterested motives in the aims which he most earnestly desired to reach. He was profoundly impressed by a sense of the shortness of life, and he so far abused his power as to become intolerant of any sort of control or opposition. The inevitable result followed, that though Rhodes did much of great and good work during the six years of his supreme power, he entirely failed during that period to surround himself, as he

might have done, with a circle of able men fit to comprehend and carry on the work to which his own best efforts were directed. To work with him was practically impossible for those who were not willing to accept without demur the yoke of dogmatic authority. He had a few devoted personal friends who appreciated his aims and were inspired by his example; but he was lacking in regard for individuals, and a great part of his daily life was spent in the company of satellites and instruments, whom he used with cynical unconcern for the furtherance of his ends.

In 1896 the brilliant period of his premiership was brought to an end by the incident which became famous under the name of the Jameson Raid. The circumstances which led to the raid belong properly to the history of the Transvaal. It is enough to say briefly here that the large alien population which had been attracted to the Transvaal by the phenomenal wealth of the Johannesburg gold fields, conceiving itself to have reason to revolt against the authority of the Transvaal government, resolved toward the end of 1895 to have recourse to arms in order to obtain certain reforms.

Rhodes, as a large mineowner, was theoretically a member of the mining population. In this capacity he was asked to give his countenance to the movement. But as prime minister of a British colony he was evidently placed in a false position from the moment in which he became cognizant of a secret attempt to overturn a neighbouring government by force of arms. He did more than become cognizant. The subsequent finding of a Cape committee, which he accepted as accurate, was to the effect that "in his capacity as controller of the three great joint-stock companies, the British South Africa Company, the De Beers Consolidated Mines, and the Gold Fields of South Africa, he directed and controlled the combination which rendered such a proceeding as the Jameson Raid possible." He gave money, arms and influence to the movement; and as the time fixed for the outbreak of the revolution approached, he allowed Dr. Jameson, who was then administrator of the British South Africa company in Rhodesia, to move an armed force of some 500 men upon the frontier. Here Rhodes' participation in the movement came to an end. It became abundantly clear from the subsequent inquiry that he was not personally responsible for what followed. A cipher correspondence, seized and published by the Boers, left the civilized world in no doubt as to Rhodes' share in the previous preparation, and he was for a time believed to be responsible for the raid itself. Subsequent inquiries held by committees of the Cape parliament and of the British house of commons acquitted him entirely of responsibility for Dr. Jameson's final movement, but both committees found that he had acted in a manner which was inconsistent with his duty as prime minister of the Cape and managing director of the British South Africa company.

He made no concealment of his own share in the catastrophe; he took full responsibility for what had been done by subordinates, and accepted the consequences which ensued. He resigned his premiership of the Cape (Jan. 1896), and turned his attention to the development of Rhodesia. His design was to live in the country and to give all the stimulus of his own presence and encouragement to the development of its resources. The Matabele rebellion of March 1896 intervened, and in June Imperial troops were sent up and drove the natives to a practically impregnable position in the Matoppo hills.

The prospect before the British was one of continued war with a renewal of a costly campaign in the following spring. Rhodes conceived the idea that he might effect singlehanded the pacification which military skill had failed to compel. To succeed, it was essential that he should trust and be trusted. He moved his tent away from the troops to the base of the Matoppo hills, and lay there quietly for six weeks, in the power of the enemy if they had chosen to attack. Word was circulated among the natives that he had come alone and undefended to hear their side of the case. A council was held by them in the very depths of the hills, where no armed force could touch them. He was invited to attend it. It was a case of staking his life on trust. He displayed no hesitation, but mounted and rode unarmed with the messenger. Three friends rode with him. They met the assembled chiefs who

laid the native grievances before them. At the end of a long discussion Rhodes, having exacted such concessions as he thought fit, asked the question, "Now, for the future is it peace or is it war?" And the chiefs, laying down their sticks as a symbol of surrendered arms, declared, "It is peace." Rhodes, riding away, characterized the scene as one of those "which make life worth living."

His life was drawing toward its end. He had still a few years before him, however, and he devoted them with success to the development of the country which bore his name. The railroad was now brought to Bulawayo, and arrangements were made for carrying the line on in sections as far as the south end of Lake Tanganyika, a construction which was part of his pet scheme for connecting the Cape by a British line of communication with Cairo.

Rhodes also concluded arrangements for carrying a telegraphic land line through to Egypt. The mineral development of the country also was fairly started. But the federal union of South Africa, the aim toward which he had always worked as the secure basis of the extension of British rule in the southern half of the continent, was not for him to see. The South African War broke out in 1899. Rhodes took his part at Kimberley in sustaining the hardships of a siege; but his health was broken, and though he lived to see victory practically assured to British arms, peace had not been concluded when, on March 26, 1902, he died at Muizenberg, near Capetown.

His life's work did not end actually with his death. He left behind him a will in which he dedicated his fortunes, as he had dedicated himself, exclusively to the public service. He left the bulk of his vast wealth for the purpose of founding scholarships at Oxford university of the value each of £300 a year, to be held by students from every important British colony, and from every state and territory of the United States of America. The sum so bequeathed was very large; but it was not for the munificence of the legacy that the will was received with acclamation throughout the civilized world: it was for the striking manifestation of faith which it embodied in the principles that make for the enlightenment and peace and union of mankind, and for the fine constancy of Rhodes' conviction that the unity of the British empire, which he had been proud to serve, was among the greatest of organized forces uniting for universal good. The will was drawn up some years before his death. A codicil, signed during the last days of his life, gave evidence of some enlargement of his views as to the association of races necessary in order to secure the peace of the world, and added to the original scheme a certain number of scholarships to be held at the disposal of German students. (See RHODES SCHOLARSHIPS.)

The publication of the will silenced Rhodes' detractors and converted many of his critics. It set a seal which could not be mistaken upon his completed life. The revulsion of sentiment toward him was complete, and his name passed at once in the public estimation to the place which it is probably destined to take in history, as one which his countrymen are proud to count among the great makers of the British empire.

RHODES, JAMES FORD (1848-1927), U.S. historian, was born in Cleveland, O., on May 1, 1848. He studied at New York university, at the University of Chicago, and at the Collège de France in 1867-68, and in 1868 served as occasional Paris correspondent to the *Chicago Times*. He then took a course in metallurgy in the School of Mines, at Berlin, Germany; subsequently he inspected iron and steel works in western Germany and in Great Britain; and in 1870 he joined his father in the iron, steel and coal business in Cleveland, becoming a member of the firm in

1874. He retired from business with an ample fortune in 1885, and after two years devoted to general reading and travel he began his *History of the United States from the Compromise of 1850*, which was published in eight volumes in 1893-1917 (rev. ed. 1920). In 1909 he published a volume of *Historical Essays*; in 1913, *Lectures on the American Civil War*; in 1917, *History of the Civil War*; and in 1922, *The McKinley and Roosevelt Administration 1897-1909*. The merit of his work earned him numerous honorary degrees in England and America. He died in Brookline, Mass., on Jan. 22, 1927.

Lynch, *Some Historical Errors of James Ford Rhodes* (Boston, 1922); A. W. Lowell, "James Ford Rhodes," *Mass. Hist. Soc. Proc.* 1906-07, vol. ix, p. 122-128 (Boston, 1927), and J. T. Morse, "Memoir of James Ford Rhodes," *ib.*, p. 178-192.

RHODES (Rónr), the most easterly island of the Aegean sea, about 10 mi. S. of Cape Alype in Asia Minor (length about 45 mi. from northeast to southwest, greatest breadth 22 mi., area about 545 sq.mi.). It was taken by Italy from the Turks in 1912 and became capital of the administration of Dodecanese (q.v.). Pop. (1936) 61,886 (island), 25,425 (town).

The island is diversified in its surface and is traversed from north to south by an elevated mountain range, the highest point of which is called Atairo (anc. *Atabyris* or *Atabyrium*) (4,560 ft.). It commands a view of the elevated coast of Asia Minor toward the north, and of the archipelago, studded with its numerous islands, on the northwest; on the southwest is seen Mount Ida in Crete, often veiled in clouds, and on the south and southeast the vast expanse of waters which wash the African shore. The rest of the island is occupied in great part by ranges of moderately elevated hills, on which are found extensive woods of ancient pines, planted by the hand of nature. These forests were formerly very thick, but they were subsequently greatly thinned by the Turks, who cut them down and took no care to plant others in their place. Beneath these hills the surface of the island falls lower, and several hills in the form of amphitheatres extend their bases as far as the sea, forming a series of beautiful pictures.

Rhodes has been famed at all times for its delightful climate. The winds blow from the west, often with violence, for nine months in the year; at other times, from the north, moderating the summer heats, except during July and August, when hot winds blow from the mainland.

Rhodes, in addition to its fine climate, is blessed with a fertile soil, and produces a variety of the finest fruits and vegetables. Around the villages are extensive cultivated fields and orchards containing fig, pomegranate and orange trees. On the sloping hills, carob trees and others, both useful and agreeable, still grow abundantly; the vine also holds its place, and produces a species of wine which was highly valued by the ancients, though it seems to have degenerated greatly in modern times; a strong red wine is still exported. The valleys afford rich pastures, and the plains produce every species of grain.

Under Turkish rule Rhodes was a distributing centre for European manufactures to the neighbouring islands and mainland, receiving cattle, foodstuffs and other produce in return. Under Italian rule its commercial position changed and became uncertain. Italian, French and Greek steamships call frequently, and tourists are becoming more numerous.

The only town is the capital, Rhodes, at the northeast extremity, rising from the sea in the form of an amphitheatre, surrounded with walls and towers and defended by a moated castle. These are the work of the Knights of St. John, almost unimpaired. But few traces remain of the splendour of the ancient city, with its regular streets, well-ordered plan and numerous public buildings. The modern city of Rhodes is in general the work of the Knights of St. John and has altogether a mediaeval aspect. The picturesque fortifications also by which the city is surrounded remain almost unaltered as they were in the 15th century. Principal buildings are the church of St. John, now the principal mosque; the hospital, transformed into a museum; the palace of the grand master; and the senate house. The picturesque Street of the Knights is perfectly straight, formed of old houses, on

which remain armorial bearings of members of the order, including those of royal and noble houses of Europe.

Relics of classical antiquity, inscribed altars, bases of statues and architectural fragments are found in courtyards and gardens in the suburbs, the whole of which were within the limits of the ancient city. The foundations also of the moles between the harbours are of Hellenic work, though the superstructures were erected by the Knights.

Rhodes has two harbours. The lesser lies toward the east, and admits cargo steamers, which can also anchor outside in fair weather. The larger is silted and only admits small craft. The two harbours are separated by a mole and at the eastern entrance is the fort of St. Elmo, with a lighthouse.

History.—Archaeological remains of the Late Minoan age show that the early Aegean culture maintained itself in Rhodes comparatively unimpaired until the historic period. Legend also peopled primitive Rhodes with skillful workers in metal, the "Telchines," and with bold navigators, "Children of the Sun." In Homeric legend there was already a Heraclid settlement, and in historic times Rhodes was occupied by a Dorian population, mainly from Argos and subsequent to the "Dorian invasion" of Greece. The three Homeric cities refounded by these settlers—Lindus, Ialysus and Camirus—belonged to the "League of Six Cities," by which Dorian colonists in Asia Minor protected themselves against the neighbouring mainland. The early history of these towns records brisk commercial expansion and active colonization, illustrated by the rich tombs of Camirus. Rhodian colonies extended not only eastward along the southern coast of Asia Minor, but also to the westernmost parts of the Greek world. Examples are Phaselis in Lycia, Soli in Cilicia, Salapia on the east Italian coast, Gela in Sicily, the Lipari Islands, and Rhoda in northeast Spain. In home waters the Rhodians dominated Carpathos and other islands.

The history of Rhodes during the Persian war is quite obscure. In the 5th century B.C. the three cities were enrolled in the Delian league, and were democracies. In 412 the island revolted from Athens and became the headquarters of the Peloponnesian fleet. Four years later the inhabitants concentrated in the newly founded city of Rhodes, laid out on an exceptionally fine site according to a scientific plan by the architect Hippodamus of Miletus. This soon rose to considerable importance and attracted much Aegean and Levantine commerce which had hitherto been in Athenian hands. In the 4th century B.C. political development was arrested by constant struggles between oligarchs and democrats, who in turn brought the city under the control of Sparta (412-395, 391-378), of Athens (395-391, 378-357), and of the Carian dynasty of Mausolus (357-340). About 340 it was conquered for the Persian king by his Rhodian admiral, Mentor. In 332 it submitted to Alexander the Great, but on his death, the people expelled the Macedonian garrison, and henceforth not only maintained their independence but acquired great political influence. The expansion of Levantine trade in the Hellenistic age brought especial profit to Rhodes, whose standard of coinage and code of maritime law became widely accepted in the Mediterranean. Under modified democracy, in which the six *nephrates* found a powerful executive, the city long enjoyed a good administration. In foreign politics it prudently avoided the ambitious schemes of Hellenistic monarchs, but gained prestige by energetic interference against all who threatened the balance of power or the security of the seas. Chief incidents were a memorable siege by Demetrius Poliorcetes in 304, who sought in vain to force the city into active alliance with King Antigonus; a severe earthquake in 227, the damages of which all Hellenistic states contributed to repair, because they could not afford to see the island ruined; some vigorous campaigns against Byzantine, Pergamene and Pontic kings, who threatened the Black sea trade route (220 sq.), and against the pirates of Crete. In accordance with their settled policy the Rhodians supported the Romans when these made war upon Philip V of Macedonia and Antiochus III of Syria on behalf of the minor Greek states. During the Third Macedonian War a false step deprived them of possessions in Lycia, and partially diverted their trade to Delos (167). Nevertheless, during the two Mithridatic wars they remained loyal to Rome, and in 88 successfully stood a siege. The

Rhodian navy did further good service for Pompey in his campaigns against the pirates and against Julius Caesar. But in 43 B.C. Cassius besieged and ruthlessly plundered the people for refusing to submit to his exactions and, though Rhodes continued a free town for another century, its commercial prosperity was crippled, and extensive earthquakes after A.D. 155 completed its ruin.

In the days of its greatest power Rhodes became famous as a centre of pictorial and plastic art; it had a school of eclectic oratory whose chief representative was Apollonius Molon, the teacher of Cicero; it was the birthplace of the Stoic philosopher Panaetius; the home of the poet Apollonius Rhodius and the historian Posidonius. Protagoras embellished the city with his paintings, and Chares of Lindus with the celebrated colossal statue of the sun-god, which was 105 ft. high. The colossus stood for 56 years, until an earthquake prostrated it in 224 B.C. Its enormous fragments continued to excite wonder in the time of Pliny, and were not removed until A.D. 656, when Rhodes was conquered by the Saracens, who sold the remains for old metal to a dealer, who employed 900 camels to carry them away. The notion that the colossus once stood astride over the entrance to the harbour is a mediaeval fiction. During the later Roman empire Rhodes was the capital of the "province of the islands." Its history under the Byzantine rule is uneventful but for some temporary occupations by the Saracens (653-658, 717-718), and the gradual encroachment of Venetian traders after 1082. In the 13th century the island stood as a rule under the control of Italian adventurers, who were, however, at times compelled to acknowledge the overlordship of the emperors of Nicaea, and failed to protect it against the depredations of Turkish corsairs. In 1309 it was conquered by the Knights Hospitallers of St. John of Jerusalem at the instigation of the pope and the Genoese, and converted into a great fortress for the protection of the southern seas against the Turks. Under their mild and just rule both the native Greeks and the Italian residents were able to carry on a brisk trade. But the piratical acts of these traders, in which the knights themselves sometimes joined, and the strategic position of the island between Constantinople and the Levant, necessitated its reduction by the Ottoman sultans. A siege in 1480 by Mohammed II led to the repulse of the Turks with severe losses; after a second investment, during which Sultan Suleiman I is said to have lost 90,000 men out of a force of 200,000, the knights evacuated Rhodes under an honourable capitulation (1522). The population henceforth dwindled in consequence of pestilence and emigration, and although the island recovered somewhat in the 18th century under a comparatively lenient rule, it was brought to a very low ebb owing to the severity of its governor during the Greek revolution. The sites of Lindus, Ialysus and Camirus, which in the most ancient times were the principal towns of the island, are clearly marked, and the first of the three is still occupied by a small town with a mediaeval castle, both of them dating from the time of the knights, though the castle occupies the site of the ancient acropolis, of which considerable remains are still visible. There are no ruins of any importance on the site of either Ialysus or Camirus, but excavations at both places have produced valuable and interesting results in the way of ancient vases and other antiquities, which are now in the British Museum and in the local collection at Rhodes. In mediaeval times its pottery, a lustre ware at first initiated from Persian, developed into an independent style of fine colouring and rich variety of design. After the Italian occupation in 1912 a considerable modern quarter on European lines grew up west of the city of the knights; carriage roads were constructed and the harbours improved.

RHODESIA. The name covers the territory extending from the Transvaal border northward to the boundaries of the Belgian

Congo and of Tanganyika Territory, and from Portuguese East Africa, Nyasaland and the Tanganyika Territory on the east to Belgian Congo, Portuguese West Africa and Bechuanaland on the west. The region north of the Zambezi is Northern Rhodesia, a British colony; south of the Zambezi lies Southern Rhodesia, a British self-governing colony, including the areas of Matabeleland and Mashonaland. In this article Northern Rhodesia and Southern Rhodesia are treated separately from the geographical and administrative point of view. The historical section deals with both areas.

NORTHERN RHODESIA

Northern Rhodesia until 1911 consisted of two distinct provinces, North-Western Rhodesia and North-Eastern Rhodesia. The combined area is 290,320 sq. mi. The country includes much of the watershed of the Zambezi and the Congo. It is bounded on the north and northeast by the Belgian Congo, Lake Tanganyika and Tanganyika Territory, on the east and southeast by Nyasaland and Portuguese East Africa, on the southeast and south by Southern Rhodesia, on the west by Angola, and on the northwest and north by the Belgian Congo.

Topography.—Much of the country consists of high plateau, the Congo-Zambezi watershed rising, in places, to 5,000 ft. The highest land forms a ridge known as the Muchinga mountains, running northeast to southwest, to the southeast of Lake Bangweulu. Still higher land occurs in the Tanganyika district near the southern end of Lake Tanganyika. In the valleys of the Lower Zambezi, the Luangwa and the Kafue, the altitude falls below 3,000 ft. Within the territory lie Lake Bangweulu (*q.v.*) and half of Lake Mweru (*q.v.*).

Flora and Fauna.—A large part of the region is covered with tropical or subtropical savanna. The tall tropical forests of the west African type are poorly represented, and occur chiefly near Lake Tanganyika. The country is fairly well provided with big game. Elephants are to be found in nearly all localities; hippopotami occur in all the larger rivers; the black rhinoceros and giraffe, and large herds of eland, roan antelope, hartebeeste and zebra are to be seen. A list of all the animals would be a long one, but it would include sable antelope, waterbuck, lechwe, sitatunga, impala, reed buck, bush buck, oribi, duiker, etc. Lions are not uncommon. Game reserves have been established, and some of the rarer animals are protected.

Government.—Northern Rhodesia is administered by a governor and commander in chief, assisted by an executive council of five official members. For its constitution see the section *Rhodesian History*. The legislative council has 16 members, with 7 elected members. The franchise is based on property qualifications, limiting the vote to about one-third of the Europeans. A voter must also be a British subject. Natives are not considered British subjects. The capital is Lusaka.

Population.—The European population (1942 est.) was 15,188, and the native population 1,366,641. There are 50 to 60 native tribes, among the chief of which, numerically, are the Awemba, Achewa, Angoni, Asenga, Awisa, Alala, Batoka, Baroti, Baila, Baleya, Bakaoenge, etc. It was estimated in 1938 that 101,776 natives were employed in the colony and 45,210 outside.

Communications.—The country is traversed by a railroad linking Southern Rhodesia and South Africa, and running through Livingstone and Broken Hill to Elisabethville and the Belgian Congo (507 mi.). A few branch lines also exist. Parts of the Zambezi, Kafue and Luapula rivers are navigable. A monthly steamer service runs on Lake Tanganyika from Mpulungu. Arterial roads, including the Great North road, 1,110 mi. from Livingstone to Abercorn, the Congo Border road, and the Great East road from Lusaka to Nyasaland (392 mi.) measure 2,160 mi. Other roads are about 5,000 mi. in extent. Luangwa river bridge (1934) and the Victoria Falls bridge are important links.

Occupations.—Economic development by Europeans is largely dependent on transport facilities. In 1937 some 3,060,000 ac. were occupied by Europeans. Within 30 mi. of the railway in the Batoka and Luangwa districts, farms have been taken up, and maize is the chief crop, though tobacco, cotton, fibre, etc., are also grown.

Native agriculture is largely confined to foodstuffs. Cattle growing appears to be successful near the Kafue river and in the Kalomo area, although limited elsewhere by the prevalent tsetse fly. Tobacco cultivation is being developed about Fort Jameson, and its extension will be helped by railway development in Nyasaland. A few farms have also been alienated in the Tanganyika district, where cattle thrive, but there is, as yet, no outlet for the produce of this area, until development in Tanganyika Territory provides a way from the lake to Dar-es-Salaam. Forests cover approximately 176,000 sq. mi., of which 54% are state-owned. Mining is carried on at Broken Hill, where lead and zinc deposits occur, and at the Bwana M'kuba copper mine. Metals formed 97% (copper 88%) of the total value of the exports. Imports were £5,114,428 and exports £10,130,941 in 1938. The United Kingdom took 40% of the exports and Germany 32%. The British empire supplied 78% of the imports. There are no large industries.

Education and Health.—In 1936 there were 127,000 students enrolled at 1,460 recognized schools. Among these were 20 schools for Europeans with an enrolment of 1,914 (1940) and government schools for natives at Mongu, Kasana, Ndola, Lusaka and Abercorn. Many of the numerous mission schools receive government grants-in-aid. There are 73 native schools in Barotseland. In the Lusaka area Afrikaners is taught. Malaria, blackwater fever and dysentery are not uncommon, and sleeping sickness occurs in the Luangwa valley.

Finances.—Revenue (1942) was £2,657,303, chiefly from income and native taxes (poll tax from 7s.6d. to 15s.) and customs. Expenditures were £1,918,536.

Customs.—The country is divided into two parts. (1) The "Congo basin" comprises that part of North-Eastern Rhodesia lying to the northwest of the Muchinga mountains in the conventional zone of the Congo. No preference may be given to the imported products of any country. The duty on imports does not exceed 10% ad valorem. (2) The "Zambezi basin" is a party to the South African customs agreement. South African produce, except spirits and manufactured tobacco, is admitted free of duty. Goods may be imported in bond through South Africa or Southern Rhodesia, which allows British goods to benefit by lower import duties than those entering the Union of South Africa.

See the annual reports on *Northern Rhodesia* issued by the British colonial office.

SOUTHERN RHODESIA

Southern Rhodesia, separated from Northern Rhodesia by the Zambezi river, is bounded on the northeast and east by Portuguese East Africa, on the south by the Transvaal and on the southwest and west by the Bechuanaland Protectorate. It consists of Matabeleland and Mashonaland, and covers 150,333 sq. mi. The country lies between 15° 36' and 22° 25' S. and 25° 14' and 33° 4' E.

Physical Features.—Southern Rhodesia forms part of the great South African plateau. The highest part runs from southwest to northeast and forms a broad watershed between the basin of the Zambezi and the basins of the Limpopo and Sabi. It is along this central axis that the railway runs from Plumtree through Bulawayo to Salisbury. In this central area the elevation ranges from above 4,000 ft. to over 5,000 ft. On each side the elevation decreases, falling to below 2,000 ft. about the Zambezi, and to below 1,000 ft. in the southeast. About 24% of the total area lies above 4,000 ft. The surface consists for the most part of gently undulating plains, diversified by steep-sided hill ranges and isolated kopjes. The highest point occurs 48 mi. N. of Umtali in Inyangeni mountain, 8,250 ft. There a definite mountain range runs north and south and forms the eastern border of the country.

Climate.—On the whole the considerable altitude partly compensates for the low latitude. The days are hot throughout the year, the nights frequently cool, and frost is liable to occur during June, July and August. From the middle of August the temperature increases to its maximum in October, when the mean maximum is 85.2° F., taking the country as a whole. Rains and cloud usually appear about October and bring a little coolness. Sometimes the rains are late and the high temperatures continue to be rather trying during November and December. The thermometer

may rise to over 100° F. even on the high veld. Humidity averages 65% over the year, falling to 48% in October and remaining at about 75% from December to March. The rainy season may be said to last from October to March. The annual average rainfall is 28 in.

Vegetation.—About two-thirds of the country is covered with trees and shrubs. There are comparatively few open stretches. The prevailing plant association is savanna, forming parklike territory. At favourable spots on the mountainous eastern border, close evergreen forests occur in patches, some of the trees attaining a height of 200 ft. On the upper slopes *Lussonia umbellifera* and *Eugenia* species are dominant, and there they grow to heights up to 80 ft. The so-called Rhodesian teak (native Igusi: *Baikiaea plurijuga*) is about 50% harder than real teak. From the bark of the baobab the natives obtain a fine fibre which they use for making nets.

Fauna. (See also SOUTH AFRICA, UNION OF.)—The country is rich in antelopes, the most common species being the duiker, the stembok and the reitbok. Other herbivorous animals are the buffalo, giraffe, zebra, elephant, rhinoceros and hippopotamus. The carnivora include the lion, leopard, cheetah and various wild cats. Crocodiles occur in the rivers. Beetles, butterflies and moths abound. White ants (termites) and locusts are troublesome. Among the largest of the birds are ostriches, secretary birds, pawns, korhaans, cranes, storks, vultures and eagles. Guinea fowl, partridge, duck, geese and teal are shot. Good shooting is to be had, but the following are royal game, and so are protected: eland, elephant, giraffe, gemsbok, hippopotamus, inyalu, ostrich, rhinoceros, springbuck and zebra.

Population.—In 1941 the population consisted of 68,954 Europeans, 1,399,000 natives, and about 6,521 Asiatic and coloured people. The natives include Amandabele, Amatshangana, Basuto and numerous tribes who are often grouped together as "Mashona." Ninety-three per cent of the white population speaks English. A certain amount of Afrikaners, however, is spoken in the country districts.

Towns and Communications.—Salisbury and Bulawayo are described in separate articles. Umtali, which is the centre of a gold-mining area, has a European population of 2,646 (1941). Other towns are Gwelo, Enkeldoorn, Melsetter and Hartley.

The railways, with a mileage of 2,709, are operated by a railway commission acting for the two Rhodesias and Bechuanaland (Railway act, 1926). The colony is well served, and is connected with Beira, the nearest port, the Belgian Congo and the Union of South Africa. There is through communication by the Rhodesian system from Capetown to the Congo border and, via Bulawayo and Salisbury, to Beira on the Indian ocean. The lines, as far as possible, follow the watersheds. The standard gauge is 3 ft. 6 in. Roads total about 9,000 mi., much of which is all-weather road.

Agriculture and Pastoralism.—Farming exists in several forms, from ranching to tobacco growing. Mixed farming is becoming more common, and dairying is practised on the smaller farms near the towns and mines. Maize is the chief crop. The acreage under crops (1942) was: maize 231,887; tobacco 79,109; legumes and fodders 111,083. Irrigation is still in its infancy. Citrus orchards are expanding, 147,535 cases of fruit having been sold in 1942. Ranching is favoured by the climate, which allows the cattle to run out on the veld throughout the winter. In 1942 there were 2,647,154 cattle, more than half being owned by Europeans, generally in herds of from 600 to 1,000. They are grass-fattened for market, or are sent on to agricultural farms for the final preparation.

Mining.—Minerals now being mined are gold, chrome, lead, asbestos, mica, tungsten, coal, silver, etc. In 1941 the output of gold was valued at £6,639,714. The total output of minerals was valued at £8,899,050.

Industry and Commerce.—The gross output of industries in 1942 was valued at £11,761,000. Exports (1940) were £13,399,357, principally minerals and tobacco (£2,090,400). Imports were £9,550,701, chiefly textiles, iron and steel goods, and other manufactured goods. Exports to the United Kingdom were £10,228,832

(1940); to the United States, £953,800.

Government.—For the constitution under the letters patent of 1923 see under *Rhodesian History*.

Education.—There were 59 primary and 14 secondary schools for Europeans in 1942, and in addition a large number of state-aided farm schools. There were (1941) 1,457 schools for native children with an enrolment of 113,902, and 13 schools for coloured children. (P. W. I.)

RHODESIAN HISTORY

The Ancient Gold Field.—The regions of south-central Africa, now known as Rhodesia (North and South), include what was probably the greatest gold field of the ancient world. The remains of the mines, sunk to a vertical depth of sometimes 150 ft. in gold-bearing rock, are found in an area 500 mi. long by 400 mi. broad; and it is estimated by the mining engineers of today that, allowing for imperfect methods of extraction, gold of a value equivalent to at least £75,000,000 must have been won from these prehistoric workings. Even so, enough was left to make this very ancient gold field one of the chief resources of the youngest self-governing colony of the British empire; and eleven-twelfths of the 129,000 claims registered in 1910 were pegged out on the site of mines of varying antiquity. In this gold-bearing area numbers of non-Indigenous plants, fruits and trees of Indian habitat are found, and there may have been a Hindu colonization and supremacy there as there was in Java in the centuries preceding the Mohammedan conquest of that island. Another solution is that the gold area was mined by the Sabaeo-Phoenicians of Yemen with Indian labour, and that while the Ophir of King Solomon was the southwest corner of Arabia, most of the gold of this Ophir (and of the Graeco-Roman world) came from southeast Africa. A glance at the map will show how easily the Sabaeans could reach by land and sea the east coast of Africa. In addition to the ancient gold workings there are two other classes of remains which reveal something of the early history of the country. As many as 426 Bushman rock paintings have been found in caves. They are generally hunting scenes and animals, but nine of them depict the Victoria falls. Until the discovery at Broken Hill in 1920 of the skull of what is thought to be an extinct species of man (*Homo rhodesiensis*), comparable to the Neanderthal species of Europe which perished at the close of the last glacial period, the Bushmen were taken to be the earliest inhabitants. This discovery (the actual skull is in the British museum; a plaster cast of it is in the museum at Bulawayo), in conjunction with the prevalence of Palaeolithic hand-axes and other implements similar to those of the Neanderthal men in Europe, suggests that the country was peopled by this extinct species of man thousands of years before the era of the Bushmen (7000 B.C.). The other class of remains consists of the ruined stone buildings, at least 400 in number, of which the Great Zimbabwe is the most remarkable. Some hold that, while these ruins are of varying periods, ancient, mediaeval and comparatively recent, the oldest must be associated with the Asiatic rock-miners. Others believe that they are exclusively mediaeval, or post-mediaeval.

Monomotapa.—The gold area of south-central Africa emerges as the Bantu kingdom of Monomotapa with the capture of the east coast ports from the Arabs by the Portuguese in A.D. 1500–20. At that time the fertile and temperate uplands which lay inland behind the fever-stricken coast lands were peopled by industrial Bantu, who, migrating from the north many centuries before, had perhaps mingled with and absorbed a decadent remnant of the Sabaeans, or Indian, or Persian, gold-mining population of the Graeco-Roman era. The ancient rock-mining had been long abandoned, and the gold was won by river sand washing and such rude methods of quartz crushing as were known to the Bantu. The paramount chief was styled grandiloquently the Monomotapa, or Lord of All; and the territory of the dynasty is shown on the 16th- and 17th-century maps as Monomotape Imperium. Although the Portuguese desired from the first to obtain possession of the gold area, they made no permanent settlements in the interior except where the waterway of the Zam-

bezi gave easy communication from the coast. The missionaries, however, whose reports on the Monomotapa, or Kafir, mission are preserved in the archives of the Propaganda and in the Vatican library at Rome, penetrated to the great chief's "court" and converted him to Christianity. As the result of the relations thus established, the Monomotapa of the day granted, by treaty in 1629, the "gold mines" to the king of Portugal. This acquisition failed to yield even a moderate revenue at the time, but 250 years later it brought the Portuguese a very substantial advantage. For it was this treaty, with the cross of the Bantu chief affixed to the words "Manuza, emperor of Monomotapa," that enabled Portugal to make good her claim to Delagoa bay in the MacMahon arbitration of 1875.

Matabele Conquest.—But possession of the country had passed from the industrial to the military Bantu. In 1837 Moselekate, chief of the Amandabele (corrupted to Matabele), a military tribe akin to the Zulus, having failed to kill the white men north of the Orange river, was himself driven across the Limpopo by the Boers. There he almost exterminated the light-skinned, industrial Ma-Kalanga population, and established himself and his tribe in the best of their lands—thereafter Matabeleland. Three years later the Mashonas were reduced to slavery and vassalage. They also, like the Ma-Kalanga, were industrial Bantu, living in open villages with land under permanent cultivation, and practising the arts of metal-working, pottery and weaving; and the supremacy of Moselekate and his successor Lobengula was maintained over them by the dispatch of the Matabele warriors once a year to work indiscriminate murder and robbery throughout their villages.

THE FOUNDING OF RHODESIA

Cecil Rhodes.—The first conception of Rhodesia came to Cecil Rhodes at Oxford in 1878. Sir Sidney Shippard, who afterward succeeded him as commissioner in Bechuanaland, has recalled how, walking in Christchurch meadows, Rhodes and he "discussed and sketched out the whole plan of British advance in South and Central Africa." In 1888, with the prestige of an unexampled financial achievement, vast wealth, and an idealistic temperament that refused to recognize as permanent the hostility either of men or circumstances, Rhodes was ready to give effect in Africa to the thoughts which had first germinated in his mind ten years before at Oxford. There was no time to lose. In 1887 Portugal joined (on paper) Mozambique to Angola by claiming the whole of the interior between them—a claim to which Germany and France assented, but which the British government at once repudiated. In the same year it was known at the Cape that the Boers were preparing to make a settlement in Mashonaland. This news spurred to action Rhodes, who was then deputy resident commissioner in Bechuanaland. On his motion, but with the sanction of the high commissioner, J. S. Moffat, the British resident at Bulawayo, made on Feb. 12, 1888, a treaty under which Lobengula bound himself not to enter into correspondence with any foreign power without the knowledge and consent of the high commissioner. On Oct. 30, again with the high commissioner's sanction, Rochford Maguire and two others obtained from Lobengula, in return for a monthly payment of £100 and a supply of rifles and ammunition, a concession of the right to search for and work minerals within his territory. This concession was then transferred to an association which Rhodes had formed, in consideration of the association's undertaking to provide the capital necessary to put it into effect and to share the net receipts with the concessionaires. On April 30, 1889, the association's proposals for the formation of a company to develop the Bechuanaland Protectorate were submitted to the British government. The objects of the proposed company were: (1) to extend northward the railway and telegraph systems; (2) to encourage emigration and colonization; (3) to promote trade and commerce; and (4) to develop and work mineral and other concessions under the management of one powerful organization.

British South Africa Company.—The company received its charter on Oct. 29, 1889. Rhodes, as general manager in South Africa, arranged to carry the railway northward from Kimberley,

¹The word "ophir," like "harshish," is a generic term indicating any conspicuous source of natural products or merchandise.

and enrolled a force of 500 police to protect the settlers, who were to be established on the Mashonaland plateau; and nine months later the company took possession of what an agent of the French government termed not ineptly "the pick of Central Africa on both sides of the Zambezi." The pioneer expedition of 200 European settlers, 150 African labourers and the police broke camp on the Macoutise river on June 28, 1890; and, commanded by General Pennefather and guided by Selous, reached Fort Salisbury, a distance of 400 mi. through virgin country, on Sept. 12. The cost of the expedition, exclusive of grants of land and mineral rights to the pioneers, was £89,285 ros.; and the occupation was effected "without the loss of a single life, and without the necessity of firing a shot." The company's police, however, came into collision almost at once with the Portuguese authorities on the eastern border at Massikessi. Further conflict was avoided by the *modus vivendi* of Nov. 11, and the terms of this arrangement were embodied, together with the settlement of the limits of the Portuguese territories east and west, in the Anglo-Portuguese convention of June 11, 1891. Under this instrument, which governs the relations of Rhodesia to Mozambique, Portugal undertook to construct, or allow the construction of, a railway from Beira, the natural port of the interior, to the Rhodesian frontier; to limit the duties upon goods in transit to and from British territory through Mozambique to 3%; and to recognize the Zambezi and Shire rivers as international waterways.

The early years of Rhodesia—the name was given to the company's territories by proclamation of May 3, 1895—were arduous and eventful. The 1,500 settlers, Rhodes told the shareholders at their annual meeting on Nov. 29, 1892, "went to work to find their reefs, but they were removed 1,700 miles from the coast, and their food cost them £70 a ton." To provide means of transport and communication was the first duty of the company, and Rhodes set about it at once. The work was interrupted three times; by the Matabele War in 1893, by the Jameson raid and the subsequent native insurrection in 1896, and by the great South African War of 1899–1902. The most serious of these interruptions was the second. On Jan. 6, 1896, Rhodes resigned his premiership of the Cape Colony on account of his complicity in the raid, and went to London to see the colonial secretary (Joseph Chamberlain) and do what he could for Jameson and the other raiders, who were being sent home for trial. While there the news of the native insurrection reached him, and he hastened to Rhodesia, travelling by the Suez canal to Beira. By the help of the railway then being made he got to Salisbury in time to join the column which set out on April 18 for the relief of Bulawayo, where the settlers had just gone into laager with 10,000 Matabele rebels on the hills around. It was then that, at the risk of his life, in the Matopo hills he won the Matabele indunas to a prompt submission, and drove the railway up from Palapye 229 mi. to Bulawayo, in the amazingly short time of five months. The settlers increased in numbers, industries were established, public offices, law courts, churches, schools and hospitals were built, the administration became more efficient, and by 1905 Rhodesia had "turned the corner." In that year, with a gold export of £1,500,000, it took its place among the gold-producing countries of the empire; and in that year the first train steamed slowly across the majestic span of the Victoria Falls bridge.

Development of Rhodesia.—During the remaining 18 years of the company's rule (1905–23), the resources of the colony were steadily developed, while, with the increase of European population, the elected minority in the legislative council, introduced in 1899, grew into a majority of 12 to 6 in 1914. There was no rapid increase of the European population. Between 1904 and 1911 it rose from 12,506 to 23,606; and at the close of the company's rule it was returned, by the census of 1921, as 33,260. There was a reason for its relatively slow growth. In Rhodesia, as in South Africa, manual labour was provided, broadly speaking, by the 500,000 native Africans already in the country, and there was, therefore, no room for British emigrants of the wage-earning class. Hence, the proportion of well-educated and well-bred immi-

grants was unusually large. The European settlers are 90% British. Unlike the Union of South Africa, Rhodesia is free from the bilingual incubus, with its double notices and mediums of instruction, and its frequent incitements to social and political dissension. Industry, on the other hand, showed a high rate of progress. Rhodes recognized from the first that the mineral production must be supplemented by the more permanent resources of agriculture and stock raising. And after his death (1902) the company, so soon as the economic disturbances caused by the South African War had passed, endeavoured to administer the colony in this and other respects on the lines he had laid down. In 1907 Jameson, then prime minister of Cape Colony, and other directors of the company, visited Rhodesia to investigate the grievances of the settlers and devise measures for increasing production. As the result, the acquisition of agricultural land was made easier and less costly, and government advice and assistance was given to farmers, cattle ranchers and planters. In particular the cultivation of tobacco was promoted, and in 1911 the value of the export was £34,810. At the same time the development of the mineral wealth of the country continued, and the gold export of 1909, £2,623,708 in value, placed the colony fourth among the gold-producing countries of the empire. During World War I, although Rhodesia contributed its full quota to the British armies, the production of copper and other base metals, as well as that of maize and chilled meat, was actually increased.

End of the Company's Rule.—With the expiry of the 25 years' term of the company's charter on Oct. 29, 1914, among other alternative courses, three especially claimed the attention of the settlers. When, in 1908–09, the national convention met to frame the Union of South Africa, Rhodesian delegates followed the deliberations in the interests of the country, and provision was made in the Imperial Act of 1909 for its subsequent, and voluntary, entry into the Union. That course was open. A second was to support a renewal of the charter, and a third to press for self-government. The development of events under the predominantly Dutch ministry of Gen. Louis Botha made Rhodesians hesitate to join the Union, and in 1913 a movement for responsible government took shape. The process of taking over the administration from the company, however, presented so many difficulties that 11 out of the 12 members elected to the legislative council in March 1914 were pledged to maintain the company's rule for the time being. A month later the council defined its policy. It affirmed the right of the settlers to self-government, and instituted the proceedings necessary to ascertain what sources of revenue the company would hand over to the administration that succeeded it. In these circumstances the British government renewed the charter for ten years, with the proviso—in which the company concurred—that responsible government should be granted before the term expired, if and when the settlers could show that they were capable of administering the colony. The directors of the company were ready to surrender their powers, but they had to consider the interests of the shareholders. One difficult problem was the ownership of the unalienated land. The company's expenditure on administration had exceeded greatly the revenue collected. The directors looked to the sale of these lands to make good the loss under this head, and with this purpose in view they had declared formally in 1913 that the unalienated land, as well as its mineral rights and railway interests, was the property of the company. The legislative council, on the other hand, maintained that the land, being vested in the company merely as "an administrative and public asset," would pass, on the expiry of the company's administrative powers, to the colony. A privy council judgment (1918) decided that while the unalienated land was crown property, the company was entitled to dispose of it until its administrative losses had been recovered. A royal commission—the Cave commission—assessed the amount thus due to the company at £4,435,000 (Jan. 1921). On the recommendation of the Buxton committee, and in response to a petition from those who were in favour of entering the Union, both a draft constitution conferring responsible government and the specific terms offered by Gen. Jan Christian Smuts for admission to the Union were placed before the Rhodesian electors in 1922. The

question was decided on Oct. 27 by a referendum in which 5,989 electors voted for entry into the Union and 8,774 for responsible government. This majority—all the more significant in view of the generosity of the terms offered by the Union—led to the intervention of the British government. The company agreed to accept in satisfaction of its administrative claims in respect of both Northern and Southern Rhodesia the sum of £3,750,000 in lieu of the royal commission assessment of £4,435,000, but it retained its mineral rights and obtained an assurance that these and its interests in the railways would be respected by the governments which replaced it. The £3,750,000 was paid in cash on Oct. 31, 1923. Of this sum, £1,750,000 was the gift of Great Britain, and the remaining £2,000,000, raised by loan, was paid by Southern Rhodesia, which at the same time repaid the British government a sum of £300,000, advanced to the company for administrative losses incurred after March 31, 1918, the end of the period covered by the award of the royal commission. In the meantime, on Sept. 12, 1923, the 32nd anniversary of the arrival of the pioneer force at Fort Salisbury, Southern Rhodesia, was formally annexed to the British crown. (W. B. W.)

UNDER RESPONSIBLE GOVERNMENT

Southern Rhodesia.—Under the constitution granted by letters patent on Oct. 1, 1923, legislation affecting the African population, the unalienated land, the railways and the mineral rights of the company is subject to disallowance by the crown, but in other respects Southern Rhodesia was endowed with the institutions of a self-governing overseas British state. Legislative power is vested in the king, represented by the governor, an executive council composed of the ministry under the presidency of the governor and responsible to the legislative assembly of 30 members, elected in 12 electoral districts. The first general election was held on April 29, 1924, and the first ministry was then formed by Sir Charles Coghlan. The franchise is extended to all British subjects, including natives, over 21 years of age and possessing £100 of property. One of the first concerns of the colonial government was to augment the European element. In the first nine months of 1927, 3,574 immigrants were received. In the following year the European population, which was returned in the census of May 4, 1926, as 39,174, was estimated to be 50,000.

Northern Rhodesia.—This vast territory, twice as large as Southern Rhodesia, was divided into North-Western and North-Eastern Rhodesia until 1911 when the territory was administered as Northern Rhodesia. At the time of the amalgamation its European population was 1,434, and the annual value of its imports and exports, respectively, £127,664 and £128,458. In 1924 the territory was taken over by the British government and administered under the constitution granted by order-in-council of Feb. 20, 1924. The first governor, H. J. Stanley, took office on April 1, 1924. The natives are left as much as possible to the authority of the chiefs, but there is a European magistrate in each of the six provinces into which the colony is divided. Barotseland is a "native reserve," ruled by the paramount chief and the council of lesser chiefs common to the Bantu peoples. As, under the terms of transfer, the company retains the mineral royalties and 50% of the land revenues, the crown administration is placed in a disadvantageous financial position.

The conditions of North-Western and North-Eastern Rhodesia differ materially; 85% of the Europeans and the seat of government are in North-Western Rhodesia, in proximity to the railway. The European population of North-Eastern Rhodesia, on the other hand, is almost limited to the (approximately) 500 settlers engaged in the tobacco plantations. The separation of the two areas has been emphasized by an almost complete lack of communications—a factor which must continue to operate until the new east-to-west road from Fort Jameson to the Cape to Cairo railway has been made. Although the climatic and other conditions of the territory are not unsuitable for European colonization, the company made little effort to introduce settlers and, broadly speaking, under its rule the development of Northern Rhodesia was subordinated to the interests of Southern Rhodesia.

Amalgamation of the Territories.—The appointment of

the Hilton Young commission in 1927 brought into prominence the question of amalgamation of the two Rhodesias, which had been raised in 1914. Under the terms of reference Northern Rhodesia was classed officially as a member of the east coast group of British colonies. The commission did not find itself in complete agreement as to the disposal of the colony, but in its report (Command 3234), published in Feb. 1929, it advised that "in the present state of communications the main interests of Nyasaland and Northern Rhodesia, economic and political, lie not in association with the Eastern African territories but rather with one another and with the self-governing colony of Southern Rhodesia."

It recommended, however, that the co-operation which already existed between the northern territories and Nyasaland, Northern Rhodesia and Zanzibar should be continued and that through conferences links should be retained.

Although sentiment for amalgamation of the Rhodesias and Nyasaland has continued, especially in Southern Rhodesia, the secretary of state for the colonies, Col. Oliver Stanley, announced in the British house of commons, Oct. 18, 1944, that, after taking into consideration all views, "the amalgamation of the territories cannot be regarded as practicable." It was also announced that a central African council for the two Rhodesias and Nyasaland would be set up.

RHODES SCHOLARSHIPS. Cecil Rhodes provided by his will for the maintenance at Oxford university of about 200 scholars for a term of three years each. The value of each scholarship is now £400 a year. Thirty-four scholars come each year from the British empire, distributed substantially as follows: one scholar is elected annually from each province or state of Canada, Australia, New Zealand and South Africa; from four specified schools in the Cape Province of South Africa and from the colonies of Newfoundland, Jamaica and Bermuda. Rhodesia elects three scholars each year, and Malta one every third year. Thirty-two scholars are elected annually from among the 48 states of the United States.

Five annual scholarships were allotted to Germany, but these were annulled by parliament in 1916.

In his will Rhodes mentions the objects he had in view in founding the different scholarships:

1. *Colonial.*—"I consider that the education of young colonists at one of the universities in the United Kingdom is of great advantage to them for giving breadth to their views, for their instruction in life and manners, and for instilling into their minds the advantage to the colonies as well as to the United Kingdom of the retention of the unity of the empire."

2. *American.*—"I also desire to encourage and foster an appreciation of the advantages which I implicitly believe will result from the union of the English-speaking people throughout the world, and to encourage in the students for the United States of North America who will be selected for the American scholarships the desire to do for their own country what I have done for mine, which may have seemed but at the time I wrote with other views in my mind, and the fact that it is made an obligation."

He declares that the purpose of the scholarships is to "enable the students to be selected for the scholarships who shall be elected to the scholarships of the United Kingdom to be elected to the election of a student to a scholarship regard shall be had to (1)

his literary and scholastic attainments; (2) his fondness for and success in mainly outdoor sports such as cricket, football and the like; (3) his qualities of manhood, truth, courage, devotion to duty, sympathy for and protection of the weak, kindness, unselfishness and fellowship; and (4) his exhibition during school days of moral force of character and of instincts to lead and to take an interest in his schoolmates, for those latter attributes will be likely in after life to guide him to esteem the performance of public duties as his highest aim."

Method of Selection.—Subject to ratification by the trustees, the nomination of scholars is in the hands of local committees, which are appointed by the trustees, and on which ex-Rhodes scholars sit. Candidates must be citizens of the country, dominion or colony which they are to represent, with at least five years' domicile, and unmarried; and they must have passed their 19th and not have passed their 25th birthday by Oct. 1 of the year for which they are elected. Candidates are judged on their records and after a personal interview with the selection committee. But, except in certain exceptional cases, candidates are obliged to have attended a recognized degree-granting college or university for two years at least. At Oxford the scholars are distributed, as Rhodes desired, among all the colleges of the university, as far as possible in accordance with their own wishes, but acceptance of any scholar is determined by the colleges themselves. No college undertakes to accept more than between two and five Rhodes scholars in any one year. (P. K.)

RHODIUM, a metal always found in platinum ores but never in large quantities, was first discovered by Wollaston and announced by him in the memoir disclosing the discovery of palladium (*Phil. Trans.*, 1804). (Symbol Rh, atomic number 45, atomic weight 102.9.) Its name is due to the rose-red colour of its salts (*pédon*, a rose).

If a platinum ore is treated with aqua regia, most of the osmium, iridium and ruthenium is left undissolved (some rhodium is also left if much is present). The platinum can be nearly all removed from the solution by precipitation with ammonium chloride and, if the acid solution is treated with scrap iron ("footed"), the remaining metals are deposited. If this precipitate is fused with potassium bisulphate the rhodium is all converted into potassium rhodium sulphate, which on extraction with water and recrystallization gives the pure salt. Another method is to heat the above metallic precipitate with common salt in a stream of chlorine, when the double sodium rhodium chloride, Na_2RhCl_6 , is formed; this is extracted with water and crystallizes with 12 molecules of water in dark red crystals appearing almost black by transmitted light. For other and more complicated methods of extraction, see Claus, *T. Prakt. Chem.*, (1843-45); Gibbs, *ibid.* (1861) p. 65, (1865) p. 10.

Rhodium in the massive state is a slightly bluish-white metal having a specific gravity of about 12.1. It fuses at about 1940° C. and volatilizes at a somewhat higher temperature. It oxidizes superficially when heated in the air, becoming coated with a film of a blue oxide. It is practically insoluble in either hydrochloric or nitric acid or in aqua regia, but it is attacked by hot concentrated sulphuric acid or on fusion with potassium bisulphate—a unique property among the platinum metals; when alloyed with other metals and especially with lead, it is soluble in other strong acids. Fused with nitre and caustic potash it is oxidized to Rh_2O_3 . From the commonest commercial salt, sodium rhodium chloride, $\text{Na}_2\text{RhCl}_6 \cdot 12\text{H}_2\text{O}$, other rhodium salts may readily be prepared by precipitating from its solution the yellow hydroxide $\text{Rh}(\text{OH})_3$ with an equivalent amount of caustic potash (the hydroxide is soluble in excess), filtering and washing the precipitate and dissolving it in the desired acid. The hydroxide being a stronger base than that of most of the other metals of this group, rhodium salts, even of organic acids, may easily be prepared by this process.

Four oxides of rhodium are known, Rh_2O , RhO , Rh_2O_3 and RhO_2 ; of these Rh_2O_3 is of some importance as being the oxide from which ordinary rhodium salts are derived. It is a black, sparingly soluble powder produced by heating the corresponding hydroxide. Rhodium chloride, RhCl_3 , can be produced either by heating finely divided rhodium in a stream of chlorine or by dis-

solving the corresponding hydroxide in hydrochloric acid. The latter process first gives a yellow solution, which on heating assumes a rose-red colour and on careful evaporation gives a residue of a gummy, deliquescent hydrated chloride. This on further heating loses its water and becomes insoluble. Two new chlorides of rhodium, RhCl_2 and RhCl , have been prepared by Wöhler and Müller (1926). The simple chloride RhCl_3 readily produces double chlorides with the chlorides of the alkali metals, having the general formula $\text{M}_2\text{RhCl}_6 \cdot x\text{H}_2\text{O}$.

Rhodium sulphate, $\text{Rh}_2(\text{SO}_4)_3 \cdot 12\text{H}_2\text{O}$, is formed from the yellow hydroxide by solution in dilute sulphuric acid. The double sulphate $\text{K}_2\text{Rh}_2(\text{SO}_4)_6$, produced by fusing rhodium with potassium bisulphate, is soluble in water and gives rose-coloured crystals on evaporation to dryness. Rhodium sulphate also combines with alkaline sulphates to form true alums isomorphous with ordinary alum. The best known example is potassium rhodium alum, $\text{K}_2\text{SO}_4 \cdot \text{Rh}_2(\text{SO}_4)_3 \cdot 24\text{H}_2\text{O}$. (See ALUM.)

Rhodium forms several series of compounds with ammonia: the best known are the rosco, purpureo and luteo compounds which are similar to the corresponding cobalt compounds (see COBALT). Technically, little use has been found for rhodium compounds, although it is essential in small amounts in the manufacture of "liquid gold." A rhodium-platinum alloy is in general use as one of the elements in a thermocouple for measuring high temperatures. (F. E. M.)

RHODOCHROSITE, a mineral consisting of manganese carbonate, MnCO_3 , crystallizing in the rhombohedral system and isomorphous with calcite. It usually occurs as cleavable, compact or botryoidal masses, distinct crystals being somewhat rare; these have the form of the primitive rhombohedron, parallel to the faces of which there are perfect cleavages. The specific gravity varies from 3.45 to 3.60; the hardness is 4. The colour is usually rose-red but may sometimes be gray to brown. The name rhodochrosite, from the Greek *ῥόδο-χρως* (rose-coloured), has reference to the characteristic colour of the mineral; manganese-spar and dialogite are synonyms. It is found in mineral veins with ores of silver, lead, copper, etc., or in deposits of manganese ore. The mineral is used in making spiegeleisen and ferromanganese.

RHODODENDRON, a large genus of shrubs and trees belonging to the heath family (Ericaceae). No adequate botanical distinction can be drawn between this genus and *Asalea* or *Rhodora* (*q.v.*), although the two latter are usually kept distinct by gardeners. The rhododendrons are trees or shrubs, never herbs, with simple, evergreen or deciduous leaves, and flowers in terminal clusters surrounded in the bud by bud-scales but not as a rule by true leaves. The flowers are remarkable for the frequent absence or reduced condition of the calyx. The funnel- or bell-shaped corolla, on the other hand, with its five or more lobes, is usually conspicuous, and in some species so much so as to render these plants greatly prized in gardens. The free stamens are usually ten, with slender filaments and anthers opening by pores at the top. The ovary is five- or many-celled, ripening into a long woody pod which splits from top to bottom into a number of valves, liberating a large number of small bran-like seeds.

The species, which exceed 600 in number, are for the most part natives of the mountainous regions of the northern hemisphere, extending as far south as the Malay archipelago and New Guinea but not hitherto found in South America or Australia; none is native to Great Britain. They vary greatly in stature, some of the alpine species being mere pygmies with minute leaves and tiny blossoms, while some of the Himalayan species are moderate-sized trees with huge flowers. Some are epiphytall, growing on the branches of other trees but not deriving their sustenance from them. Several notably handsome species are natives of North America. Among these are the great rhododendron (*R. maximum*), called also great laurel and rose bay, found from Nova Scotia and Ontario and southward to Georgia; the Catawba or Carolina rhododendron or mountain rose bay (*R. catawbiense*), of the high Appalachian mountains; the western rhododendron (*R. macrophyllum*), found from British Columbia to California, and adopted as the state flower of Washington; and the delicate *rhodora* (*q.v.*), of the northeastern states. The great laurel and

the mountain rose bay are widely planted; less frequently *R. minus* and *R. carolinianum*, both small evergreen shrubs with showy flowers, native to the mountains of the southeastern states, are grown as ornamentals. The varieties grown in gardens are mostly grafted on the Pontic species (*R. ponticum*) and the North American *R. calawbiense*. The common Pontic variety is fine for game-covert, from its hardness, the shelter it affords, and the fact that hares and rabbits rarely eat it. Variety of colour has been infused by crossing or hybridizing the species first named, or their derivatives, with some of the more richly coloured Himalayan-American varieties. More than 1,000 named horticultural forms comprise some of the finest ornamental shrubs in cultivation.

The hardy evergreen kinds are readily propagated by seed, by layers and by grafting. Grafting is resorted to only for the propagation of the rarer and more tender kinds. Loamy soil containing a large quantity of peat or vegetable humus is essential, the roots of all the species investigated being associated with a fungus partner or mycorrhiza (*g.v.*). An excess of lime or chalk in the soil proves fatal to rhododendrons and their allies, sooner or later. The hardy deciduous kinds are valuable for forcing, and withstand cold-storage treatment well.

Rhododendrons in America are unsuited to regions of extreme summer heat and deficient rainfall, hence are best cultivated along the Atlantic seaboard, in the Alleghenies or on the Pacific coast, generally north of San Francisco. (N. Tr.; X.)

RHODONITE, a member of the pyroxene group of minerals, consisting of manganese metasilicate, $MnSiO_3$, and crystallizing in the anorthic system. It commonly occurs as cleavable to compact masses with a rose-red colour; hence the name, from the Greek *ῥόδον* (a rose). Crystals often have a thick tabular habit; there are perfect cleavages parallel to the prism faces. The hardness is 5½–6, and the specific gravity 3.4–3.68. Rhodonite is liable to alteration, and in certain cases forms the primary source of very important deposits of ores of manganese, mainly in the form of oxides; such are a considerable part of the manganese ores of India, now exploited on a very large scale. In the iron and manganese mines at Pajsberg near Filipstad and Långban in Värmland, Sweden, small brilliant and translucent crystals ("pajsbergite") and cleavage masses occur. Rhodonite occurs as large, rough crystals, resembling pink feldspar, with franklinite and zinc ores, in granular limestone at Franklin Furnace in New Jersey.

RHODORA (*Rhodora canadensis*), a beautiful North American flowering shrub of the heath family (*Ericaceae*), native to bogs and wet hill-sides from Newfoundland to Quebec and southward to central New York and Pennsylvania. It grows from 1 to 3 ft. high, with pinkish-purple, two-lipped, somewhat honey-suckle-like flowers, about 1½ in. broad, in terminal clusters, appearing in May or June.

The plant is perhaps best known from Emerson's poem concerning it. (See RHODODENDRON.)

RHOECUS, a Samian sculptor of the 6th century B.C. He and his son Theodoros were especially noted for their work in bronze. Herodotus says that Rheucus built the temple of Hera at Samos. In the temple of Artemis at Ephesus was a marble figure of night by Rheucus. His name has been found on a fragment of a vase which he dedicated to Aphrodite at Naucratis. His sons Theodoros and Telecles made a statue of the Pythian Apollo for the Samians.

RHONDDA, DAVID ALFRED THOMAS, 1st Viscount, cr. 1918 (1856–1918), British colliery owner and statesman, was born on March 26, 1856, in Aberdare. His father had enriched himself by speculations in coal. Thomas was educated at Clifton College, and Caius College, Cambridge, where he graduated in the mathematical tripos in 1880. Immediately he joined

his father in the coal business, into which he threw himself with great energy and ability. His extraordinary commercial gifts, his insight, his foresight and the sympathy which he brought to bear on conditions of life in the mining industry, soon made him a prominent, and eventually the leading, figure in the industrial world of South Wales. His business combinations brought him great wealth, and culminated in the Cambrian supercombine, which produced some 6,000,000 tons of steam coal a year.

Though he had sat as a Liberal for Merthyr Tydfil for 22 years from 1888, and for Cardiff for a few months in 1910, Thomas achieved no political importance till the outbreak of the World War, when he rendered substantial help to Lloyd George, both at the Exchequer and at the Ministry of Munitions by organizing British industrial resources. He went to America to complete some war contracts for the Government, and on his return was saved, with his daughter, from the sinking of the "Lusitania." He went back to America almost immediately, and spent seven months there at his own expense, expediting the output of munitions. He was created a baron, as Lord Rhondda, for his services, in Jan. 1916; and took office in Lloyd George's Ministry in the following Dec. as President of the Local Government Board, passing to the Food Controlship in June 1917. There, taking strong steps to put an end to speculation in the necessities of life, he gradually fixed prices and brought supplies under control.

But he will be mainly remembered as the author of the system of compulsory food rationing, which was carried out with absolute fairness and impartiality. In April 1918 he tendered his resignation; but pressure was put upon him to remain. He died on July 3 at Llanwen, Monmouthshire. Just previously he had been created a Viscount. He married Sybil Margaret Haig, a cousin of Lord Haig. Their only child, a daughter (who married Sir Humphrey Mackworth in 1905), and obtained a dissolution of their marriage in 1923, succeeded to the viscounty of Rhondda under a special remainder. In 1921 Lady Rhondda published a *Life of her father*.

RHONDDA, an urban district of Glamorganshire, South Wales, 12 m. long by about 4½ m. across at its widest part, comprising two main valleys, named after their respective rivers, Rhondda Fawr and Rhondda Fach. The valleys are deeply incised in the coal measures of the South Wales geological basin and their lateral boundaries are formed by hills varying from 500 ft. near Trehafod to 1,340 ft. on the north-east of Maerdy in the Rhondda Fach and 1,742 ft. on the south-west of Treherbert in the main valley. The upper end of the latter valley culminates in Carn Moesen (1,950 feet). The two valleys are separated by the ridge of Cefn-rhondda, which ranges from 600 ft. above Porth to 1,690 ft. near the upper end of the district. There are tributary valleys of which Cwmparc, Clydach vale, and Cymer are the chief.

The Rhondda valley is the centre of the eastern division of the South Wales coalfield. The development of the Rhondda coalfield was later than that of the northern sections of the South Wales area, where coal was worked early for iron smelting. It was the unsurpassed steam-raising properties of the Rhondda coal that made the region famous after the period 1860–65. With the great demands made for steam-coal by the ever increasing railway traffic, steam-ship service and navies of the last half of the 19th century, the Rhondda from being a purely pastoral upland region was transformed into a densely-populated industrial valley. No thought was given to the elongated straggling settlements that grew up or to the development of by-products to ensure employment in the region when the coal exporting phase would pass away.

Furthermore, in the elongated settlements (the whole of the Rhondda valleys from Blaen-rhondda and Maerdy to Porth and Pontypridd is now one long winding street) the absence of central buildings, public squares, and shopping centres counted against the development of a strong civic sense—a feature that became more acute in an industrial region such as this, with no tradition of previous settlement and with a population almost all engaged on one kind of work for masters living usually far away.

The population was estimated at 23,950 in 1871, but it reached 55,632 in 1881 and 113,735 in 1901. In 1931 it was 141,344, but

BY COURTESY OF THE WILD FLOWERS PRESERVATION SOCIETY

RHODORA (RHODORA CANADENSIS)
A delicate pink flower found in Canada and New England

by 1938 it had fallen to 121,940 (est.) owing to the depression of the 1930s. Area of urban district 37.3 sq.mi.

With the development of the coal exporting trade a number of small railway companies connected these valleys with Cardiff on the one hand and via the Blaengwynfi tunnel with Port Talbot and Swansea on the other hand. All these smaller lines were amalgamated with the G.W. railway. The lack of demand for steam coal, trade depression and changes in the world-market following World War I seriously affected the region. Depopulation, unemployment and poverty became very marked. Of Rhondda valley's 61,460 insured men in May 1934, more than 47% were unemployed. To relieve the condition, the establishment of new industries has been encouraged.

RHÔNE, a department of south-eastern France, formed in 1793 from the eastern portion of the department of Rhône-et-Loire, and comprising the old districts of Beaujolais, Lyonnais, Franc-Lyonnais, Forez and a small portion of Dauphiné. Pop. (1936), 1,028,379. Area, 1,104 sq.mi. Rhône is bounded north by the department of Saône-et-Loire, east by Ain and Isère and south and west by Loire. The Saône and the Rhône form its natural boundary to the east. The department belongs almost entirely to the basin of the Rhône, to which it sends its waters by the Saône and its tributary the Azergues, and by the Gier. The mountains which cover the surface of the department constitute the watershed between the Rhône and the Loire, and from north to south form four successive groups—the Beaujolais mts., the highest peak of which is 3,320 ft.; the Tarare group; the Lyonnais mts. (nearly 3,000 ft.); and Mt. Pilat, the highest peak of which belongs to the department of Loire.

Good agricultural land is found in the valleys of the Saône and Rhône, but for the most part the soil is stony and only moderately fertile. Wheat, oats, rye and potatoes are widely grown, with colza on the banks of the Saône, but they are less important than the vine, the hills of the Beaujolais on the right bank of the Saône producing excellent wines. Mines of copper pyrites and coal and quarries of marble (at Bully) are worked. The production of silk fabrics, the chief branch of manufacture of artificial silk goods, of chemicals and machinery, together with most of the other industries of the department, are concentrated in Lyons (*q.v.*) and its vicinity. Tarare is a centre for the manufacture of velvet, muslin and embroidery. Oullins has large railway workshops belonging to the P.L.M. railway, and there are important glass works at Lyons and at Givors. Cotton-spinning and weaving are carried on in several localities.

The department is served by the P.L.M. railway. The Rhône and the Saône and in the extreme south the canal of Givors are its navigable waterways. Lyons, the capital, is the seat of an archbishop and of a court of appeal and centre of an educational division (*académie*). The department is in the 14th military region. There are two arrondissements (Lyons and Villefranche) subdivided into 33 cantons and 269 communes. The principal places besides Lyons are Givors, Tarare and Villefranche (*qq.v.*).

RHÔNE, one of the most important rivers in Europe, and the chief of those which flow directly into the Mediterranean. It rises at the eastern extremity of the Swiss canton of the Valais, flows through Switzerland and France and enters the Mediterranean at the Gulf of Lyons. Its total length is 505 m., of which the Lake of Geneva, through which it flows, claims 45 m.; and its total fall is 5,398 feet. Its course (excluding the Lake of Geneva, *q.v.*) naturally falls into three divisions: (1) from its source to the Lake of Geneva (105½ m. and fall 4,679 ft.); (2) from Geneva to Lyons (124 m. and fall 689 ft.) and (3) from Lyons to the Mediterranean (230 m. and fall 530 ft.).

From its Source to the Lake the Rhône is a purely Alpine river, flowing through a great trench first in a synclinal structure between the Aar and St. Gothard massifs, then along the front of the Pennine nappes (See ALPS). It issues as a torrent, at the height of 5,909 ft. from the Rhône glacier at the head of the Valais. It is almost immediately joined (left) by the Mutt torrent, coming from a small glacier and then flows past the Gletsch hotel (where the roads from the Grimsel and the Furka pass

unite). About half a mile from the glacier the river descends through a wild gorge to the more level valley, to reach the first village, Oberwald. It preserves a south-westerly direction till Martigny.

The uppermost valley of the Rhône is named Goms, its chief villages being Münster and Fiesch, whilst the river is swollen by mountain torrents, descending from the glaciers on either side, by the Geren (left), near Oberwald; by the Eginen (left), near Ulrichen; by the Fiesch (right), from the Fiesch glacier, at Fiesch; by the Binna (left), near Grengiols; by the Massa (right) from the Aletsch glaciers, above Brig. At Brig the Rhône has descended 3,678 ft. from its source in 28 m., and is already a considerable stream when joined (left) by the Saline descending from the Simplon Pass. Its course below Brig is less rapid and lies through wastes of alluvial deposits. The valley is wide and marshy, the river frequently overflowing its banks. Further mountain torrents fall into the Rhône: these are the Visp (left) from the Zermatt valley, at Visp; at Gampel, the Lonza (right) from the Lötschen valley; at Leuk, the Dala (right) from the Gemmi Pass; at Sierre, the Navizen (left) from the Efinisch or Anniviers valley; at Sion, the capital of the Valais, the Borgne (left) from the Val d' Hérens; below Sion, by the Morze (right), from the Sanetsch pass; and at Martigny by the Dranse (left) from the Great St. Bernard and the Val de Bagnes. At Martigny, the river bends sharply to the north-west toward the Lake of Geneva. Opposite Doréaz it receives the Salafte (left). Immediately below St. Maurice the Rhône rushes through a narrow and striking defile which commands the entrance of the Valais.

Beyond, the river enters the wide alluvial plain, formerly occupied by the south-eastern arm of the Lake of Geneva, but now marshy. It receives at Bex the Avançon (right) flowing from the glaciers of the Diablerets range, at Monthey the Vièze (left) from Champéry and the Val d' Illiez, and at the Aigle the Grande Eau (right), from the valley of Ormonts-dessus. It passes Port Valais, once on the lake, before expanding into the Lake of Geneva, between Villeneuve (right) and St. Gingolph (left). During all this portion of its course the Rhône is not navigable, but its valley forms an artery into the Alps which is followed by the railways and roads.

The Upper Rhône, being fed by glacial streams, is overladen with sediment, much of which is deposited along the course, the remainder settling down in the Lake of Geneva, in the blue waters of which it is possible to follow the whiter course of the stream for some distance before it disappears.

From Geneva to Lyons.—About ½ m. below Geneva the blueness of the water of the Rhône is again disturbed by the Arve (left), from the glaciers of the Mont Blanc range, the two currents for some distance refusing to mix. The Rhône is here forced southward by the sweep of the Jura folds through which it breaks in a number of narrow gorges or *chutes*. It continues southward until joined near Corbeline by the Guier (left), from the Grande Chartreuse mountains and it continues the direction of this tributary thus rounding the southern spur of the Juras.

About 12 m. south of Geneva the Rhône enters France. At Bellegarde the Valserine flows in (right), and then the river resumes its southerly direction, from which a great gorge has deflected it for a while. Some way below Bellegarde, between Le Parc and Pyrimont, the Rhône becomes officially "navigable" though as far as Lyons the navigation consists almost entirely of flat-bottomed boats. Above Seyssel the Usès (left) joins the Rhône, while just below that village the Fier (left) flows in from the Lake of Annecy. Below the junction of the Fier the hills sink on either side, the channel of the river widens and it leaves the mountains for the plains. The Geneva-Paris railway follows the river as far as Culoz. The Rhône receives the waters from Lake Bourget by a canal (left). The last of the *chutes* is at the Pont du Saut or Sault, a little south of Lagnieu. The river now widens but the neighbouring country is much exposed to inundations.

It receives the Ain (right), which descends from the French slope of the Jura and is navigable for about 60 m., above its

junction with the Saône, just below Lyons. The Saône (q.v.) which has received (left) the Doubs, is the real continuation of the lower Rhône, both from a geographical and a commercial point of view, and it is by the means of canals branching off from the course of the Saône that the Rhône communicates with the basins of the Loire, the Seine, the Rhine and the Moselle.

Below Lyons, the Rhône becomes one of the great historical rivers of France. It was up its valley that various civilizations penetrated from the Mediterranean to Lyons. From Lyons downwards the left bank serves as a great medium of commerce by which central France sends its products to the sea. During this half of its course it flows over an alluvium-filled valley resting on Jurassic and Cretaceous rocks, and it can boast of having on its left bank (the right bank is very poor in this respect) such historical cities as Vienne, Valence, Avignon, Tarascon and Arles, while it receives (left) the Isère, the Drôme, the Aygues and the Durance rivers, all formed by the union of many streams from the Dauphiné Alps.

The Ardèche is the only considerable affluent from the right. Near Arles, about 25 m. from the sea, and by rail 1754 m. from Lyons, the river breaks up into two main branches, the Grand Rhône running south-east and the Petit Rhône south-west; they enclose between them the delta of the Camargue, which is cultivated on the banks of the river only, but elsewhere is simply a great alluvial plain, composed of scanty pastures and of great salt marshes. Changes in sea level have taken place in the Rhône delta in recent times. R. D. Oldham (*Nature*, vol. cxvi, [1925] pp. 16, 52, 100), shows that in Pre-Roman times the sea-level was 15 ft. higher than today. A rise was followed by a subsidence which occurred in about the 8th century when the river ended far inland in a shallow land-locked inlet which it proceeded to fill up with alluvium until in the 17th century it had regained the sea-front. Even since that time it has greatly modified its form by changes of channels, etc.

The Rhône river system is dominated by two tectonic features, the Alps and the Central Plateau of France. Below Chalon-sur-Saône, the Saône-Rhône flows along the eastern side of the central plateau and most of the course is determined by a north to south fault. The remainder of the river system is determined by the structure of the Alps (q.v.). The greater length of the river and of its Alpine affluents is parallel to the trend of the structures, as above Martigny, between the Lake of Geneva and Corbeline, the Arve in the Chamonix valley and parts of the Isère and of the Durance. On the other hand other portions flow radially to the trend, as between Martigny and the Lake of Geneva, parts of Isère, the Drôme, the Aygues, the Durance and numerous other tributaries.

RHOXOLANI, a Sarmatian tribe defeated in the Crimea by Diophantus, general of Mithradates, c. 100 B.C., and by the Romans on the lower Danube c. A.D. 60, and also under M. Aurelius. They seem to have finally succumbed to the Goths.

RHUBARB. This name is applied both to a drug and to a vegetable.

r. The drug has been used in medicine from very early times, being described in the Chinese herbal *Pen-king*, which is believed to date from 2700 B.C. It is still produced in the four northern provinces of China. In England the culture of rhubarb for medicinal purposes began in 1777 at Banbury in Oxfordshire and is still carried on there.

Two varieties of the drug are known, *viz.*, kiln-dried and sundried. So-called "Turkey" rhubarb was the Chinese drug which reached Europe from Aleppo and Smyrna, having travelled to Asia Minor by way of Persia and the Caspian.

Chemistry.—The most important constituent of this drug, giving it its purgative properties and its yellow colour, is chrysarobin, $C_{20}H_{26}O_6$, formerly known as rhein or chrysophan. The rhubarb of commerce also contains chrysophanic acid, a dioxymethyl anthra-quinone, $C_{14}H_8(CH_2O)_2(OH)_2$, of which chrysarobin is a reduction product.

Nearly 40% of the drug consists of calcium oxalate, which gives it the characteristic grittiness. There is also present rheo-tannic acid, which is of some practical importance. There are

numerous other constituents, such as emodin, $C_{15}H_{10}O_5$, mucilage, resins, rheumatic acid, $C_{20}H_{26}O_6$, aporphetin, etc.

The dose of rhubarb is from $\frac{1}{4}$ up to 30 grains, according to the action which is desired. The Pulvis Rhei Compositus of the *British Pharmacopoeia*, or Gregory's powder, is composed of 2 parts of rhubarb, 6 of heavy or light magnesia and 1 of ginger. The dose is 20 to 60 gr. The United States *Pharmacopoeia* includes the tincture, syrup and extract of rhubarb.

Rhubarb is occasionally administered in the form of powder, but more commonly it is employed in the form of one of its preparations. Rhubarb and the extract are cathartic, bitter tonic and stomachic, while the aromatic tincture and the aromatic syrup are laxative and to a slight extent astringent. As cathartics they act chiefly on the colon and have a tendency to produce constipation after the initial laxative effect. Hence they are useful in the beginning of diarrhoea as they cause the expulsion of irritating substances and promote a return to normal by their constipating influence.

Some chrysarobin is absorbed and is excreted in the urine, which it slightly increases and colours a reddish brown. The colour is discharged by the addition of a little dilute hydrochloric acid to the urine.

2. The vegetable rhubarb (*Rheum raphaniticum*), also called pie plant (family Polygonaceae), is a hardy Asiatic perennial grown for its large, succulent leafstalks. The plant produces large clumps of enormous leaves, up to 2 ft. across, on proportionately large petioles or leafstalks—an inch or more in diameter and up to 3 ft. or more in length—that arise from a shortened underground stem. These huge leaves arise early in the spring; later in the season a large central flower stalk may appear and bear numerous small white flowers and three-angled or winged fruits containing one seed. The plant is best adapted to the cooler parts of the temperate zones; the roots are quite hardy to cold although the tops are killed in autumn.

Rhubarb seed does not produce plants true to the variety that bears them; therefore it is propagated by dividing the perennial "crown" into pieces each consisting of a root piece and a bud. These are set in the field about 4 or 5 ft. apart each way. The large crowns are sometimes moved into forcing houses in late winter for producing the leafstalks under artificial heat, and in subdued light. A greenhouse is not necessary. Only the fleshy leafstalks are eaten; they are highly acid and contain considerable amounts of oxalates. The leaves should never be eaten since they are sometimes poisonous.

RHYL, a watering-place and urban district of Flint, North Wales, 30 mi. N.W. of Chester on the L.M.S.R. Pop. (1938) 15,680. Area, 2.6 sq.m. It is situated on a sandy coast near the mouth of the Clwyd. It was originally a small fishing village with a little coastal trade, and is now an important watering-place.

RHYME, more correctly spelled *rim*, from Provençal word *rim* (its customary English spelling is due to a confusion with *rhythm*), a literary ornament or device consisting of an identity of sound in the terminal syllables of two or more words. In the art of versification it signifies the repetition of a sound at the end of two or more lines in a single composition. This artifice was practically unknown to the ancients, and when it occurs, or seems to occur, in the works of classic Greek and Latin poets, it must be considered to be accidental. Conscious rhyme came later. The name given to lines with an intentional rhyme in the middle is *Leonine verse*, the invention being attributed to a probably apocryphal monk Leoninus or Leonius, who is supposed to be the author of a history of the Old Testament preserved in the Bibliothèque Nationale of Paris. This "history" is composed in Latin verses, all of which rhyme in the centre. Recent criticism has been inclined to look upon the African church-Latin of the age of Tertullian as the starting-point of modern rhyme, and it is probable that the ingenuities of priests, invented to aid worshippers in hearing and singing long pieces of Latin verse in the ritual of the Catholic church produced the earliest conscious poems in rhyme. It is certain that by the 4th century a school of rhymed sacred poetry had come into existence, classical examples of which we still possess in the "Stabat Mater" and the "Dies Irae." In

the course of the middle ages, alliteration, assonance and end-rhyme held the field without a rival in vernacular poetry. After the 14th century, in the north of Europe, and indeed everywhere except in Spain, where assonance held a powerful position, end-rhyme became universal and formed a distinctive indication of metrical construction. It was not until the invention of blank verse (*q.v.*) that rhyme found a modern rival. Certain forms of poetry are almost inconceivable without rhyme, though efforts have been made to compose even rhymeless sonnets. In the heyday of Elizabethan literature a serious attempt was made in England to reject rhyme altogether, and to return to the quantitative measures of the ancients. The prime mover in this heresy was a pedantic grammarian of Cambridge, Gabriel Harvey (1545?-1630). For a short time he actually seduced no less melodious a poet than Edmund Spenser to abandon rhyme and adopt a system of accented hexameters and trimeters. From 1576 to 1579 the genius of Spenser seems to have been obscured by this error of taste, but he shook it off completely when he composed *The Shepherd's Calendar*. Thomas Campion, in a tract published in 1602, advocated the omission of rhyme from lyrical poetry. By dint of a prodigious effort, he produced some unrhymed odes, which were not without charm, but the best critics of the time, such as Daniel, repudiated the innovation.

In Germany a determined attack on rhyme was made early in the 17th century, particularly by a group of aesthetic critics in the Swiss universities. Lessing recalled the German poets to a sense of the beauty and value of rhyme, but the popularity of Klopstock and his imitators continued to exercise a great influence. Goethe and Schiller, without abandoning rhyme, permitted themselves a great liberty in the employment of unrhymed measures and in imitation of classic metres. This was carried to greater lengths by Platen and Heine, the rhymeless rhythm of the last of whom was imitated in English verse by Matthew Arnold and others. In France, on the other hand, the empire of rhyme has always been triumphant, and in French literature the idea of rhymeless verse could till recently scarcely be said to exist.

In Italian literature the excessive abundance and facility of rhyme has led to a rebellion against its use. It was the influence of German aesthetics which forced upon the notice of Leopardi the possibility of introducing rhymeless lyrical measures into Italian verse, an innovation which he carried out with remarkable hardihood and success. The rhymeless odes of Carducci are also worthy of admiration. At the close of the 19th century, particularly in France, where the rules of rhyme had been most rigid, an effort was made to modify and minimize the restraints of rhyme. The laws of rhyme, like other artificial regulations, may be too severe, but there is no evidence that the natural beauty which pure rhyme introduces into poetry is losing its hold on the human ear or is in any real danger of being superseded by accent, assonance, or rhythm.

See J. B. Schütze, *Versuch einer Theorie des Reimes nach Inhalt und Form* (Magdeburg, 1801); J. Minor, *Neuhochdeutsche Metrik* (Strasbourg, 1893); J. B. Mayer, *A Handbook of Modern English Metre* (1903); Egerton Smith, *The Principles of English Metre* (Oxford, 1923); Henry Lane, *The Physical Basis of Rime* (1931).

RHYMNEY, an urban district of Monmouthshire, England, on the borders of Glamorganshire, 22 mi. N.W. of Cardiff, on the G.W.R. Pop. (1938) 9,437. Area, 4.25 sq.mi. The Rhymney river, in the upper valley of which this town lies, forms almost throughout its course the boundary between England and Wales (Monmouthshire and Glamorganshire). The district belongs to the south Wales iron field.

RHYNIÉ: see **CHEKÉ**.

RHYOLITE, the group name of a type of volcanic rock, occurring mostly as lava flows, characterized by a highly acid composition, and so called from Gr. *ῥέω*, *to flow* (because of the frequency with which they exhibit fluxion structures). They are the most siliceous of all lavas, and, with the exception of the dacites, are the only lavas with free primary quartz. In chemical composition they very closely resemble the granites, the corresponding rocks of plutonic or deep-seated origin; their minerals also present many points of similarity to those of granite though they are by no means entirely the same. Quartz, orthoclase and

plagioclase feldspars, and biotite are the commonest ingredients of both rocks, but the quartz of rhyolites is full of glass enclosures and the potash feldspar is pellicled sanidine, while the quartz of granite contains dust-like fluid cavities of very minute size and its potash feldspar is of the turbid variety which is properly called orthoclase. The granites also are holocrystalline, while in the rhyolites there are usually porphyritic crystals floating in a fine ground-mass. Rhyolites have also been called liparites because many of the lavas of the Lipari Islands are excellent examples of this group. Above all rocks they have a disposition to assume vitreous forms, as when fused they crystallize with great difficulty; the vitreous forms are known as obsidian, perlitic and pumice (*q.v.v.*).

Mineral Constituents.—The minerals of the first generation, or phenocrysts, of rhyolite are generally orthoclase, oligoclase, quartz, biotite, augite, or hornblende. The feldspars are usually glassy clear, small but of well-developed crystalline form: the potash feldspar is sanidine, usually Carlsbad twinned; the soda-lime feldspar is almost always oligoclase, with characteristic polysynthetic structure. Both of these may be corroded and irregular in their outlines; their cleavage and twinning then distinguish them readily from quartz. The quartz occurs as blebs or sub-rounded grains, which are corroded double hexagonal pyramids. In some rhyolites apparent crystals of quartz or feldspar are found under the microscope to consist of a micrographic intergrowth of the two. Biotite is always deep brown or greenish brown, in small hexagonal tablets, generally blackened at their edges by magmatic corrosion. Muscovite is not known in rhyolites. Hornblende may be green or brown; in the quartz-pantellerites it sometimes takes the form of strongly pleochroic brown crossryte. Like biotite it is idiomorphic but often corroded in a marked degree. Augite, which is equally common or more common than the other ferro-magnesian minerals, is always green; its crystals are small and perfectly shaped, and corrosion phenomena are very rarely seen in it. Zircon, apatite and magnetite are always present in rhyolites, their crystals being often beautifully perfect though never large. Olivine (fayalite) is never a normal ingredient, but occurs in the hollow spherulites or lithophysae of some rhyolites with garnet, tridymite, topaz and other minerals which indicate pneumatolytic action.

Types of Texture.—The ground-mass of rhyolitic rocks is of three distinct types which are stages in crystalline development, viz., the vitreous, the felsitic or cryptocrystalline, and the microcrystalline. Mixtures of the different kinds occur; thus a vitreous rhyolite has often felsitic areas in its ground-mass, and in the same lava flow some parts may be vitreous while others are felsitic. The vitreous rhyolites are identical in most respects with the obsidians, from which they can only be separated in an artificial classification; and in their glassy base the banded or eutaxitic, spherulitic and perlitic structures of pure obsidians are very frequently present (see **OBSDIAN**; **PERLITE**). The felsoliparites or liparites with stony ground-mass are specially common among the pre-Tertiary igneous rocks, as liparite glass is unstable and experiences devitrification in course of time. Many of these felsites have fluxion banding, spherulites and even perlitic cracks, which are strong evidence that they were originally glassy. In other cases a hyaloliparite, obsidian or pitchstone becomes felsitic along its borders and joint planes, or even along perlitic cracks, and we may assume that the once glassy rock has changed into felsite under the action of percolating moisture or even by atmospheric decomposition. In many rhyolites the felsite is original and represents an incipient crystallization of the vitreous material which took place before the rock was cold. The felsite in turn is liable to change; it becomes a fine mosaic of quartz and alkali feldspar; and in this way a matrix of the third type, the microcrystalline, may develop. This is proved by the occurrence of the remains of spherulitic and perlitic structures in rocks which are no longer felsitic or glassy. Many microcrystalline rhyolites have a ground-mass in which much felsitic matter occurs; but as this tends to recrystallize in course of time, the older rocks of this group show least of it. Whilst no quartz-bearing rhyolites are known to have been erupted in recent years, Lacaze proved that portions of the "spine" which rose as a great

tower or column out of the crater of Mont Pelée after the eruption in 1906 contained small crystals of quartz in the ground-mass. The microcrystalline ground-mass of rhyolites is never micrographic as in the porphyries (granophyres); on the other hand it is often micropikilitic, consisting of small feldspars, often subrectangular, embedded in little rounded or irregular plates of quartz.

Changes of Ground-mass.—The ground-mass of rhyolites is liable to other changes, of which the most important are silicification, kaolinization and sericitization. Among the older rocks of this group it is the exception to find that secondary quartz has not been deposited in some parts of them. Often indeed the matrix is completely replaced by silica in the form of finely crystalline quartz or chalcedony; and these rocks on analysis prove to contain over 90% of silica. In the recent rhyolites of Hungary, New Zealand, etc., the deposit of coarse opal in portions of the rock is a very common phenomenon.

Kaolinization may be due to weathering, and the stony dull look of the matrix of many microcrystalline rhyolites is due to the decomposed state of the feldspar grains in them; it is even more typically developed by fumarole action, which replaces the feldspars with soft, cloudy white products belonging to a mineral of the kaolin group. Sericitization, or the development of fine white mica after feldspar, is usually associated with shearing, and is commonest in the older rhyolites.

Vesicular structure is very common in rhyolites; in fact the pumiceous obsidians have this character in greater perfection than any other rocks (see FUSATE); but even the felsic-rhyolites are very often vesicular. The cavities are usually lined with opal and tridymite; in the older rocks they may be filled with agate and chalcedony. The "mill-stone porphyries," extensively used in Germany for grinding corn, are porous rhyolites; the abundance of quartz makes them hard, and their rough surfaces render them peculiarly suitable for this purpose. In some of them the cavities are partly secondary. These rocks are obtained in the Odenwald, Thuringerwald and Fichtelgebirge.

Occurrence.—In Britain a pale grey Tertiary rhyolite occurs at Tardree, Arnam, and in Skye. Felsitic rhyolites occur among the Old Red rocks of Scotland (Penland Hills, Lorne, etc.), in Devonshire, and in large numbers in North Wales. The Carnarvonshire rhyolites are often much altered and silicified; many of them have a nodular structure which is very conspicuous on weathered surfaces. The spheroids may be two or three in diameter; some are built up of concentric shells. Rhyolites are also known from Fishguard, Malvern, Westmorland and Co. Waterford. One of the oldest volcanic rocks of Britain (pre-Cambrian, Uriconian) is the spherulitic rhyolite of the Lea Rock near Wellington, Shropshire. It shows bright red spherulites in great numbers and is probably an obsidian completely devitrified. Perlitic structure is also visible in it.

In other parts of Europe rhyolites have a fairly wide distribution though they are not numerous. In Hungary (Hlinik, etc.) there are many well-known examples; they extend along the margin of the Carpathians and are found also in Siebenbürgen. In Italy they occur in the Euganean Hills and in the Lipari Islands; the latter being the principal source of pumice at the present day. Rhyolites of Recent age occur in Iceland (Myvatn, etc.), where they are characterized by the frequent absence of quartz, and the presence of much plagioclase and pyroxene. Some of these rocks have been called trachyte-obsidians, but they seem to be rhyolites which contain an exceptionally large amount of soda. The older rhyolites, which are generally called quartz-porphyrines in Germany, are mostly of Permian or Carboniferous age and are numerous in the Vosges, Odenwald, Thuringerwald, etc. They are often accompanied by basic rocks (melaphyres). Permian rhyolites occur also at Lugano in Italy. Rhyolites are known also in Asia Minor and the Caucasus, in New Zealand, Colorado, Nevada and other parts of western North America. In the Yellowstone National Park there is a well-known cliff of obsidian which shows remarkably perfect columnar jointing. Some of the rhyolites of Nevada are exceedingly rich in porphyritic minerals, so that they appear at first sight to be holocrystalline rocks, since

the ground-mass is scanty and inconspicuous. To this type the name *nevadite* has been given, but it is rare and local in its distribution.

In Pantellaria, south-west of Sicily, there are rocks of rhyolitic affinities which present so many unusual features that they have been designated *pantellarites*. They contain less silica and alumina and more alkalis and iron than do ordinary rhyolites. Their feldspars are of the anorthoclase group, being rich in soda together with potash, and are very variable in crystalline development. Aegirine-augite and forms of soda-amphibole are also characteristic of them, while dark brown aeginitite or cossyrite often occur. Quartz is not plentiful; other ingredients are olivine, arfvedsonite and tridymite. The ground-mass varies much, being sometimes quite vitreous, at other times a glass filled with swarms of microliths, while in certain *pantellarites* it is a microcrystalline aggregate of quartz and alkali feldspar. The absence of plagioclase and biotite are marked distinctions between these rocks and the rhyolites, together with the scarcity of quartz and the prevalence of soda-bearing pyroxenes and amphiboles. Comendites are practically identical rocks. They occur in Sardinia, Corsica, British East Africa, East Siberia, West Texas and the East Indies.

Among the Palaeozoic volcanic rocks of Germany there is a group of lavas, the quartz-keratophyres, which are of acid composition and rich in alkali feldspar. Their dominant alkali is soda; hence their feldspars are albite and cryptoperthite, not sodicline as in rhyolites. Quartz occurs sometimes as corroded phenocrysts, but is often scarce even in the ground-mass. Porphyritic biotite or augite are very rare, but occur in the matrix along with feldspars and quartz. Micropegmatite is not infrequent in these rocks, and they may be silicified like the rhyolites. As quartz-keratophyres mostly occur in districts where there has been a good deal of folding, they are often crushed and more or less sericitized. They are best known from the Devonian rocks of Westphalia and the Harz, but are also found in New South Wales, and similar rocks have been described (as soda-felsites) from Ireland. The rocks which they accompany are usually dolerites and spilites.

Composition.—The following analyses show the composition of some of the principal types of rhyolites:—

	SiO ₂	Al ₂ O ₃	Fe ₂ O ₃	FeO	CaO	MgO	K ₂ O	Na ₂ O	H ₂ O
I.	76.34	13.22	1.93	1.85	0.21	3.67	2.84	0.61	
II.	72.15	13.50	3.12	0.93	0.16	4.54	4.20	0.85	
III.	77.59	12.75	0.67	n.f.	0.04	0.16	3.99	2.56	1.54
IV.	67.48	9.70	7.42	2.22	1.45	7.77	2.94	7.21	0.96
V.	70.97	13.84	3.21	0.78	1.20	0.20	1.57	6.27	0.74
VI.	74.79	12.60	3.50	0.19	0.07	0.18	4.92	4.35	0.64

- I. Rhyolite, Telki Banyas, Hungary.
- II. do. Mafahid, Iceland.
- III. do. Omahu, New Zealand.
- IV. Pantellarite, Pantellaria.
- V. Quartz-keratophyre, Muhlenthal, Harz.
- VI. Comendite, Sardinia.

We note in the rhyolites I–III, the very high silica, with alkalis and alumina also in considerable amount, while lime, magnesia and iron are very low. In the *pantellarite*, keratophyre and comendite the silica tends to be less abundant, while the alkalis, especially soda, increase; they have less alumina but are richer in iron and magnesia. It is easy to see why the latter types contain less quartz, feldspars often very rich in soda, and ferric minerals which contain iron and alkalis in notable amounts such as aegirine, riebeckite and arfvedsonite.

RHYTHM, a certain swing or balance in bodily movement, music, verse or prose; often extended by metaphor to apply in other spheres (e.g., "rhythm of life"). The early critic of prosody, Aristoxenus (c. 320 B.C.), distinguished three elements in rhythm—the speech (*lógos*), the melody (*mélōs*) and the bodily motion (*kinēsis somatikē*); but the latter tendency has been to separate these elements, and to emphasize more and more the distinction between them. Precision, however, has hardly yet been reached; and there are few subjects on which opinions, even among experts, differ more widely. In a short article it will be necessary to make controversial statements without defending them by argument.

Rhythm in Verse.—The line between rhythm and metre is hard to draw. Aristotle is very vague on the question: Suidas says that rhythm is the father of metre, and Quintilian that rhythm is male and metre female. Such sayings merely prove the difficulty of measuring a delicate instinct by rule of three. It would appear, however, that to the Greeks metre was concerned with the measurements of poetic periods, and rhythm with their effective chanting or recitation; it cannot therefore have depended largely on *ictus* or stress, and the word is therefore often applied to prose as well as to verse. It is probable that, in a quantitative language like Greek, this stress (as it is in modern French) was far less strongly marked than (e.g.) in English; but it is a mistake to think it entirely absent, as, conversely, it is a mistake to think that in English, though accent is, of course, predominant, quantity is unimportant.

As Schipper says, "in English long and short syllables have no constant length, no constant relation; they depend on the context. They do not *determine* rhythm, but they help to *regulate* it." No rigid laws, therefore, can be laid down as to the proper employment of rhythmic balance. A subtle *feeling* must govern the periodic progress of sounds in harmony with the emotions it is desired to express. When the ear is satisfied, we feel that the rhythm is adequate; and a very brief study will show us that the ear demands different rhythms for an expression of different emotions. The genius of the poet is, on this side, revealed by the unforced skill with which he selects the appropriate rhythm. Ecstasy, e.g., takes a quick, eager, rising movement; sadness is full, slow and emphatic; meditation deliberate; mystery and suspense are faint, languorous and throbbing; often, indeed, the rhythm is so intimately linked with human feeling that no analysis can disentangle them.

Pauses, again, are an almost essential element in modern rhythm. In Shakespeare and Milton, e.g., a pause may take the place of a whole beat; and the right use of such pauses often lends a variety which increases the beauty of a passage. Still more important is what has been called the "free musical paragraph," of which Milton, in *Paradise Lost*, is so consummate a master. Here the balance, overstepping the limits of the verse-form, and felt over wide spaces, is perhaps the chief glory of the poet's style; and the skill with which one "paragraph" is set against another forms, so to speak, a larger rhythm containing and holding up the smaller rhythms of the single paragraphs and of the verse-form. In rhymed verse this larger rhythm is represented by the progression of the stanza in itself, and by the linking of the stanzas into harmonious wholes. Thus in the full meaning of the term, rhythm depends at least as much on the orderly arrangement of the thought as on the balance of the words.

Rhythm in Prose.—We perceive then that there is a rhythm in prose no less than in verse; and this appears not only in the balance of the sentence, but in the arrangement of the sentences in paragraphs and in the building up of paragraphs into chapters. Here, as in everything else, the art must be concealed. A mechanical, epigrammatic balance, like that of Johnson, is too obvious, and ere long tends to weary. The truly rhythmic prose-writer satisfies at once the ear and the mind as a skilled dancer satisfies at once the ear and the eye, without drawing attention to the means by which the effect is attained.

On the special laws of rhythm in the poetry of different nations—Greek, Hebrew, Old English, and the like—it is impossible to speak here; the works of scholars should be studied.

RHYTHM IN MUSIC

Like all artistic categories musical rhythm must be studied historically, to avoid Philistinism towards the rhythms of early periods. But the musical rhythms of the 18th and 19th centuries are so much more familiar to us than any others, and so radically different from speech-rhythms, that we shall do well to analyse them first. Their true relation to speech-rhythms will then become much clearer, and the study of older rhythms will be greatly simplified.

1. Body-rhythm and Speech-rhythm.—These are two pre-historic elements in musical rhythm; and in modern music they are in equipoise, though apart from music they are incompatible. Dance-rhythm is too narrow a term for the one, and speech-rhythm is a satisfactory term for the other. We may coin the term *body-rhythm* as giving the necessary extension to the notion of dance-rhythm. Musical *body-rhythm*, even in the slowest paces, is enormously stronger than anything known to prosody. It is no exaggeration to say that it is as strong as the pace of a horse. Not even Browning could have recited "How they brought the good news from Ghent to Aix" with comfort while riding a galloping horse; but Schubert's Characteristic Marches (Op. 121) do not merely imitate that pace but go far to stimulate it if played to a body of cavalry. Gentler rhythms may be less immediately understood, but, once grasped, are not more easily changed. The music must brace itself up for any abrupt change of its fundamental rhythm. But that fundamental rhythm may be very slow and lie very deep.

In the example on p. 274 (Ex. 1), Haydn uses an underlying rhythm of thrice two beats. The beat is a quaver, for which one second is not too slow a tempo for this particular composition. Its whole group of six beats is invariably 3+2 and never 2+3. In this kind of music change from the one division to the other would be impossible without either violence or vagueness; unless it were a permanent change of metre. So important is the notion of 3+2 that it is not counted as 6 at all, but as 1 & 2 & 3, etc. Of these beats the first bears the chief stress, the second and third bear less, and there is no rule to give either more stress than the other. We are not, at present, considering the case of three beats quick enough to mark the rhythm without subdivision. Obviously the subdivisions (counted by "&") have no accent, except in relation to their own further subdivisions. Musical rhythms are measured from accent to accent; and of pairs of accents the first is stronger than the second. In larger groups, if the rhythm is binary the third accent will be stronger than the second, but not as strong as the first or fifth. At a very quick pace the difference of strength between the first accent and the fifth may become perceptible, but the rhythm would be inartistically stiff if such distinctions were not soon obliterated.

Triple rhythm, whether slow and subdivided or quick and undivided, also falls readily into larger binary periods with the same relative strengths of accent. There is nothing to prevent it from falling into ternary periods, but the mind ceases to apprehend a high power of three rhythmically, for we cannot know that the third period of a slow group is not the first of a new pair.

On these data it is now possible to analyse the rhythm of Ex. 1. It begins on the main accent, with no anacrusis. Between the first and second quaver beats there is a group of grace-notes. In actual time these should come on the second quaver and reduce the length of the second main note instead of that of the first, but they have no accent, and the second main note has its due stress and is not noticed to have arrived late, even if the grace-notes have been taken with some deliberation. They are like the consonants in the word *three*: it is easy to pronounce the word at a given moment, and nobody thinks of dividing it as thr-ee, though the consonants really take an appreciable time.

During the second bar of six beats the accompaniment (not given here) takes its cue from the melody and divides the quaver-beats by 3 (and the crotchets by 6). This motion thereafter pervades the whole composition, sometimes in the melody, and

levelled into an even series of fourteen notes a second, the rhythmic effect would be appreciably different, though the actual difference of pace would be only $\frac{1}{14}$ of a second.

The special sign for triplets is readily adapted to other subdivisions. In most cases such adaptation is not meant to produce abstruse rhythms, but to secure an effect of free declamation. Freedom is as necessary in music as it is in speech; but fine playing, whether in obvious *tempo rubato* or in apparent strictness, bases this freedom on the superlative accuracy of good rhythmic notation.

3. *Tempo*.—The time-signature tells us nothing about the pace of the music, for the choice of the denominator is determined by a tangle of historic associations, so that $\frac{3}{4}$ may mean (as in Beethoven's C minor concerto) the slowest movement ever written, and $\frac{3}{4}$ may be a scherzo-tempo in which only one beat in a bar is countable.

The sense of tempo is a larger aspect of the body-rhythm, and in classical music it is very steady. A fundamental law of all musical rhythm is that a hurrying or slackening of tempo has no power to alter the rhythmic organization. If your phrase is too short a *ritardando* will not make it aesthetically any the longer; nor will an *accelerando* get rid of a redundant bar. On the contrary, it is crowded detail that will best profit by slackening, and loose-knit passages that have most to gain by an unobtrusive mending of the pace.

The genuine *tempo rubato* is, as its name implies, a rhythmic robbing of Peter to pay Paul. Chopin said that his left hand conducted in strict time while his right declaimed freely. The truth is that sound is as full of illusions as sight. One such illusion has already been illustrated by the grace-notes of Ex. 1, and other illusions are of much the same kind. The tick of metronome measures average time-intervals; and if it is set to measure a naturally rhythmic performance it will seem to hustle the player in some passages and to drag upon him in others, however carefully we select its pace.

In the classics from Bach to Brahms a movement may give more legitimate scope for *tempo rubato* than some purists care to admit, but it will not drift from one tempo to a radically different tempo, unless towards the end, or as evidence of imminent break-up. The gradual drift from one tempo to another first becomes something better than a weakness when the whole nature of musical movement becomes capable of continuity over hours, as in Wagnerian opera. Then, and not before, can we view one and the same tempo from opposite directions. Thus, in *Tristan und Isolde* the last part of the love-duet in the second act is a quick movement in $\frac{3}{4}$ time. *Isolde's Liebestod* ends the opera with an exact recapitulation of this (differing only in the voice part and absolutely unaltered in the orchestra) in rather slow $\frac{3}{4}$ time. By metronome the two tempi should be identical, though the impulse in the duet is energetic and that of the *Liebestod* reposeful. Wagner merely feels that the broader notation better suits *Isolde's* dying vision; and the listener, who may know and care nothing about the notation, agrees with Wagner.

Ex. 2 Adagio

Dal-la sua pa-ce la mia di-pen-dè

It is partly a question of accent and comes under the heading of phrasing.

4. *The Rhythm of Classical Music in Relation to Poetry*.—We can now return, furnished with new criteria, to the relation between musical and poetic rhythm. Even a simple musical setting of poetry will stretch the words in ways which speech does not normally admit. The naive poet will unhesitatingly accept this as in the nature of singing. Only the half-baked musical *litterateur* objects, when Mozart makes Ottavio sing *Dalla sua pace la mia dipende* (Ex. 2) five times as slowly as any speaker could naturally utter the words, and then puts the top note and chief accent on the

unimportant *la*. The poet would be glad to sing it that way if he could. It is quite good Italian prosody to give a nearly equal stress to *la* and *mia*: and the climax on *la* is more than counterbalanced by the fact that the important word *mia* falls on a harmonically sensitive note. The grammatical sense might have been clearer if a similar but slighter emphasis had been given to *sua*. But Ottavio is not giving instructions to a servant, but expressing his inmost feelings in solitude. Language does not base its emotional accents on logical analysis. Dr. Johnson corrected a clergyman for saying "Thou shalt not steal" instead of "Thou shalt not steal." If Johnson was right, how in the world did "shall not" ever become "shan't"?

The sensitive note on *mia* shows one of the four main degrees of freedom in musical accent. There is first the normal time-accent. Many critics of musical declamation seem to know no other forms of stress; but it can be completely eclipsed by putting the highest note of the melody elsewhere. The highest note can in its turn be eclipsed by the longest note. And in Ex. 2, both together are eclipsed by the most sensitive note. Moreover, and without recourse to anything so drastic as syncope, the weakest note in the phrase may be given a special accent stronger than a main beat. This is beautifully shown in the third bar of Ex. 1, where the accented *Ep*, normally quite the weakest note in the bar, could certainly bear the chief syllable in a sentence if words for Haydn's wonderful rhythm could be found at all. Lastly, such a displaced accent may have a double meaning, the note retaining its original lightness in spite of its borrowed stress. Weber has been blamed for his bad declamation in the following famous passage:—

Ex. 3

Weber, *Der Freischütz*, Act II.

Trübe Augen, Liebchen, taugen, etc.

But, by your leave, this is a triumph of musical gesture. The lively Annenchen might even point a playful finger at the anxious Agathe with each false accent that Weber so explicitly marks. Meanwhile the orchestra corrects the declamation in waltz-rhythm.

By the interplay of these varieties of accent the strophic song, with the same tune to several stanzas, condemned as lary and low by our prose critics of music, becomes, as Brahms always maintained, the highest achievement of a song-writer. The interplay does not annihilate right and wrong in declamation, nor does it prove that the classics are infallible; but it forms a musical technique as disciplined as prosody and as unlike prose. In such ways artistic factors reconcile their conflicts, and without such conflicts there is neither art nor life. Wagner and Wolf are perfect masters of a musical declamation that follows the rules of prose; but when we are told that there are no other rules, and that the classics from Bach to Brahms merely blundered insensitively, it is time to point out that musical rhythm cannot be learnt from a bell-metronome nor poetry from a pronouncing dictionary.

Let us now try a few experiments in setting blank verse to music. The first step will be to find a constant musical rhythm to represent the average line. This average rhythm will horrify the poetic ear if it is put forward as a specimen of blank verse, and probably if a line could be found that fitted it exactly that line would be a very ugly one. Still, the fact remains that the musician's average idea of blank verse is accurately represented by the following scheme, which represents two lines:

Ex. 3a

etc.

Now read the first paragraph of *Paradise Lost* rigidly to this scheme at the rate of two syllables to a metronome-beat of 80 to the minute. You will not satisfy the poet's ear; but you will find

that the lines accommodate themselves better to this than to any other uniformity; that extra syllables can be managed by grace-notes, and that the interval of two quavers between each line is a natural part of the scheme. We can proceed thus for eight lines, with rheumatic pains but not complete disaster. The imperative "Sing" is a heavy word to put into anacrusis, even of double length, and our three main beats must override many accents in lines that so often have four. Also the interlinear pause of two beats is irksome when the sense runs on. In the ninth line we must alter the scheme, for no anacrusis can digest any part of "In the beginning." So we must "invert" the first foot thus:—

Ex. 3b

In the be - gin - ning, how the Heav'ns and Earth

But before we condemn the scheme let us see how far the torture is mitigated by merely adding musical rise and fall:—

Ex. 4
Adagio

Of Man's first dis - o - be-di-ence and the fruit Of
that for - bid - den tree, whose mor - tal taste Brought
death in - to the world and all our Woe, With
loss of E - den, till one great - er Man Re-
store us and re - gain the bliss - ful seat Sing
heav-en-ly Muse that on the se-cret top Of O - reb, etc.

Blank verse has been worse recited than this. The rigid musical timing proves unexpectedly flexible already; and the rubato of a good singer can go far to improve it without becoming vulgar.

Now let us legalize the singer's rubato, and, without altering the two-quaver intervals between the lines, help the *enjambement* by a pianoforte accompaniment that makes the ear expect the resolution of a discord. Sensitive harmonies will further aid the rhythmic sense. The $\frac{3}{4}$ notation is now becoming troublesome; so that bars are divided into three and the lengths of the notes doubled. But the original $\frac{3}{4}$ scheme is nowhere violated. (See Ex. 5.)

After this point any attempt to continue this literal interpretation of the metre would make the music drag hopelessly. Already the first two lines would be the better for running over the pause and doubling the pace of "that forbidden tree." But this would mean using two time-scales and would take us into free composition. The object of this illustration is not to show how these words ought to be set, nor to prove the very doubtful proposition that they are singable to any kind of music; but simply to bring out the most elementary relations between music and verse.

5. **Phrasing.**—The higher art of phrasing is chiefly observable in groups of very much simpler bars than those of our illustra-

tions so far. Two facts, often ignored, must be realized before we can understand phrasing at all. First, music, being in time and not in space, is never apprehended in a *coup d'oeil*, but always in a momentary present comprehending a remembered past with an imperfectly anticipated future. Consequently we miss half the aesthetic values of rhythm if we insist on knowing all about it from the first note. Rhythms have as much right to change their meaning while we listen to them as the cats of Wonderland have to grin; and "they all can and most of them do."

The second point is that the bar represents no fundamental rhythmic fact. It did not come into existence so long as music was printed only in parts. When music began to be printed with all the parts ranged legibly on one page, it was necessary to score the pile of parts with vertical strokes to range them in partitions and guide the eye. Hence the word *score*, and the French *partition* and German *Partitur*. The nascent body-rhythm grew stronger and gradually made it convenient that the bars should coincide with the groups indicated by the time-signature, and this gave rise (but only in recent times) to the delusion that the bar was the permanent unit. It is often obviously not so. When Mozart writes in moderate common time his phrasing is sure to make an odd number of half-bars somewhere so that a theme that originally lay on 1, 2, 3, 4, now lies on 3, 4, 1, 2. In such a case it is pedantic to say that the accent has changed and still more pedantic to blame Mozart for not either taking shorter bars throughout or changing to them according to the rhythm. If the half-bar displacement is really awkward Mozart will put it right, as when he rebared the duet "Bei Männern welche Liebe fühlen" in *Die Zauberflöte*. But long bars imply delicate accents and these accents become no harder when the phrasing contracts.

Beethoven writes his scherzos, and some very powerful other movements, in the shortest possible bars, and it is often difficult to tell whether the first of such bars is a main accent or an anacrusis. In the first movement of the C minor sonata (op. 10, No. 1) when we reach bar 22 it becomes manifest that bar 9 must have been in anacrusis; but we cannot have noticed that at the time, for when theorists go back to bar 1 and say that that initial bump was in anacrusis we can only smile. In three late works Beethoven helps the players by the words *Ritmo di tre battute* and *Ritmo di quattro battute*. The most famous of these passages is in the scherzo of the ninth symphony. Why did Beethoven not use there $\frac{4}{4}$ or $\frac{3}{4}$ bars so that his *ritmo di tre battute* became self-evident as a change to $\frac{4}{4}$? Because if you wish to ride this Pegasus you must please to rise on your stirrups once in Beethoven's bar, and not only once in 3 or 4. The change to 3-bar rhythm is obvious enough; but the return to 4 is not, as Grove said, effected by the drums, but comes where nobody can possibly detect it. And Beethoven, having helped the conductor at this point, is quite content, as in earlier works *passim*, that the listeners should gradually become aware that the 3-bar swing is no longer in being. In the trio, Beethoven wishing to indicate that 2 of its crotchets correspond to 3 of the scherzo, first wrote in $\frac{4}{4}$ time. But this made the lilt as unrecognizable as the true proportions of Iceland at the top of a map on Mercator's projection. So he changed it to alla-breve bars $\frac{3}{2}$.

The common sense of the whole matter is that hard accents and soft accents are equally liable in the long run to obliterate the distinction between the first and the third of four beats, and may go far to weaken that between the first and the second. We shall never find that Beethoven's short bars will fit any one interpretation throughout a piece, nor shall we often be able to fix the point at which the rhythmic angle is shifted. And when we have fixed everything some overlap will upset us or some extra bar make us hold our breath. Four-bar rhythm is more important to music than limericks are to literature, but the limerick is hardly more adequate or historically qualified to be taken as the fundamental basis for rhythm. And we must not take a lofty timeless view of rhythmic inequalities and changes. Farmer Giles is mistaken in the idea that the lady he finds sketching in the woods where you can't see round the corner would find a better subject on the top of a hill where you can see six counties.

Ex. 5 Andante con moto $\text{♩} = 54$

6. **Older Musical Rhythms.**—In measuring the distance between the musical rhythms, the most familiar to us and those of the 16th and earlier centuries, the first thing we must dismiss is our strong body-rhythm. Only the lightest ballets and fa-las of our great madrigalists have any such element. The greater part of

about as strongly as in modern music, but it is already very much weakened with pairs of semibreves. Examine the first two lines of Palestrina's *Stabat Mater*, which is as wonderful in rhythm as it is in harmony.

The music of the second line is identical with that of the first, and both lines are an exact quantitative rendering of the verses, with longs twice the size of shorts. The time signature tells us that the breve contains 2 semibreves and the semibreve two minims. Accordingly the modern editor draws bar strokes at regular breve-distances throughout the score. Then comes the modern choir master, warm from a rehearsal of *Be Not Afraid in Elijah*, and beats four in a bar, down, left, right, up, while the dutiful double choir sings

Ex. 6

Chorus I

Chorus II

the 16th century polyphony is held together by a time system which merely counts semibreves and settles whether the semibreve is to be *perfect* and equal to 3 minims or *imperfect* and equal to 2, and also whether three or only two semibreves are to go to a breve. The law of accent holds with pairs of minims

Sta-bat	Ma-ter do	(sniff) lo ro	Sa jux
1 2 3 4	1 2 3 4	1 2 3 4	1 2 3 4

Ta cru	Cem la (sniff) cry	mo sa
1 2 3 4	1 2 3 4	1 2 3 4

But now let each singer, at a starting signal from the conductor, merely move one finger regularly up and down in minims, downwards for accented beats and upwards for unaccented. It will then be found perfectly easy to override these gentle accents whenever the dense dicates, and the choir will find itself declaiming the words beautifully.

Ex. 6a

If bars must be drawn let them come only where there is a normal accent. We must not put a bar line after *mater*, because this would come in the middle of a semibreve, or, as Morley calls it, a stroke. The examples of Victoria and Josquin given in the articles MASS; MORLEY and MUSC are barred freely by these rules, but no such single scoring is adequate for an elaborate

ing of which first appears later in the course of the music, nor with the case of an intentional vagueness. Nor, to return to the 16th century, must we put the unanimous speech-rhythm syncope of Ex. 6 into the same category as those of the tenor at the end of Ex. 7.

Triple time in the 16th century was very different from what it is in music with a strong body-rhythm. For one thing, it continually obliterates the difference between 2+3 and 3+2, as in example 8 by Lasso.

This swing from 3 to a 3 twice as slow is called *hemiele* and survives as late as Bach and Handel. Thus, in the first chorus of *The Messiah* the hemiele which Handel always uses in triple-time closes gives the cadential accentuation:

Ex. 8a

Ex. 7

polyphony. Ex. 7 gives a passage from Victoria's *O quam gloriosum* in full score barred so as to display what cannot be shown in the short score given with MORLEY.

From this we can see Victoria's Miltonic art of finishing a big paragraph. The lower voices enjoy their own rhythms until the slow swing of the soprano draws the bass along with it. Then the alto joins, and the tenor is compelled to regard his own rhythm as a syncope against this majority.

Little has been said so far about syncope, and little now remains to be said. Its main point, even in the 16th century, as

The opposite swing from $\frac{3}{4}$ to $\frac{4}{4}$ with a curious bump in the last () bar, characterizes the French courantes of Couperin and Bach.

Before Palestrina we find in England a fairly steady slow triple time (3 divided by 2 or 4) in Tallis; but a little earlier we find Obrecht writing music which abounded in amazing complexities, such as three depths of triple rhythm:—

Ex. 8b

The complexity is illusory, for the ear makes nothing of it, and the same is the case with the capacity of the ancient time-system of mode, time and prolation to multiply triple rhythms up to 27 beats. The fact that the process was by multiplication shows at once that no real rhythmic effects are concerned, and that the system is only a device by which the long-suffering tenors may count out the enormous notes of some unrecognizable *canto fermo*. If we want genuine highly compound times we must leave these multiplication tables and study the last movement of Beethoven's sonata Op. 111, where the theme and first variation are in triple time divided by 3 ($\frac{3}{4}$); the second variation divides the half-beat by 3, producing $\frac{3}{8}$ (which Beethoven misnames $\frac{3}{16}$); the

Ex. 8

Ex. 7 shows, is that it requires a strong body-rhythm to contradict. A common fallacy of self-centred composers is to write syncope that never encounter opposition at all. We must not confuse this with the legitimate case of a rhythm the mean-

Ex. 9

Alla tedesca

third variation divides the quarter-beats, producing $\frac{3}{4}$ (misnamed $\frac{3}{8}$); and the fourth variation returns to $\frac{3}{4}$ time and divides it by a uniform triplet vibration of 27 notes to a bar, afterwards surmounted by the unmeasured vibration of a trill. All this is sublime in its cogent clearness.

Genuine complexity was achieved by Palestrina in the second Kyrie of his *Missa "L'homme armé,"* a work as beautiful as it is ingenious. But Mozart achieved something unsurpassed in the ballroom scene in *Don Giovanni*, putting his vigorous body-rhythms to the supreme test of making the characters actually dance and pass remarks in them.

7. **Recent Rhythmic Developments.**—Rhythms other than binary and ternary cannot develop a very strong ictus, though Holst manages in the ballet of *The Perfect Fool* to make some good dance-rhythms of $\frac{3}{4}$. But they tend to flow like speech-rhythms, and they are very reluctant to change their pattern. A rhythm of 5 falls into either 3+2 or 2+3. The famous 5-time movement in Tchaikowsky's *Pathetic* symphony is 2+3 and is in absolutely square 8-bar rhythm throughout. Again 7-time will be some form of 4 and 3, or will suggest 8 with a beat divided. Ravel, in his pianoforte trio, showed that it is possible to divide 8 into 3+2+3 so inveterately that no listener can possibly hear it as 4+4. The effect is excellent, and other versions of it are used in a much quicker tempo and with more variety by Holst in his *Fugal Overture*. But we must call things by their right names and not say that a thing is complex when it clings like grim death to its one pattern and falls into phrases of 2+2 for pages together.

The *Pantomime* of Ravel's trio blends an impish $\frac{3}{4}$ with a sanctimonious $\frac{3}{4}$ very amusingly. An early pianoforte sonata by Cyril Scott attempts to get away from all regularities. Its 13s and 3s do not always succeed in avoiding straightening out into plain 16=4x4; and when successful are conscientious rather than impulsive. The rhythms of Greek tragedy, interpreted syllabically, are suggestive, and so are many oriental rhythms. But they are not body-rhythms; and it may be doubted whether any great increase in variety of strong body-rhythms is imminent at present.

RHYTHINA: see SEA COW.

RIAL. The monetary unit of Persia (Iran), which has a paper currency mainly. There are notes of 5, 10, 20, 50, 100, 500 and 1,000 rials issued by the Bank Melli Iran and subsidiary coins of copper and bronze for 5, 10 and 50 dinars (1 rial=100 dinars). Authority was given in Dec. 1943 for the minting of 1, 2, 5 and 10 rial coins from an alloy containing 60% silver and 40% copper. Fixed rates of exchange are maintained by virtue of the foreign exchange control law of 1936. The sterling value of the rial in 1944 was slightly under 2d., the rate of exchange being fixed at 128-130 in accordance with the currency law of Nov. 19, 1942, which also provided for the retention of a 60% reserve of gold

and silver against the first 3,500,000,000 rials in circulation and a reserve of 100% in gold or foreign exchange convertible into gold against any circulation in excess of this figure. The circulation on April 20, 1944, was 6,035,000,000 as compared with approximately 800,000,000 in the years 1936-38. (N. E. C.)

RIAZ PASHA (c. 1835-1911), Egyptian statesman, was born about 1835. He was discovered by Ismail Pasha, who made him one of his ministers. When Ismail's financial straits compelled him to agree to a commission of inquiry, Riaz was vice-president of the commission. He filled this office with distinction, but not to the liking of Ismail.

When Ismail attempted to resume autocratic rule, Riaz fled the country. Upon the deposition of Ismail (June 1879), Riaz was sent for by the British and French controllers, and he formed the first ministry under the khedive Tewfik. His administration was overthrown by the agitation which had for its figurehead Arabi Pasha (q.v.).

On Sept. 9, 1881, Riaz was dismissed and went to Europe, remaining until the fall of Arabi. He then accepted office as minister of the interior under Sherif Pasha. He wanted the immediate execution of Arabi and his associates; and when the British insisted on clemency to the leaders of the revolt, he resigned (Dec. 1882).

Riaz took no further part in public affairs until 1888 when, on the dismissal of Nubar Pasha (q.v.), he was summoned to form a government, remaining in office until May 1891. In Feb. 1892 he again became prime minister under Abbas II. In April 1894 he finally resigned office.

Riaz died on June 18, 1911.

RIBADENEIRA, PEDRO A. (1527-1611), hagiologist, was born at Toledo on Nov. 1, 1527. In Rome on Sept. 18, 1540, he was admitted by Ignatius Loyola as one of the Society of Jesus.

He pursued his studies at Paris (1542) in philosophy and theology. Loyola, in 1555, sent him on a mission to Belgium; in pursuance of it he visited England in 1558. In 1560 he was made provincial of the Society of Jesus in Tuscany. He was transferred as provincial to Sicily in 1563, was again employed in Flanders and from 1571 served in Spain. In 1574 he settled in Madrid, where he died on Sept. 10, 1611. His most important work is the *Life of Loyola* (1572). That Ribadeneira was, though an able, a very credulous writer, is shown by his lives of Loyola's successors Diego Laynez and St. Francis Borgia; and especially by his *Vios Sanctorum* (1599-1610), a collection of saints' lives, entirely superseded by the labours of the Bollandists.

See his autobiography in his *Bibliotheca Scriptorum Societatis Jesu* (1602 and 1608, supplemented by P. Alegambe and N. Sotwell in 1676); H. F. De Puy, *An Early Account of the Establishment of Jesuit Missions in America* (1921).

RIBAUT or RIBAUT, JEAN (c. 1520-1565), French navigator, was born at Dieppe, about 1520. Appointed by Admiral

Coligny to take French Protestants to America, Ribault sailed on Feb. 18, 1562, with two vessels, and on May 1 landed at Florida at St. John's river, or, as he called it, Rivière de Mai. Having settled his colonists at Port Royal harbour (now Paris Island, S.C.), and built Fort Charles for their protection, he returned to France. In 1563 he appears to have been in England and to have issued *True and Last Discoverie of Florida* (Hakluyt Soc., vol. vii.). In April 1564 Coligny despatched another expedition under René de Laudonnière, but meanwhile Ribault's colony, destitute of supplies, revolted against their governor and attempted to make their way back to Europe in a boat which was happily picked up by an English vessel. In 1565 Ribault was again sent out to satisfy Coligny as to Laudonnière's management of his new settlement, Fort Caroline, on the Rivière de Mai. While he was still there the Spaniards attacked the French ships at the mouth of the river. Ribault set out to retaliate but his vessels were wrecked near Matanzas Inlet and he had to return to Fort Caroline by land. The Spaniards by this time had slaughtered all the colonists except a few who got off with two ships under Ribault's son. Induced to surrender by false assurances, Ribault and his men were put to the sword in Oct. 1565.

BIBLIOGRAPHY.—See E. and E. Haug, *La France protestante* (1846-59); F. Parkman, *Pioneers of France in the New World* (new ed. 1912); J. Ribaut, *The Whole and True Discoverie of Terra Florida*, a reprint of the London ed. of 1563 with notes and biography (Doland, Florida, 1927).

RIBBONFISH; see OARETISH.

RIBBONISM, the name given to an Irish secret-society movement which began at the end of the 18th century in opposition to the Orangemen (*q.v.*) and which was represented by various associations under different names, organized in lodges, and recruited all over Ireland from the lowest classes of the people.

The actual name of Ribbonism (from a green badge worn by its members) became attached to the movement later, about 1826; and after it had grown to its height, about 1835, it declined in force, and was practically at an end in its old form when in 1871 the Westminster act declared Ribbonism illegal.

RIBBONS. By this name are designated narrow webs, commonly of silk or velvet, used primarily for binding and tying in connection with dress, but also applied for innumerable useful, ornamental and symbolical purposes. Along with that of tapes, fringes and other small wares, the manufacture of ribbons forms a special department of the textile industries.

RIBBEAUVILLÉ (Rappoltswiller), a town of France, in the department of Haut-Rhin. Pop. (1936) 4,596. It lies at the entrance of the valley of the Strengbach, under the Vosges mountains, 33 mi. S.W. of Strasbourg on the railway to Basle. It is in part surrounded by ancient walls and has many mediaeval houses and two fine Gothic churches, of St. Gregory and St. Augustine. The Carolabed, a saline spring with a temperature of 64°, made Ribbeauvillé a watering-place.

Rappoltswiller, known in the 8th century as Rathaldovillare, passed from the bishops of Basle to the lords of Rappoltstein, famous nobles of Alsace. The lord of Rappoltstein was the protector of wandering minstrels. When the family became extinct in 1673 this office of king of the pipers (*Pfeiferkönig*) passed to the counts palatine of Zweibrücken-Birkenfeld. The minstrels had a pilgrimage chapel near Rappoltswiller, dedicated to their patron saint, Maria von Dusenbach, and here they held an annual feast on Sept. 8. Near the town are the ruins of three famous castles, Ulrichsburg, Girsberg and Hohnrappoltstein.

RIBEIRA, a town of northwestern Spain, in the province of Coruña, on the extreme southwest of the peninsula formed between the Ría de Muros and Noya and Arosa bay. Pop. (1940) 18,760. Ribeira is in a hilly country, abounding in wheat, wine, fruit, fish and game. Its port is Santa Eugenia de Ribeira.

RIBEIRO, BERNARDIM (1482-1552), the father of bucolic prose and verse in Portugal, was a native of Torráo in the Alentejo. He studied at the University of Lisbon, was introduced by one of his relatives to the court of King Manuel, and became secretary to King John III. In 1524. Ribeiro's early verses are to be found in the *Cançãoeiro Geral* of Garcia de

Resende (*q.v.*). He took part in the historic *Serões do Paço*, or palace evening entertainments, which largely consisted of poetical improvisations; there he met and earned the friendship of the poets Sá de Miranda (*q.v.*) and Christovão Falcão, who soon became his literary comrades and the confidants of his romantic passion for a lady who has been variously identified by literary historians. All that is certain is that the upshot of the affair was banishment from court. Ribeiro had poured out his heart in five beautiful eclogues, the earliest in Portuguese, written in the popular octosyllabic verse. He is said to have gone to Italy, and possibly was there when he wrote his moving knightly and pastoral romance *Menina e Moça*, in which he related the story of his passion, personifying himself under the anagram of "Bimnardeir," and the lady under that of "Aonia." When he returned home in 1524, the new king, John III, restored him to his former post. But his mind was already unimpaired by trouble. About 1534 a long illness supervened, then melancholia. In 1549 the king gave him a pension; in 1552 he died insane in All Saints hospital in Lisbon.

The *Menina e Moça* was not printed until after Ribeiro's death (Ferrara, 1554). It is divided into two parts, the first of which is certainly the work of Ribeiro (ed. Dr. José Pessanha, Oporto, 1891), while as to the second opinion is divided.

See Visconde Sanches de Baena, *Bernardim Ribeiro* (1895); Dr. Theophilo Braga, *Bernardim Ribeiro e o Bucolismo* (Oporto, 1897); A. F. G. Bell, *Portuguese Literature* (1922).

RIBERA, GIUSEPPE (1588-1652), called Lo SPAGNOLETTO or "little Spaniard," a leading painter of the Spanish and partly Neapolitan school. He was born at Játiba near Valencia in Spain on Jan. 12, 1588. He studied painting under Francisco Ribalta (*c.* 1551-1628), the Spanish Caravaggio, whose "tenebrosa technique" with marked contrast of light and shade, he acquired. He then proceeded to Italy. In Rome he studied Raphael's frescoes in the Vatican; in Parma Correggio's works; he probably also visited Padua and Venice. Eventually he settled at Naples, where he married Catarina Azzolino, the daughter of a painter, in 1616. His work attracted the attention of the Spanish viceroy, the duke of Ossuna, who favoured him, and whose patronage was continued by his successors, among whom was Count Monterey. For this nobleman he painted the wonderful "Conception" (1635) in the Augustine monastery of Salamanca. After 1637 he was employed on important work in the Carthusian church of S. Martino at Naples. Commissions flowed in upon Ribera. In 1626 he was elected a member of the Academy of St. Luke in Rome; he was decorated by the pope with the insignia of the order of "the Abito di Cristo" in 1644. Velasquez is said to have visited him at Naples. His influence was felt throughout Italy and Spain, and the popularity of the painters known as the *Tenebrosi* and naturalists depended as much on the example of Ribera as on that of Caravaggio. Luca Giordano was his most distinguished pupil. The close of Ribera's career was shadowed by his grief over the abduction of his second daughter by Don Juan of Austria.

Ribera was one of the most able naturalist painters, but he was also a poet. His drawing was precise and also powerful; his figures are true in form but also full of feeling, especially those of old men. In his earlier style, founded on Ribalta (some say on Caravaggio), he displays an excessive love of strong shadows. His later work was more luminous and of a rich golden tone. Pacheco rightly called him one of the great colourists of Spain. Ribera's religious pictures are free from sentimentality and essentially Roman Catholic in spirit. Owing to his realistic rendering of scenes of martyrdom of Christian saints it has been said that he delighted in subjects of horror. Thus to quote Byron: "Spagnoleto tainted his brush with all the blood of all the sainted" (*Don Juan*, XIV, 71). Among Ribera's principal works we may mention: "The Martyrdom of St. Bartholomew" (1630) in the Prado; "The Pietà" (1637) in S. Martino, Naples; "St. Agnes" (1641) in the Dresden gallery; "The Descent from the Cross" (1644) in the Neapolitan Certosa; "St. Januarius emerging from the Furnace" (1646) in the cathedral, Naples; and "The Adoration of the Shepherds" (1650) in the Louvre. He also painted mythological subjects such as "The Silenus" (1626) in the gallery of Naples and "Venus and Adonis" (1637) in the Galleria Nazion-

ale, Rome. He was the author of several fine male portraits such as "The Musician" from the Stroganoff collection now in the museum of Toronto, Canada. The Prado, Madrid, contains no less than 50 of his paintings.

As an etcher he belonged to the Italian school, and his plates all date from a late period (1621-48). They are masterpieces in direct drawing especially "the Drunken Silenus with Satyrs" (1628) and "Don Juan on Horseback" (1648). Bartsch enumerates 18 plates, of which three are studies of figures.

See C. Bermudez, *Diccionario Histórico*; Dominici, *Vite de' Pittori* (Naples 1840-46); A. L. Mayer, *Ribera* (Leipzig, 1903).

RIBOT, ALEXANDRE FELIX JOSEPH (1842-1923), French statesman, was born at St. Omer on Feb. 7, 1842. After a brilliant career at the University of Paris, he rapidly made his mark at the bar. He was secretary of the conference of advocates and one of the founders of the *Société de législation comparée*. After entering the Chamber of Deputies in 1878 he devoted himself especially to financial questions, and in 1882 was reporter of the budget. He became one of the most prominent republican opponents of the Radical party, distinguishing himself by his attacks on the short-lived Gambetta ministry. He refused to vote the credits demanded by the Ferry cabinet for the Tongking expedition, and shared with M. Clémenceau in the overthrow of the ministry in 1885. At the general election of that year he was defeated, but re-entered the chamber in 1887. After 1889 he sat for St. Omer. His fear of the Boulangist movement converted him to the policy of "Republican Concentration," and he entered office in 1890 as foreign minister in the Freycinet cabinet. He gave a fresh direction to French policy by the understanding with Russia, declared to the world by the visit of the French fleet to Cronstadt in 1891, and subsequently ripened into a formal treaty of alliance. He retained his post in the Loubet ministry (Feb.-Nov. 1892), and on its defeat became himself president of the council, retaining the direction of foreign affairs. The government resigned in March 1893 on the refusal of the chamber to accept the Senate's amendments to the budget. On the election of Félix Faure as president of the Republic in Jan. 1895, Ribot again became premier and minister of finance. On June 10 he made the official announcement of a definite alliance with Russia. On Oct. 30 the ministry fell. After the fall of the Méline ministry in 1898 Ribot tried in vain to form a cabinet of "conciliation." The policy of the Waldeck-Rousseau ministry on the religious teaching congregations broke up the Republican party, and Ribot was among the seceders; but at the general election of 1902, though he himself secured re-election, his policy suffered a severe check. He actively opposed the policy of the Combes ministry and denounced the alliance with Jaurès, and on Jan. 13, 1905, he was one of the leaders of the opposition which brought about the fall of the cabinet. Nevertheless, he now announced his willingness to recognize a new régime to replace the Concordat, and gave the government his support in the establishment of the *Associations cultuelles*, while he secured some mitigation of the severities attending the separation.

In June 1914 M. Poincaré summoned Ribot to form a cabinet. He succeeded in doing so but his Government did not survive the first ministerial declaration. He returned to office in Aug. 1914 as minister of finance in M. Viviani's reconstituted ministry of national defence. He held the same office in the ministry formed by M. Briand on Oct. 29, 1915, and again in the reduced cabinet of Dec. 1916. In March 1917 he succeeded M. Briand as prime minister and minister of foreign affairs. He gave way in Sept. of the same year to M. Painlevé, in whose Government he retained the ministry of foreign affairs, which he resigned in the following month. M. Ribot was a member of the Académie Française and of the Académie des Sciences Politiques et Morales. He died in Paris Jan. 13, 1923.

See M. Laurent, *Nos gouvernements de guerre* (1920).

RIBOT, THEODORE ARMAND (1839-1916), French psychologist, was born at Guingamp on Dec. 18, 1839, and died on Dec. 9, 1916. In 1888 he became professor of psychology at the Collège de France. His thesis for his doctor's degree, republished in 1882, *Hérédité: étude psychologique* (5th ed., 1889), is

his most important and best known book. Following the experimental and synthetic methods, he collected instances of inherited peculiarities; he pays particular attention to the physical element of mental life, ignoring all spiritual or non-material factors in man.

Of his works the following have been translated into English:—*English Psychology* (1873); *Heredity: a Psychological Study of its Phenomena, Laws, Causes, and Consequences* (1875); *Diseases of Memory: An Essay in the Positive Psychology* (1883); *Diseases of the Will* (1884); *German Psychology of to-day*, tr. J. M. Baldwin (1886); *The Psychology of Attention* (Chicago, 1890); *Diseases of Personality* (Chicago, 1895); *The Psychology of the Emotions* (1897); *The Evolution of General Ideas*, tr. F. A. Welby (Chicago, 1899); *Essay on the Creative Imagination*, tr. A. H. N. Baron (1906).

RICARDO, DAVID (1772-1823), English economist, was born in London on April 19, 1772, of Jewish origin. His father, who was of Dutch birth, was a successful member of the Stock Exchange. In 1786 Ricardo entered his father's office, where he showed much aptitude for business, but in consequence of his adoption of the Christian faith about 1793, when he married Miss Wilkinson, he was separated from his family and thrown on his own resources. He continued a member of the Stock Exchange and by 1797 was sufficiently wealthy to be able to turn to scientific pursuits; but, having read Adam Smith's great work, he threw himself into the study of political economy.

His publication of a tract on *The High Price of Bullion, a Proof of the Depreciation of Bank Notes*, in 1809, gave a fresh stimulus to the controversy respecting the resumption of cash payments, and indirectly led to the appointment of a committee of the House of Commons, commonly known as the Bullion Committee, to consider the question. The report of the committee confirmed Ricardo's views, and recommended the repeal of the Bank Restriction Act, but the House of Commons declared that paper had undergone no depreciation. In 1811 he met James Mill, who, while influencing Ricardo politically, was under obligations to him in the economic field. Mill said, in 1823, that he himself and J. R. McCulloch were Ricardo's only genuine disciples.

In 1815, when the Corn Laws were under discussion, Ricardo published his *Essay on the Influence of a Low Price of Corn on the Profits of Stock*, directed against a tract by Malthus entitled *Grounds of an Opinion on the Policy of Restraining the Free Importation of Foreign Corn*. His arguments were based on the theory of rent, which, as Ricardo admitted, had been clearly enunciated by Malthus in his *Inquiry into the Nature and Progress of Rent*, and which had earlier been stated by Anderson. In this essay are set forth the essential propositions of the Ricardian system, such as, that an increase of wages does not raise prices; that profits can be raised only by a fall in wages and diminished only by a rise in wages; and that profits, in the whole progress of society, are determined by the cost of the production of the food which is raised at the greatest expense. These ideas were afterwards incorporated in the *Principles of Political Economy*. In the field of the theory of banking and currency some of Ricardo's best work appears. His main ideas are expressed in three pamphlets: (1) *The High Price of Bullion* (1810), in which he discusses the available means of testing the value of paper money, and the power of the Bank of England to regulate the supply. (2) *Proposals for an Economical and Secure Currency* (1816), in which he elucidates the quantity theory, and pronounces in favour of a mono-metallic standard. (3) *A Plea for a National Bank* (1824), which was, in fact, an indictment of the methods of the existing bank, particularly in connection with its issue of paper money.

Ricardo's chief work, *Principles of Political Economy and Taxation*, appeared in 1817. The fundamental doctrine of this work is that, on the hypothesis of free competition, exchange value is determined by the labour expended in production. Ricardo's theory of distribution has been briefly enunciated as follows: "(1) The demand for food determines the margin of cultivation; (2) this margin determines rent; (3) the amount necessary to maintain the labourer determines wages; (4) the difference between the amount produced by a given quantity of labour at the margin and the wages of that labour determines profit." These theorems require much modification to adapt them to real life. His theory

of foreign trade has been embodied in the two propositions: "(1) International values are not determined in the same way as domestic values; (2) the medium of exchange is distributed so as to bring trade to the condition it would be in if it were conducted by barter." A considerable portion of the work is devoted to a study of taxation, which requires to be considered as a part of the problem of distribution. A tax is not always paid by those on whom it is imposed; it is therefore necessary to determine the ultimate, as distinguished from the immediate, incidence of every form of taxation. Smith had already dealt with this question. Ricardo, in developing and criticising his results, arrives at the conclusion that a tax on raw produce falls on the consumer, but will also diminish profits; a tax on rents falls on the landlord; taxes on houses will be divided between the occupier and the ground landlord; taxes on profits will be paid by the consumer, and taxes on wages by the capitalist.

Having retired from business and become a landed proprietor, Ricardo entered parliament as member for Portlaving in 1819. He contributed to bringing about the change of opinion on the question of free trade which led to the legislation of Sir Robert Peel on that subject, and made some valuable speeches on economic questions. In 1820 he contributed to the supplement of the *Encyclopædia Britannica* (6th ed.) an "Essay on the Funding System." In this besides giving an historical account (founded on Dr. Robert Hamilton's valuable work *On the National Debt*, 1813, 3rd ed., 1818) of the several successive forms of the sinking fund, he urges that nations should defray their expenses, whether ordinary or extraordinary, at the time when they are incurred, instead of providing for them by loans.

Ricardo died on Sept. 11, 1823, at his seat (Gatcomb Park) in Gloucestershire, from a cerebral affection. James Mill, who was intimately acquainted with him, says (in a letter to Napier of November 1818) that he knew not a better man, and on the occasion of his death published a highly eulogistic notice of him in the *Morning Chronicle*. A lectureship on political economy, to exist for ten years, was founded in commemoration of him, McCulloch being chosen to fill it.

In forming a general judgment respecting Ricardo, we must have in view not so much the minor writings as the *Principles*, in which his economic system is expounded as a whole. By a study of this work we are led to the conclusion that he was an economist rather than a social philosopher like Adam Smith or John Mill, for there is no evidence of his having had any but the narrowest views of the great social problems. He shows no trace of that sympathy with the working classes which is apparent in the *Wealth of Nations*; and he regards the labourer as merely an instrument in the hands of the capitalist. Ricardo's main contributions to economics relate to foreign trade, money, and paper issues and rent. He was responsible for the doctrine of comparative costs, as applied to foreign trade, a clear statement of the quantity theory, and a rather involved discussion of the nature of rent. His work suffers from ambiguity of expression, which has led to erroneous interpretations by his successors.

The criticisms to which Ricardo's general economic scheme is open do not hold with respect to his treatment of the subjects of currency and banking. These form precisely that branch of economics where the operation of purely mercantile principles is most immediate and invariable. They were, besides, the departments of the study to which Ricardo's early training and practical habits led him to give special attention; and they have a lasting value independent of his systematic construction.

Ricardo's collected works were published, with a notice of his life and writings, by J. R. McCulloch in 1846. The *Principles* were edited, with an introduction, bibliography, and notes, by G. C. K. Goner (1891), who also edited the *Economic Notes* (1923). See also *Letters to T. R. Malthus* (ed. J. Bonar, 1887); *Letters to J. R. McCulloch* (ed. J. H. Hollander, 1895); *Letters to H. Trower and Others* (ed. J. Bonar and J. H. Hollander, 1899); *Notes on Malthus' Principles of Political Economy* (ed. J. H. Hollander and T. E. Gregory, 1928). A French translation of the *Principles* by F. S. Constance, with notes by J. R. Say, appeared in 1818; the whole works, trans. F. S. Constance and A. Fonteyraud, form vol. xiii. (1847) of the *Collection des principes économiques*, with important notes. See also E. Baumstark, *David Ricardo's Grundsätze der Volkswirtschaft und die*

Besteuerung übersetzt und erläutert (1837), also J. H. Hollander, *David Ricardo* (1910) and A. Graziani, *Ricardo e J. S. Mill* (1921).

RICASOLI, BETTINO, BARON (1809-80), (*rê-kah'sô-lî*), Italian statesman, born at Broglio March 19, 1809. In 1847 he founded the journal *La Patria*, and sent to the grand duke of Tuscany a memorial suggesting remedies for the difficulties of the state. In 1848 he was for a short time gonfaloniere of Florence. As Tuscan minister of the interior in 1850 he promoted the union of Tuscany with Piedmont. Elected Italian deputy in 1861, he succeeded Cavour in the premiership. As premier he admitted the Garibaldian volunteers to the regular army, revoked the decree of exile against Mazzini, and attempted reconciliation with the Vatican; but his efforts were rendered ineffectual by the *non possumus* of the pope. He found himself obliged in 1862 to resign office, but returned to power in 1866. On this occasion he refused Napoleon III's offer to cede Venetia to Italy, on condition that Italy should abandon the Prussian alliance, and also refused the Prussian decoration of the Black Eagle because Lamarmora, author of the alliance, was not to receive it. After the French troops left Rome in 1866 he attempted to conciliate the Vatican with a convention, in virtue of which Italy would have restored to the Church the property of the suppressed religious orders in return for the gradual payment of £24,000,000. He conceded the *exequatur* to 45 bishops inimical to the Italian régime. The Vatican accepted his proposal, but the Italian Chamber proved refractory, and, though dissolved by Ricasoli, returned more hostile than before. Without waiting for a vote, Ricasoli resigned office. He died at Broglio on Oct. 23, 1880. His private life and public career were marked by a rigid austerity which earned him the name of the "iron baron."

See Tabarrini and Gotti, *Lettere e documenti del barone Bettino Ricasoli*, 10 vols. (Florence, 1886-94); Passerini, *Genealogia e storia della famiglia Ricasoli* (1861); Gotti, *Vita del barone Bettino Ricasoli* (1894).

RICCATI, JACOPO FRANCESCO, COUNT (1676-1754), Italian mathematician, was born at Venice on May 28, 1676, and died at Treviso on April 15, 1754. He studied at the University of Padua, where he graduated in 1696. His authority on all questions of practical science was referred to by the senate of Venice. He corresponded with many of the European savants of his day, and contributed largely to the *Acta Eruditorum* of Leipzig. He was offered the presidency of the academy of science of St. Petersburg (Leningrad), but he declined, preferring the leisure and independence of life in Italy. Riccati's name is best known in connection with his problem called Riccati's equation, published in the *Acta Eruditorum*, Sept. 1724. A very complete account of this equation and its various transformations was given by J. W. L. Glaisher in the *Phil. Trans.* (1881).

His works were collected and published by his sons (1758, 4 vols.).

RICCI, MATTEO (1552-1610), Italian missionary to China, was born of a noble family at Macerata in the March of Ancona on Oct. 7, 1552. After some education at a Jesuit college in his native town he went to study law at Rome, where in 1571, in opposition to his father's wishes, he joined the Society of Jesus.

In 1577 Ricci and other students offered themselves for the East Indian missions. Ricci, without visiting his family to take leave, proceeded to Portugal. His comrades were Rudolfo Acquaviva, Nicolas Spinola, Francesco Pasio and Michele Ruggieri, all afterwards, like Ricci himself, famous in the Jesuit annals. They arrived at Goa in Sept. 1578. After four years spent in India, Ricci was summoned to the task of opening China to evangelization.

Several fruitless attempts had been made by Xavier, and since his death, to introduce the Church into China, but it was not till the arrival at Macao of Alessandro Valignani on a visitation in 1582 that work in China was really taken up. For this object he had obtained the services first of M. Ruggieri and then of Ricci. After various disappointments they found access to Chow-king-fu on the Si-Kiang or West River of Canton, where the viceroy of the two provinces of Kwangtung and Kwangsi then had his residence, and by his favour were able to establish themselves there for some years. Their proceedings were very

cautious and tentative; they excited the curiosity and interest of even the more intelligent Chinese by their clocks, their globes and maps, their books of European engravings, and by Ricci's knowledge of mathematics, dialling and the projection of maps. Eventually troubles at Chow-king compelled them to seek a new home; and in 1589, with the viceroy's sanction, they migrated to Chang-chow in the northern part of Kwangtung, not far from the well-known Meiling Pass.

During his stay here Ricci was convinced that a mistake had been made in adopting a dress resembling that of the bonzes, a class who were the objects either of superstition or of contempt. With the sanction of the visitor it was ordered that in future the missionaries should adopt the costumes of Chinese literates, and, in fact, they before long adopted Chinese manners altogether.

Chang-chow, as a station, did not prove a happy selection, but it was not till 1595 that an opportunity occurred of travelling northward. For some time Ricci's residence was at Nan-changfu, the capital of Kiang-si; but in 1598 he was able to proceed under favourable conditions to Nanking, and thence for the first time to Peking, which had all along been the goal of his missionary ambition. But circumstances were not then propitious, and the party had to return to Nanking. The fame of the presents which they carried had, however, reached the court, and the Jesuits were summoned north again, and on Jan. 24, 1601, they entered the capital. Wan-li, the emperor of the Ming dynasty, in those days lived in seclusion, and saw no one but his women and the eunuchs. But the missionaries were summoned to the palace; their presents were immensely admired, and the emperor had the curiosity to send for portraits of the fathers themselves.

They obtained a settlement, with an allowance for subsistence, in Peking, and from this time to the end of his life Ricci's estimation among the Chinese was constantly increasing, as was at the same time the amount of his labours. Visitors thronged the mission house incessantly; and inquiries came to him from all parts of the empire respecting the doctrines which he taught, or the numerous Chinese publications which he issued. As head of the mission, which now had four stations in China, he also devoted much time to answering the letters of the priests under him, a matter on which he spared no pains or detail. In May 1610 he broke down, and after an illness of eight days died on the 11th of that month.

Ricci's work was the foundation of the subsequent success attained by the Roman Catholic Church in China. When the missionaries of other Roman Catholic orders made their way into China, twenty years later, they found great fault with the manner in which certain Chinese practices had been dealt with by the Jesuits. The controversy burned for considerably more than a century with great fierceness. (For a list of the controversial works see Cordier, *Bibliographie de la Chine*.)

Probably no European name of past centuries is so well known in China as that of *Li-ma-tseu*, the form in which the name of Ricci (*Ri-cchi Mat-teo*) was adapted to Chinese usage, and by which he appears in Chinese records. The works which he composed in Chinese are numerous; a list of them (apparently by no means complete, however) will be found in Kircher's *China Illustrata*, and also in Abel Rémusat's *Nouveaux Mélanges Asiatiques* (ii. 213-15).

The chief facts of Ricci's career are derived from the account brought home by P. Nicolas Trigault, *De Expeditione Christiana apud Sinas Suscepit ab Soc. Jesu*, extracted from Ricci's commentaries and published at Augsburg and at Lyons. (H. Y.; X.)

RICCOBONI, MARIE JEANNE (1714-1792), née Laboras de Mézières, was born at Paris in 1714. She married in 1735 Antoine François Riccoboni, a comedian and dramatist, from whom she soon separated. She herself was an actress, but did not succeed on the stage. Her works are examples of the novel of "Sensibility," and the nearest English parallel to her work is to be found in the work of Henry Mackenzie (*q.v.*). *Lettres de mistress Panny Butler* (1757); the remarkable *Histoire du marquis de Cressy* (1758); *Milady Juliette Catesby* (1759-1760), like her other books, in letter form; *Ernestine* (1798), which La Harpe thought her masterpiece; and three series of

Lettres in the names of Adelaide de Dammartin (comtesse de Sancerre) (2 vols., 1766), *Elisabeth Sophie de Vallière* (4 vols., 1772), and *Milord Rivers* (2 vols., 1776) were among her works. Deprived by the Revolution of her small pension from the crown, she died on Dec. 6, 1792, in great indigence.

See Julia Kavanagh, *French Women of Letters* (2 vols., 1862), where an account of her novels is given; J. Fleury, *Mariages et le mariage* (1881); J. M. Quérard, *La France littéraire* (vol. vii., 1835); and notices by La Harpe, Grimm and Diderot prefixed to her *Oeuvres* (9 vols., 1845); E. A. Crosby, *Une Romancière oubliée, Mme. Riccoboni* (1926).

RICE, EDMUND IGNATIUS (1762-1844), Irish philanthropist, founder of the "Irish Christian Brothers," was born at Westcott, near Callan, Kilkenny, on June 1, 1762. He abandoned his provision merchant business to devote himself to education and in 1808 he and nine others, meeting at Waterford, took religious vows from their bishop, assumed a "habit" and adopted an additional Christian name, by which, as by the collective title "Christian Brothers," they were thenceforth known. Schools were established in Cork (1811), Dublin (1812), and Thurles and Lime- rick (1817). In 1820 Pope Pius VII. issued a brief sanctioning the order of "Religious Brothers of the Christian Schools (Ireland)," the members of which were to be bound by vows of obedience, chastity, poverty and perseverance, and to give themselves to the free instruction, religious and literary, of male children, especially the poor. Rice held the office of superior general of the order from 1822 to 1838. He died on Aug. 29, 1844.

RICE, JAMES (1843-1882), English novelist, was born at Northampton on Sept. 26, 1843. Educated at Queens' college, Cambridge, where he graduated in law in 1867, he was called to the bar at Lincoln's Inn in 1871. In the meantime (1868) he had bought *Once a Week*, which proved a losing venture for him, but which brought him into touch with Walter Besant, a contributor. (See Besant's preface to the Library Edition [1887] of *Ready-money Mortiboy*.) There ensued a close friendship and a literary partnership between the two men which lasted ten years until Rice's death. The first of their joint works was *Ready-money Mortiboy* (1872), dramatized by them later and unsuccessfully produced at the Court theatre in 1874. In rapid succession followed *My Little Girl* (1873); *With Harp and Crown* (1874); *This Son of Vulcan* (1876); *The Golden Butterfly* (1876); *The Monks of Thelema* (1878) and others. (See BESANT, SIR WALTER.) James Rice died at Redhill on April 26, 1882.

RICE, a well-known cereal, is the staple food of hundreds of millions of people in Asia. According to R. J. Roschewitz, cultivated rice, *Oryza sativa*, including all its numerous varieties, originated from wild species which are indigenous to Africa, India and Indo-China. The cultivated rice plant is an annual grass with linear pubescent or glabrous leaves, each provided with a pointed ligule. The spikelets are borne on a loose panicle, which is erect at blooming, but nodding as the grains develop and mature. Each spikelet contains one flower enclosed by the compressed lemma and palea. At the base of each of these organs is a small lance-shaped glume. The flower consists of six stamens and an ovary surmounted by two styles bearing a feathery stigma. The ovary, after fertilization, develops into the fruit or grain, which is enclosed by the lemma and palea or hull. The cultivated varieties are numerous and differ markedly in morphological characters and in physiological behaviour. Most varieties are adapted for growth on submerged land, but others, known as upland rice, are grown on land not submerged.

Rice is grown in coastal plains, tidal deltas and river basins in tropical, semi-tropical and temperate regions where fresh water is available to submerge the land. In the orient, where most of the farms are too small for the use of farm machinery, rice is generally grown by hand labour, although animals, when available, are used in preparing the land. The rice is sown broadcast on well prepared beds, and when the seedlings are 25 to 30 days old they are pulled and transplanted to the field or paddy by hand. Before transplanting, the fields, which are inclosed by levees or bunds, are submerged 2 to 4 in. and the surface soil is thoroughly stirred. Two to five seedlings are placed in hills 3 to 6 in. apart in rows 8 to 12 in. apart. The land is submerged dur-

ing most of the growing season, and the crop is harvested by hand.

Outside of the orient, farm machinery usually is used for preparing the land, seeding and harvesting. In California, most of the rice is broadcast on the water from aeroplanes. The crop is grown in essentially the same manner as wheat, oats and barley, except that the land is submerged during most of the growing season. About 95% of the world's rice is produced in Asia and the nearby islands. The principal rice-producing countries, outside of the orient, are Egypt, Italy, Spain, Brazil and the United States.

Preparation of Rice.—The kernel of rice as it leaves the threshing is enclosed by the hull or husk, and is known as paddy or rough rice. Rough rice is used for seed and feed for livestock, but most of it is milled for human consumption. Rice is a good energy food, and is consumed in vast quantities in the orient. In the western hemisphere, however, rice is not the staple cereal food, except in certain Caribbean and South Pacific islands. A diet limited largely to well milled rice renders eastern people on a restricted diet liable to beri-beri, a deficiency disease caused by a shortage of essential thiamin (vitamin B₁) and minerals. This disease, however, can be avoided by adding legumes, fish, fruits and vegetables to the diet. Rough rice that is parboiled and dried prior to milling retains more thiamin and minerals than untreated rice, and hence is less apt to cause beri-beri. It appears that in parboiling, the thiamin, which is largely in the germ and bran layers of the kernel, diffuses into and is fixed in the starchy endosperm.

Most of the rice is milled in or near the areas in which it is produced. In modern mills, special machines are used for removing the hull from the kernel, for removing the bran layers by attrition, for polishing, for coating and for grading. The object in milling is to remove the hull and the bran layers of the kernel with as little breakage as possible, for the most valuable product is the whole kernel.

Milled rice often is coated with glucose and talc, or with vegetable oils, to improve its appearance. The by-products, bran and polish, are used as feed for livestock, the broken rice for brewing, distilling, and the manufacturing of starch and rice flour.

The hulls are used for fuel or packing, and the straw is used for feed, for bedding livestock, for thatching roofs, and for mats, garments, packing and broom straws.

United States.—The 1951 U.S. rice crop of 43,805,000 bags (100 lb. each) was 7% larger than the previous record crop (1949), 13% larger than the 38,689,000 bags of 1950 and about one-third larger than the 1940-49 average (31,431,000 bags). The large crop of 1951 resulted from a 20% increase in harvested

RICE (*ORYZA SATIVA*), SHOWING GENERAL HABIT OF GROWTH

A. Single flower with part removed to show branched stigma and 6 stamens
B. Single stamen (Both A and B are enlarged)

but exceeded the 2,083-lb. average of 1940-49.

In 1951 Texas ranked first among the states with 12,408,000 bags, followed by Louisiana with 11,324,000, California with 10,362,000 and Arkansas with 9,011,000 bags.

World Production.—The world rice crop for 1951-52 was estimated at 337,387,500,000 lb., compared with 339,644,300,000 lb. in 1950-51 and about 335,700,000,000 lb. before World War II. Planted acreage was near the previous year (233,220,000 ac.) and well above the 211,547,000 ac. of the prewar period.

World exports of rice in 1951 were at a level about half as large as the pre-World War II level, which was about 20,000,000,000 lb. of milled rice per year.

RICE BIRD: see BOBOLINK.

RICE PAPER. The substance which has received this name in Europe, through the mistaken notion that it is made from rice, consists of the pith of a small tree, *Aralia papyrifera*, which grows in the swampy forests of Formosa. The cylindrical core of pith is rolled on a hard flat surface against a knife, by which it is cut in thin sheets of a fine ivory-like texture. Dyed in various colours, rice paper is extensively used for the preparation of artificial flowers, while the white sheets are employed by native artists for water-colour drawings.

RICH, BARNABE (c. 1540-1617), English author and soldier, was a distant relative of Lord Chancellor Rich. He fought in the Low Countries, rising to the rank of captain, and afterward served in Ireland. He shared in the colonization of Ulster, and spent the latter part of his life near Dublin. In the intervals of his campaigns he produced many pamphlets on political questions and romances.

He died on Nov. 10, 1617. His best-known work is *Rich's Farewell to Military Profession containing verie Pleasant discourses fit for a peaceable time* (1581). Of the eight stories contained in it, five, he says, "are forged only for delight, neither credible to be believed, nor hurtful to be perused." The rest are translations from the Italian. Among his euphuistic tales are *The Strange and Wonderful Adventures of Don Simonides* (1581), with its sequel (1584); and *The Adventures of Brissanus, prince of Hungaria* (1592).

His authenticated works number 24. His works on Ireland include *Alarum to England* (1578); *A New Description of Ireland* (1610); and *The Irish Hubbub, or the English Hue and Cry* (1617), in which he also inveighs against the use of tobacco.

See "Introduction" to the Shakespeare Society's reprint of *Rich's Farewell* (1846); P. Cunningham's "Introduction" to *Rich's Honesty of this Age* (reprinted for the Percy Society, 1844); and the life by S. Lee in the *Dict. Nat. Biog.*

RICH, JOHN (1692-1761), English actor, the "father of English pantomime," was the son of Christopher Rich (d. 1714), the manager of Drury Lane, with whose quarrels and tyrannies Colley Cibber's *Apology* is much occupied. John Rich opened the new theatre in Lincoln's Inn Fields left unfinished by his father, and here, in 1716, under the stage name of Lun, he first appeared as Harlequin in a piece which developed into an annual pantomime. Rich was less happy in his management of Covent Garden, which he opened in 1733, until Garrick's arrival (1746), when a most prosperous season ensued, followed by a bad one when Garrick went to Drury Lane. During Rich's management occurred the rival performances of *Romeo and Juliet*—Barry and Mrs. Cibber at Covent Garden, and Garrick and Miss Belamy at Drury Lane—and the competition between the two rival actors in *King Lear*. Rich died on Nov. 25, 1761. Garrick has described his acting in pantomime:

When Lun appeared, with matchless art and whim,
He gave the power of speech to every limb:
Tho' masked and mute, conveyed his quick intent,
And told in frolic gesture what he meant.

Rice Production of the Principal Producing Countries
(In millions of pounds; rough)

Country	1951-52	1950-51	Average, 1951-56 1939-40
China	99,000	103,500	110,375
India	27,740	26,000	26,740
Pakistan	25,000	27,850	26,450
Japan	24,500	25,443	26,701
Thailand	24,500	24,912	24,180
Malayan federation	23,300	23,000	24,300
Indonesia	22,800	22,500	23,650

acreage, 1,947,000 ac., compared with 1,620,000 ac. in 1950. An average yield of 2,250 lb. per acre fell below the 2,388 lb. of 1950

RICH, PENELOPE, *LADY* (c. 1562–1607), the Stella of Sir Philip Sidney's *Astrophel and Stella*, was the daughter of Walter Devereux, 1st Earl of Essex. She was a child of fourteen when Sir Philip Sidney accompanied the queen on a visit to Lady Essex in 1576, on her way from Kenilworth, and must have been frequently thrown into the society of Sidney, in consequence of the many ties between the two families. Essex died at Dublin in Sept. 1576. He had sent a message to Philip Sidney from his death-bed expressing his desire that he should marry his daughter, and later his secretary wrote to the young man's father, Sir Henry Sidney, in words which seem to point to the existence of a definite understanding. But her relative and guardian, Henry Hastings, earl of Huntingdon, secured Burgley's assent in March 1581 for her marriage with Robert Rich, 3rd Baron Rich. Penelope is said to have protested in vain against the alliance with Rich, who is represented as a rough and overbearing husband. The evidence against him is, however, chiefly derived from sources as interested as Sir Philip Sidney's violent denunciation in the twenty-fourth sonnet of *Astrophel and Stella*, "Rich fooles there be whose base and filthy hart." Sidney's serious love for Penelope appears to date from her marriage with Rich. The eighth song of *Astrophel and Stella* narrates her refusal to accept him as a lover.

Lady Rich was the mother of six children by her husband when she contracted in 1595 an open liaison with Charles Blount, 8th Lord Mountjoy, to whom she had long been attached. Rich obtained a legal separation in 1601, and Mountjoy acknowledged her five children born after 1595. Mountjoy was created earl of Devonshire on the accession of James I., and Lady Rich was in high favour at court. In 1605 they legitimized their connection by a marriage celebrated by William Laud, the earl's chaplain. This proceeding, carried out in defiance of canon law, was followed by their banishment from court. Devonshire died on April 3, 1606, and his wife within a year of that date.

See the editions of *Astrophel and Stella* by Dr. A. B. Grosart, E. Arber and A. W. Pollard; also the various lives of Sir Philip Sidney, and Mrs. Aubrey Richardson's *Famous Ladies of the English Court* (London, 1899). See also references under SIDNEY.

RICH, RICHARD, 1st BARON RICH (c. 1490–1567), English lord chancellor, was born about 1490, in St. Laurence Jewry, London. After holding various preferments, he was knighted in 1533, and became solicitor-general, acting under Thomas Cromwell in the demolition of the monasteries. He played a malicious part in the trials of Sir Thomas More and Bishop Fisher. Rich became first chancellor (1536) of the court of Augmentations, and benefited vastly by its disposal of the monastic revenues. In the same year, he was speaker in the House of Commons. He was a Roman Catholic by conviction, and was a willing agent in the Catholic reaction after the fall of Thomas Cromwell.

Rich was one of the executors of Henry VIII's will. In 1548 he became Baron Rich of Leeze. As chancellor in succession to Wriothesley he supported Protector Somerset until Oct. 1549, when he deserted to Warwick, and presided over the trial of his former chief. At the close of 1551 he retired from the chancellorship on the ground of ill-health at the time of the final breach between Warwick (now Northumberland) and Somerset.

Lord Rich was an active persecutor during the restoration of the old religion in Essex under Mary's reign. He died at Rochford, Essex, on June 12, 1567, and was buried in Felsted church.

The chief authorities are the official records of the period covered by his official life, calendared in the Rolls Series. See also A. F. Pollard, *England under Protector Somerset* (1900); P. Morant, *History of Essex* (2 vols, 1768); R. W. Dixon, *History of the Church of England* (6 vols, 1878–1902); and lives in J. Sargeant's *History of Felsted School* (1880); Lord Campbell's *Lives of the Lord Chancellors* (1845–69); and C. H. and T. Cooper's *Athenae Cantabrigienses* (2 vols, 1858–61).

RICH, RICHARD (fl. 1610), English soldier and adventurer, the author of *News from Virginia*, sailed from England on June 2, 1609, for Virginia, with Captain Christopher Newport and the three commissioners entrusted with the foundation of the new colony. In his verse pamphlet he relates the adventures undergone by the expedition, and describes the resources of the

new country, with the advantages offered to colonists. The only known copy of this tract, dated 1610, is in the Huth Library. A reprint edited by J. O. Halliwell-Phillips appeared in 1865.

RICHARD, ST., of Wyche (c. 1197–1253), English saint and bishop, was named after his birthplace, Droitwich in Worcestershire. Educated at Oxford, he soon began to teach in the university, of which he became chancellor, probably after he had studied in Paris and in Bologna. About 1235 he became chancellor of the diocese of Canterbury under Archbishop Edmund Rich, and he was with the archbishop during his exile in France. Having returned to England some time after Edmund's death in 1240 he became vicar of Deal and chancellor of Canterbury for the second time. In 1244 he was elected bishop of Chichester, being consecrated at Lyons by Pope Innocent IV. In March 1245, although Henry III. refused to give him the temporalities of the see, the king favouring the candidature of Robert Passelew (d. 1252). In 1246, however, Richard obtained the temporalities. He died at Dover in April 1253. It was generally believed that miracles were wrought at his tomb in Chichester cathedral, which was long a popular place of pilgrimage, and in 1262 he was canonized at Viterbo by Pope Urban IV.

His life by his confessor, Ralph Bocking, is published in the *Acta Sanctorum* of the Bollandists, with a later life by John Capgrave.

RICHARD (d. 1184), archbishop of Canterbury, was a Norman, who became a monk at Canterbury, where he acted as chaplain to Archbishop Theobald and was a colleague of Thomas Becket. In 1173, more than two years after the murder of Becket, it was decided to fill the vacant archbishopric of Canterbury; there were two candidates, Richard, at that time prior of St. Martin's, Dover, and Odo, prior of Canterbury, and in June Richard was chosen, although Odo was the nominee of the monks. Objections were raised against this election both in England and in Rome, but in April 1174 the new archbishop was consecrated at Anagni by Pope Alexander III., and he returned to England towards the close of the year. The ten years during which Richard was archbishop were disturbed by disputes over the respective rights of the sees of Canterbury and York. Richard died at Rochester on Feb. 16, 1184, and was buried in his cathedral.

See the article by W. Hunt in the *Dict. Nat. Biog.* vol. xlviii. (1896); and W. F. Hook, *Lives of the Archbishops of Canterbury*.

RICHARD I. (1157–1199), king of England, nicknamed "Coeur de Lion" and "Yea and Nay," was the third son of Henry II. by Eleanor of Aquitaine. Born in Sept. 1157, he received at the age of 11 the duchy of Aquitaine, and was formally installed in 1172. In his new position he was allowed, probably from regard to Aquitanian susceptibilities, to govern with an independence which was studiously denied to his brothers in their shares of the Angevin inheritance. Yet in 1173 Richard joined with the young Henry and Geoffrey of Brittany in their rebellion; Aquitaine was twice invaded by the old king before the unruly youth would make submission. Richard was soon pardoned and reinstated in his duchy, where he distinguished himself by crushing a formidable revolt (1175) and exacting homage from the count of Toulouse. In a short time he was so powerful that his elder brother Henry became alarmed and demanded, as heir-apparent, that Richard should do him homage for Aquitaine. Richard having scornfully rejected the demand, a fratricidal war ensued; the young Henry invaded Aquitaine and attracted to his standard many of Richard's vassals, who were exasperated by the iron rule of the duke. Henry II. marched to Richard's aid; but the war ended abruptly with the death of the elder prince (1183).

Richard, being now the heir to England and Normandy, was invited to renounce Aquitaine in favour of Prince John. The proposal led to a new civil war; and, although a temporary compromise was arranged, Richard soon sought the help of Philip Augustus, to whom he did homage for all the continental possessions in the actual presence of his father (Conference of Bonmoulins, Nov. 28, 1188). In the struggle which ensued the old king was overpowered, chased ignominiously from Le Mans to Angers, and forced to buy peace by conceding all that was demanded of him; in particular the immediate recognition of Richard as his successor.

But the death of Henry II. (1189) at once dissolved the friendship between Richard and Philip. Not only did Richard continue the continental policy of his father, but he also refused to fulfil his contract with Philip's sister, Alais, to whom he had been betrothed at the age of three. An open breach was only delayed by the desire of both kings to fulfil the crusading vows which they had recently taken. Richard, in particular, sacrificed all other interests to this scheme, and raised the necessary funds by the most reckless methods. He put up for auction the highest offices and honours; even remitting to William the Lion of Scotland, for a sum of 15,000 marks, the humiliating obligations which Henry II. had imposed at the Treaty of Falaise. By such expedients he raised and equipped a force which may be estimated at 4,000 men-at-arms and as many foot-soldiers, with a fleet of 100 transports (1191).

Richard did not return to his dominions until 1194. But his stay in Palestine was limited to 16 months. On the outward journey he wintered in Sicily, where he employed himself in quarrelling with Philip and in exacting satisfaction from the usurper Tancred for the dowry of his widowed sister, Queen Joanna, and for his own share in the inheritance of William the Good. Leaving Messina in March 1197, he interrupted his voyage to conquer Cyprus, and only joined the Christian besiegers of Acre in June. The reduction of that stronghold was largely due to his energy and skill. But his arrogance gave much offence. After the fall of Acre he inflicted a gross insult upon Leopold of Austria; and his relations with Philip were so strained that the latter seized the first pretext for returning to France, and entered into negotiations with Prince John (*see* JOHN, king of England) for the partition of Richard's realm.

Richard also threw himself into the disputes respecting the crown of Jerusalem, and supported Guy of Lusignan against Conrad of Montferrat with so much heat that he incurred grave, though unfounded, suspicions of complicity when Conrad was assassinated by emissaries of the Old Man of the Mountain. None the less Richard, whom even the French crusaders accepted as their leader, upheld the failing cause of the Frankish Christians with valour and tenacity. He won a brilliant victory over the forces of Saladin at Arsuf (1191), and twice led the Christian host within a few miles of Jerusalem. But the dissensions of the native Franks and the crusaders made it hopeless to continue the struggle; and Richard was alarmed by the news which reached him of John's intrigues in England and Normandy. Hastily patching up a truce with Saladin, under which the Christians kept the coast-towns and received free access to the Holy Sepulchre, Richard started on his return (Oct. 9, 1192).

His voyage was delayed by storms, and he appears to have been perplexed as to the safest route. The natural route overlaid through Marseilles and Toulouse was held by his enemies; that through the empire from the head of the Adriatic was little safer, since Leopold of Austria was on the watch for him. Having adopted the second of these alternatives, he was captured at Vienna in a mean disguise (Dec. 20, 1192) and strictly confined in the duke's castle of Dürrenstein on the Danube. His mishap was soon known to England, but the regents were for some weeks uncertain of his whereabouts. This is the foundation for the tale of his discovery by the faithful minstrel Blondel, which first occurs in a French romantic chronicle of the next century. Early in 1193 Leopold surrendered his prize, under compulsion, to the emperor Henry VI., who was aggrieved both by the support which the Plantagenets had given to the family of Henry the Lion and also by Richard's recognition of Tancred in Sicily. Although the detention of a crusader was contrary to public law, Richard was compelled to purchase his release by the payment of a heavy ransom and by doing homage to the emperor for England. The ransom demanded was 150,000 marks: though it was never discharged in full, the resources of England were taxed to the utmost for the first instalments; and to this occasion we may trace the beginning of secular taxation levied on movable property.

Richard reappeared in England in March 1194; but his stay lasted only a few weeks, and the remainder of his reign was entirely devoted to his continental interests. He left England to be

governed by Hubert Walter (*q.v.*), and his personal authority was seldom asserted except by demands for new subsidies. The rule of the Plantagenets was still popular in Normandy and Aquitaine; but these provinces were unable or unwilling to pay for their own defence. Though Richard proved himself consistently the superior of Philip in the field, the difficulty of raising and paying forces to resist the French increased year by year. Richard could only stand on the defensive; the keynote of his later policy is given by the building of the famous Château Gaillard at Les Andelys (1196) to protect the lower courses of the Seine against invasion from the side of France. He did not live to see the futility of such bulwarks. In 1199 a claim to treasure-trove embroiled him with the viscount of Limoges. He harried the Limousin and laid siege to the castle of Chalus; while directing an assault he was wounded in the shoulder by a crossbow bolt, and, the wound mortifying from unskilful treatment or his own want of care, he died on April 6, 1199. He was buried by his own desire at his father's feet in the church of Fontevault. Here his effigy may still be seen.¹ Though contemporary, it does not altogether agree with the portraits on his Great Seal, which give the impression of greater strength and even of cruelty. The Fontevault bust is no doubt idealized.

The most accomplished and versatile representative of his gifted family, Richard was, in his lifetime and long afterwards, a favourite hero with troubadours and romancers. This was natural, as he belonged to their brotherhood and himself wrote lyrics of no mean quality. But his history shows that he by no means embodied the current ideal of chivalrous excellence. His memory is stained by one act of needless cruelty, the massacre of over two thousand Saracen prisoners at Acre; and his fury, when thwarted or humbled, was ungovernable. A brave soldier, an experienced and astute general, he was never happier than when engaged in war. As a ruler he was equally profuse and rapacious. Not one useful measure can be placed to his credit; and it was by a fortunate accident that he found, in Hubert Walter, an administrator who had the skill to mitigate the consequences of a reckless fiscal policy. Richard's wife was Berengaria, daughter of Sancho VI., king of Navarre, whom he married in Cyprus in May 1191. She was with the king at Acre later in the same year, and during his imprisonment passed her time in Sicily, in Rome and in France. Husband and wife met again in 1195, and the queen long survived the king, residing chiefly at Le Mans. She died soon after 1230. Berengaria founded a Cistercian monastery at Espau.

BIBLIOGRAPHY.—The more important of the general chronicles are: the *Gesta Henrici Secundi*, ascribed to Benedict of Peterborough (*Rolls Series*, 2 vols., 1887); the *Chronica* of Roger of Hoveden (*Rolls Series*, 4 vols., 1868-71); the *Chronica* of Gervase of Canterbury (*Rolls Series*, 1879); the *Imagines Historiarum* of Ralph of Diceto (*Rolls Series*, 2 vols., 1876); the *Historia Regum Anglorum* of William of Newburgh (*in Chronicles of the Reigns of Stephen, etc.*, *Rolls Series*, 2 vols., 1884-85); the *De rebus gestis Ricardi Primi* of Richard of Devizes (*in Chronicles of the Reigns of Stephen, etc.*, vol. iii., *Rolls Series*, 1886); the *Chronicon Anglorum* of Ralph of Coggeshall (*Rolls Series*, 1875); the *Flores Historiarum* of Roger of Wendover (*Rolls Series*, 3 vols., 1886-89); the *Gesta Philippi Augusti* of Rigord (*Société de l'Histoire de France*, Paris, 1882) and of Guillaume le Breton (*op. cit.*). A detailed narrative of Richard's crusade is given in *L'Étoile de la guerre sainte*, a rhyming French chronicle by the minstrel Ambroise (ed. Gaston Paris, Paris, 1897), and in the Latin prose version known as the *Itinerarium O. Peregrinorum et gesta Regis Ricardi*; this last, with some valuable historical letters, is printed in W. Stubbs's *Chronicles and Memorials of the Reign of Richard I.* (*Rolls Series*, 2 vols., 1864-65). Of modern works the following are useful: W. Stubbs's preface to vols. iii. and iv. of Hoveden; the same author's *Constitutional History of England*, vol. I. (Oxford, 1827); Miss K. Norgate's *England under the Angevin Kings*, vol. ii. (1887); and *Richard the Lion Heart* (1924); Sir J. H. Ramsay's *Angevin Empire* (1903); R. Köhricht's *Geschichte des Königreichs Jerusalem* (1898); W. B. Stevenson's *Crusaders in the East* (Cambridge, 1907); A. Cartellieri's *Philipp II. August* (Leipzig, 1899, etc.). (H. W. L. D.)

RICHARD II. (1367-1400), king of England, younger son of Edward the Black Prince by Joan "the Fair Maid of Kent," was born at Bordeaux on Jan. 6, 1367. He was brought to Eng-

¹The remains of Richard, together with those of Henry II. and his queen Eleanor, were removed in the 17th century from their tombs to another part of the church. They were rediscovered in 1910 during the restoration of the abbey undertaken by the French Government.

land in 1371, and after his father's death was, on the petition of the Commons in parliament, created prince of Wales on Nov. 20, 1376. When Edward III. died, on June 21, 1377, Richard became king. Popular opinion had credited John of Gaunt with designs on the throne. This was not justified; nevertheless, the rivalry of the boy-king's uncles added another to the troubles due to the war, the Black Death and the prospect of a long minority. At first the government was conducted by a council appointed by parliament. The council was honest, but the difficulties of the situation were too great. The ill-considered poll-tax of 1381 was the occasion, though not the real cause, of the Peasants' Revolt in that year. The ministers were quite unequal to the crisis, and when Wat Tyler and his followers got possession of London, Richard showed a precocious tact and confidence in handling it. He met and temporized with the rebels on June 13 at Mile End, and again next day at Smithfield; and with courageous presence of mind, he saved the situation when Tyler was killed, by calling on them to take him for their leader.

From this time Richard began to assert himself. His chief ministers, appointed by parliament in 1382, were the earl of Arundel and Michael de la Pole. Arundel Richard disliked, and dismissed next year, when he began his personal government. Pole, whom he retained as chancellor and made earl of Suffolk, was a well-chosen adviser. But others, and especially his youthful favourite Robert de Vere, promoted to be marquess of Dublin and duke of Ireland, were less worthy. Further, Richard made his own position difficult by lavish extravagance and by outbursts of temper. He chafed under the restraint of his relatives, and therefore encouraged John of Gaunt in his Spanish enterprise.

Thereupon, Thomas of Gloucester, supported by Arundel, attacked his nephew's ministers in the parliament of 1386, and by open hints at deposition forced Richard to submit to a council of control. When Richard, with the aid of his friends and by the advice of subservient judges, planned a reversal of the parliament, Gloucester, at the head of the so-called lords appellant, anticipated him. Richard had been premature and ill-advised. Gloucester had the advantage of posing as the head of the constitutional party. The king's friends were driven into exile or executed, and he himself forced to submit to the loss of all real power (May 1388). Richard changed his methods, and when the lords appellant had lost credit, asserted himself constitutionally by dismissing Gloucester's supporters from office, and appointing in their place well-approved men like William of Wykeham. In the next parliament of 1390 the king showed himself ready to meet and conciliate his subjects. The simultaneous return of John of Gaunt from Spain put a check on Gloucester's ambition. For seven years Richard ruled constitutionally and on the whole well.

In Jan. 1383 Richard had married Anne of Bohemia (1366-1394), daughter of the emperor Charles IV. Her death on June 7, 1394 was a great shock to Richard, and incidentally had important consequences. Richard sought distraction by an expedition to Ireland, the first visit of an English king for more than two centuries. In his policy there he showed a wise statesmanship. At the same time he was negotiating for a permanent peace with France, which was finally arranged in Oct. 1396 to include his own marriage with Isabella, daughter of Charles VI., a child of seven. Gloucester criticized the peace openly, and there was some show of opposition in the parliament of Feb. 1397.

Period of Absolute Monarchy.—But there was nothing to foreshadow the sudden stroke by which in July Richard arrested Gloucester and his chief supporters, the earls of Arundel and Warwick. The others of the five lords appellant, Henry of Bolingbroke, afterwards King Henry IV., and the earl of Nottingham, now supported the king. Richard's action was apparently in deliberate revenge for the events of 1387-88. Gloucester, after a forced confession, died in prison at Calais, smothered by his nephew's orders. Arundel, in a packed parliament, was condemned and executed; his brother Thomas archbishop of Canterbury was exiled. The king's friends, including Nottingham and Bolingbroke, made dukes of Norfolk and Hereford, were all promoted in title and estate. Richard himself was rewarded for ten years' patience by the possession of absolute power. He might perhaps have

established it if he could have exercised it with moderation. But he declared that the laws of England were in his mouth, and supported his court in wanton luxury by arbitrary methods of taxation. By the exile of Norfolk and Hereford in Sept. 1398 he seemed to have removed the last persons he need fear. He was so confident that in May 1399 he paid a second visit to Ireland, taking with him all his most trusted adherents.

Rebellion and Deposition.—Thus when Henry landed at Ravenspur in July he found only half-hearted opposition, and when Richard himself returned it was too late. Ultimately Richard surrendered to Henry at Flint on Aug. 19, promising to abdicate if his life was spared. He was taken to London riding behind his rival with indignity. On Sept. 30, he signed in the Tower a deed of abdication, wherein he owned himself insufficient and useless, reading it first aloud with a cheerful mien and ending with a request that his cousin would be good lord to him. The parliament ordered that Richard should be kept close prisoner, and he was sent secretly to Pontefract. There in Feb. 1400 he died: no doubt of the rigour of his winter imprisonment, rather than by actual murder as alleged in the story adopted by Shakespeare. The mystery of Richard's death led to rumours that he had escaped, and an impostor pretending to be Richard lived during many years under the protection of the Scottish government. But no doubt it was the real Richard who was buried without state in 1400 at King's Langley, and honourably reinterred by Henry V. at Westminster in 1413.

Richard II. is a character of strange contradictions. It is difficult to reconcile the precocious boy of 1381 with the wayward and passionate youth of the next few years. Even if it be supposed that he dissembled his real opinions during the period of his constitutional rule, it is impossible to believe that the apparent indifference which he showed in his fall was the mere acting of a part. His violent outbursts of passion perhaps give the best clue to a mercurial and impulsive nature, easily elated and depressed. He had real ability, and in his Irish policy, and in the preference which he gave to it over continental adventure, showed a statesmanship in advance of his time. But this, in spite of his lofty theory of kingship, makes it all the more difficult to explain his extravagant bearing in his prosperity. In appearance Richard was tall and handsome, if effeminate. He had some literary tastes, which were shown in fitful patronage of Chaucer, Gower and Froissart. Richard's second queen, Isabella (1389-1409), was born in Paris on Nov. 9, 1389, and was married to the English king at Calais in October, or November, 1396, but on account of the bride's youth the marriage was never consummated.

When Richard lost his crown in 1399 Isabella was captured by Henry IV.'s partisans and sent to Sonning, near Reading, while her father, Charles VI., asked in vain for the restoration of his daughter and of her dowry. In 1401 she was allowed to return to France; in 1406 she became the wife of the poet, Charles, duke of Orleans, and she died on Sept. 13, 1409.

BIBLIOGRAPHY.—The best contemporary authorities are the *Chronicon Anglie* down to 1388, Walsingham's *Historia Anglicana*, the *Annales Ricardi II.*, Knighton's *Chronicle* (all these in the Rolls Series), the *Vita Ricardi II.* by a Monk of Evesham (ed. T. Hearne), and the *Chronique de la traison et mort* (English Hist. Soc.), Froissart wrote from some personal knowledge. A metrical account of Richard's fall, probably written by a French knight called Creton, is printed in *Archæologia*, xx. The chief collections of documents are the *Rolls of Parliament* and the *Calendar of Patent Rolls*. H. A. Wallon's *Ricard II.* (Paris, 1864) is the fullest life, though now somewhat out of date. For other modern accounts see W. Stubbs, *Constitutional History*, and C. W. C. Oman, *The Political History of England*, vol. iv., and *The Great Revolt of 1381*. (C. L. E.)

RICHARD III. (1452-1485), king of England, youngest son of Richard, duke of York, by Cicely Neville, was born at Fotheringhay on Oct. 2, 1452. After the second battle of St. Albans in Feb. 1461, his mother sent him with his brother George for safety to Utrecht. They returned in April, and at the coronation of Edward IV. Richard was created duke of Gloucester. As a mere child he had no importance till 1469-70, when he supported his brother against Warwick, shared his exile and took part in his triumphant return. He distinguished himself at Barnet and Tewkesbury; according to the Lancastrian story, after the latter battle

he murdered the young Edward of Wales in cold blood; this is discredited by the authority of Warkworth (*Chronicle*, p. 18); but Richard may have had a share in Edward's death during the fighting. He cannot be so fully cleared of complicity in the murder of Henry VI., which probably took place at the Tower on the night of May 23, when Richard was certainly present there.

Richard shared to the full in his brother's prosperity. He had large grants of lands and office, and by marrying Anne (1456-1485), the younger daughter of Warwick, secured a share in the Neville inheritance. This was distasteful to George, duke of Clarence, who was already married to the elder sister, Isabel. The rivalry of the two brothers caused a quarrel which was never appeased. Richard does not, however, seem to have been directly responsible for the death of Clarence in 1478; Sir Thomas More, who is a hostile witness, says that he resisted it openly "howbeit somewhat (as men deemed) more faintly than he that were heartily minded to his wealth." Richard's share of the Neville inheritance was chiefly in the north, and he resided usually at Middleham in Yorkshire. In May 1480 he was made the king's lieutenant-general in the north, and in 1482 commanded a successful invasion of Scotland. His administration was good, and brought him well-deserved popularity.

Protectorate.—On Edward's death he was kept informed of events in London by William, Lord Hastings, who shared his dislike of the Woodville influence. On April 29, 1483, supported by the duke of Buckingham, he intercepted his nephew at Stony Stratford and arrested Lord Rivers and Richard Grey, the little king's half-brother. It was in Richard's charge that Edward was brought to London on May 4. Richard was recognized as protector, the Woodville faction was overthrown, and the queen with her younger children took sanctuary at Westminster. For the time the government was carried on in Edward's name, and June 22 was appointed for his coronation. Richard was nevertheless gathering forces and concerting with his friends. In the council there was a party, of whom Hastings and Bishop Morton were the chief, which was loyal to the boy-king. On June 13 came the famous scene when Richard appeared suddenly in the council baring his withered arm and accusing Jane Shore and the queen of sorcery; Hastings, Morton and Stanley were arrested and the first-named at once beheaded. A few days later, probably on June 25, Rivers and Grey were executed at Pontefract. On June 22 Dr. Shaw was put up to preach at Paul's Cross against the legitimacy of the children of Edward IV. On the 25th a sort of parliament was convened at which Edward's marriage was declared invalid on the ground of his precontract with Eleanor Talbot, and Richard rightful king. Richard, who was not present, accepted the crown with feigned reluctance, and from the following day began his formal reign.

Usurpation of the Throne.—On July 6, Richard was crowned at Westminster, and immediately afterwards made a royal progress through the Midlands, on which he was well received. But in spite of its apparent success the usurpation was not popular. Richard's position could not be secure whilst his nephews lived. There seems to be no reasonable doubt that early in August Edward V. and his brother Richard (whom Elizabeth Woodville had been forced to surrender) were murdered by their uncle's orders in the Tower. Attempts have been made to clear Richard's memory. But the report of the princes' death was believed in England at the time, "for which cause king Richard lost the hearts of the people" (*Chronicles of London*, 191), and it was referred to as a definite fact before the French states-general in January 1484. The general, if vague, dissatisfaction found its expression in Buckingham's rebellion.

Richard, however, was fortunate, and the movement collapsed. He met his only parliament in Jan. 1484 with some show of triumph, and deserves credit for the wise intent of its legislation. He could not, however, stay the undercurrent of disaffection, and his ministers, Lovell and Catesby, were unpopular. His position was weakened by the death of his only legitimate son in April 1484. His queen died also a year later (March 16, 1485), and public opinion was scandalized by the rumour that Richard intended to marry his own niece, Elizabeth of York. Thus the

feeling in favour of his rival Henry Tudor strengthened. Henry landed at Milford Haven on Aug. 7, 1485, and it was with dark forebodings that Richard met him at Bosworth on the 22nd. The defection of the Stanleys decided the day. Richard was killed fighting, courageous at all events. After the battle his body was carried to Leicester, trussed across a horse's back, and buried without honour in the church of the Greyfriars.

Richard was not the villain that his enemies depicted. He had good qualities, both as a man and a ruler, and showed a sound judgment of political needs. Still it is impossible to acquit him of the crime, the popular belief in which was the chief cause of his ruin. He was a typical man in an age of strange contradictions of character, of culture combined with cruelty, and of an emotional temper that was capable of high ends, though unscrupulous of means. Tradition represents Richard as deformed. It seems clear that he had some physical defect, though not so great as has been alleged. Extant portraits show an intellectual face characteristic of the early Renaissance, but do not indicate any deformity.

BIBLIOGRAPHY.—The chief original authorities are Sir Thomas More's *History of Richard III.*, based on information supplied by Archbishop Morton, and therefore to be accepted with caution; the more trustworthy *Continuation of the Croyland Chronicle* in Fulman's *Scriptores*, the *History of Polydore Vergil*, written in a Tudor spirit; the *Chronicle of London* (ed. C. L. Kingsford, 1905), and its based expansion in *Fabyan's Chronicle*. See also *Letters and Papers Illustrative of the Reigns of Richard III. and Henry VII.*, ed. J. Gardner, in *Rolls Series*. Of later accounts those in *Stow's Annals* (preserving some oral tradition) and George Buck's *Richard III.* (p. Kennet *History of England* deserve mention. Horace Walpole attempted a vindication in his *Historic Doubts* (1768). The best modern account is James Gairdner's *Life of Richard III.* (2nd ed. 1898). The latest and fullest edition is given in Sir Clements Markham's *Richard III., His Life and Character* (1906); G. B. Churchill's *Richard the Third up to Shakespeare* (Palastar x, 1902) is a valuable digest of material. (C. L. K.)

RICHARD, earl of Cornwall and king of the Romans (1209-1272), was the second son of the English king John by Isabella of Angoulême. Born in 1209, Richard was the junior of his brother, Henry III., by fifteen months; he was educated in England and received the earldom of Cornwall in 1225. From this date to his death he was a prominent figure on the political stage. In the years 1225-27 he acted as governor of Gascony; between 1227 and 1238, owing to quarrels with his brother and dislike of the foreign favourites, he attached himself to the baronial opposition and bade fair to become a popular hero. But in 1240 he took the command of a crusade in order to escape from the troubled atmosphere of English politics. He was formally reconciled with Henry before his departure; and their amity was cemented on his return by his marriage with Sancha of Provence, the sister of Henry's queen (1243). In 1257 a bare majority of the German electors nominated Richard as king of the Romans, and he accepted their offer at Henry's desire.

In the years 1257-68 Richard paid four visits to Germany. He obtained recognition in the Rhineland, which was closely connected with England by trade relations. Otherwise, however, he was unsuccessful in securing German support. In the English troubles of the same period he endeavoured to act as a mediator. On the outbreak of civil war in 1254 he took his brother's side, and his capture in a windmill outside Lewes, after the defeat of the royalist army, is commemorated in the earliest of English vernacular satires; he remained a prisoner till the fall of Montfort. But after Evesham he exerted himself, not without success, to obtain reasonable terms for those who had suffered from the vengeance of the royalist party. He died on April 3, 1272. His end is said to have been hastened by grief for his eldest son, Henry of Almain, who had been murdered in the previous year by the sons of Simon de Montfort at Viterbo.

Authorities.—The original sources and general works of reference are the same as for the reign of Henry III. G. C. Gebauer's *Leben und Thaten Herrn Richards von Cornwall* (Leipzig, 1744), H. Koch's *Richard von Cornwall, 1209-1257* (Strassburg, 1888), and A. Bussan's *Doppelwahl des Jahres, 1257* (Münster, 1866) are useful monographs. (H. W. C. D.)

RICHARD OF CIRENCESTER (c. 1335-c. 1401), his torical writer, was a member of the Benedictine abbey at West-

minster, and his name ("Circestr") first appears on the chamberlain's list of the monks of that foundation drawn up in the year 1355. In the year 1391 he obtained a licence from the abbot to go to Rome, and in this the abbot gives his testimony to Richard's perfect and sincere observance of religion for some 30 years. In 1400 Richard was in the infirmary of the abbey, where he died in the following year. His only known extant work is *Speculum Historiale de Gestis Regum Angliæ*, 447-1066. The ms. of this is in the university library at Cambridge, and has been edited for the Rolls Series (No. 30) by Professor J. E. B. Mayor (2 vols., 1865-69).

RICHARD OF DEVIZES (fl. 1195), English chronicler, was a monk of St. Swithun's house at Winchester. The *Chronicon de rebus gestis Ricardi Primi*, by which Richard of Devizes is chiefly known, is an account of events in England and the Holy Land during the third crusade.

See the editions of the *Chronicon de rebus gestis Ricardi Primi* by J. Stevenson (Eng. His. Soc., 1838) and by R. Howlett in *Chronicles of the Reigns of Stephen, Henry II. and Richard I.*, vol. iii. (Rolls Series, 1886); the *Annales de Wintonie* in H. R. Luard's *Annales Monastici*, vol. ii. (Rolls Series, 1864-69).

RICHARD OF HEXHAM (fl. 1141), English chronicler, became prior of Hexham about 1141, and died between 1165 and 1178. He wrote *Brevis Annaliotia*, a short history of the church of Hexham from 674 to 1138, for which he borrowed from Bede, Eddius and Simeon of Durham. This is published by J. Raine in *The Priory of Hexham, its Chronicles, Endowments and Annals* (Durham, 1864-65). More important is his *Historia de gestis regis Stephani et de bello Standardi*, valuable for the history of the north of England during the earlier part of the reign of Stephen, and for the battle of the Standard. It has been edited for the Rolls Series by R. Howlett in the *Chronicles of the Reigns of Stephen, Henry II. and Richard I.*, vol. iii. (1886); and has been translated by J. Stevenson in the *Church Historians of England*, vol. iv. (1856).

RICHARD OF ILCHESTER or OF TOCLYVE (d. 1188), English statesman and prelate, was born in the diocese of Bath, where he obtained preferment. Early in the reign of Henry II., however, he is found acting as a clerk in the king's court, probably under Thomas Becket, and he was one of the officials who assisted Henry in carrying out his great judicial and financial reforms. In 1162, or 1163, he was appointed archdeacon of Poitiers, but he passed most of his time in England, although in the next two or three years he visited Pope Alexander III. and the Emperor Frederick I. in the interests of the English king, who was then engaged in his struggle with Becket. For promising to support Frederick he was excommunicated by Becket in 1166. In May 1173 he was elected bishop of Winchester, being consecrated at Canterbury in October 1174. In 1176 he was appointed justiciar and seneschal of Normandy, and was given full control of all the royal business in the duchy. He died on Dec. 21 or 22, 1188, and was buried in Winchester cathedral.

See the article by Miss K. Norgate in the *Dick, Nat. Biog.*, vol. xlviii. (1896); and W. R. W. Stephens and W. W. Capes, *The Bishops of Winchester* (1907).

RICHARD OF ST. VICTOR (d. 1173), theologian and mystic of the 12th century. Very little is known of his life; he was born in Scotland or in England, and went to Paris, where he entered the abbey of St. Victor and was a pupil of the great mystic, Hugh of St. Victor. He succeeded as prior of this house in 1162. The best known of Richard's writings are the mystical treatises: *De statu hominis interioris*, *De preparatione animi ad contemplationem*, *De gratia contemplationis*, *De gradibus caritatis*, *De arca nuptialis*, and his two works on the Trinity: *De trinitate libri sex*, *De tribus appropriatis personis in Trinitate*. According to him, six steps lead the soul to contemplation: (1) contemplation of visible and tangible objects; (2) study of the productions of nature and of art; (3) study of character; (4) study of souls and of spirits; (5) entrance to the mystical region which ends in (6) ecstasy.

His theory of the Trinity is chiefly based on the arguments of Anselm of Canterbury. The influence of neo-Platonic terminology, as well as of the works of the pseudo-Dionysius, can be clearly

detected in his works. In the *Paradiso* Dante has placed Richard among the greatest teachers of the Church. His writings came into favour again in the 16th and 17th centuries, six editions of his works having been printed between 1506 and 1650.

RICHARDS, THEODORE WILLIAM (1868-1928), U.S. chemist, was born in Germantown, Pa., on Jan. 31, 1868. He graduated from Haverford college (S.B., 1885) and Harvard university (A.B., 1886; Ph.D., 1888); he also studied at Göttingen, Leipzig and the Dresden Technical university.

He was appointed assistant professor of chemistry at Harvard in 1894 and professor in 1901, and was made director of the Wolcott Gibbs memorial laboratory in 1912. He was best known for his researches on atomic weights which he began in 1883. He greatly improved the technique of gravimetric atomic weight determinations, introducing quartz apparatus, the bottling device and the nephelometer. The values of J. S. Stas had been regarded as standard, but about 1903, physicochemical measurements showed that some of his values were not as accurate as had been supposed. Richards and some of his students revised these figures, lowering the value of silver (Stas's standard) from 107.93 to 107.88. Investigations of the atomic weight of lead from different sources definitely proved the existence of isotopes. The results were generally accepted and "for his accurate determination of the atomic weight of a large number of elements" he received the Nobel prize in chemistry in 1914. He also gave much time to physicochemical investigation.

He died at Cambridge, Mass., on April 2, 1928.

RICHARDSON, HENRY HOBSON (1838-1886), American architect, was born in the parish of St. James, La., on Sept. 29, 1838, of a rich family, his mother being a grand-daughter of the famous Dr. Priestley, the English dissenting refugee and man of science. He was graduated from Harvard university in 1859, and went immediately to Paris to study architecture, entering the École des Beaux-Arts. The Civil War, which broke out in the United States while he was in the school, prevented his return to Louisiana, and stripped his family of their possessions. Richardson provided for his own support by working in the offices of practising architects in Paris, till the fall of 1865. He then established himself in New York, where he soon made his way into practice as an architect. In 1878 he moved to Boston, designing there most of the work that made his reputation. He married in 1867 Miss Julia Gorham Hayden of Boston; he died there on April 27, 1886.

Richardson's career was short, and the number of his works was small indeed compared with the attention they attracted and the influence he left behind him. The most important and characteristic are: Trinity church and the so-called Brattle Square church, in Boston; the alterations in the State Capitol at Albany; the county buildings at Pittsburgh; town halls at Albany, Springfield and North Easton; town libraries at Woburn, North Easton, Quincy, Burlington and Malden; Sever hall and Austin hall at Harvard university; the Chamber of Commerce at Cincinnati. Trinity church, the Pittsburgh buildings and the Capitol at Albany were works of great importance, which have had a strong influence on men who followed him.

The best known book about Richardson is Mrs. Schuyler van Rensselaer's *H. H. Richardson and his Works* (Boston, 1888).

RICHARDSON, SIR OWEN WILLANS (1879-), English physicist, was born on April 26, 1879, at Dewsbury, Yorkshire. He was educated at Batley Grammar school and at Trinity college, Cambridge, where he became a fellow. He was professor

of physics at Princeton university, 1906-13, and Wheatstone professor of physics at King's college, London, 1914-24. He was then appointed a Yarrow research professor by the Royal society and director of research in physics at King's college, a post he held until 1944 when he became emeritus professor of physics of the University of London. Richardson's best-known work was on the emission of electricity from hot bodies. He made this subject peculiarly his own and gave it the name "thermionics." Richardson was elected F.R.S. in 1913 and was knighted in 1939. He was awarded the Nobel prize for physics in 1928. He wrote the standard works: *The Electron Theory of Matter* (1914) and *The Emission of Electricity from Hot Bodies* (1916; 2nd ed. 1921).

RICHARDSON, SAMUEL (1689-1761), English novelist, was the son of a London joiner, who, for obscure reasons, probably connected with Monmouth's rebellion, had retired to Derbyshire, where, in 1689, Samuel was born. He was apprenticed at seventeen to an Aldersgate printer named John Wilde. Here he became successively compositor, corrector of the press, and printer on his own account; married his master's daughter according to programme; set up newspapers and books; dabbled a little in literature by compiling indexes and "honest dedications," and ultimately became Printer of the Journals of the House of Commons, Master of the Stationers' Company, and Law-Printer to the King. Like all well-to-do citizens, he had his city house of business and his "country box" in the suburbs; and, after a thoroughly "respectable" life, died on July 4, 1761, being buried in St. Bride's Church, Fleet Street, close to his shop (now demolished), No. 11 Salisbury Court.

The origin of *Pamela* dates back to a request from Rivington of St. Paul's Churchyard and Osborn of Paternoster Row, two book-selling friends who were aware of Richardson's epistolary gifts, to suggest that he should prepare a little model letter-writer for such "country readers" as "were unable to indite for themselves." The result was *Pamela*; or *Virtue Rewarded*. He completed it in a couple of months (Nov. 20, 1739 to Jan. 16, 1740). In Nov. 1740 it was issued by Messrs. Rivington and Osborn, who, a few weeks afterward (Jan. 1741), also published the model letter-writer under the title of *Letters written to and for Particular Friends, on the most Important Occasions*. Both books were anonymous. The letter-writer was noticed in the *Gentleman's Magazine* for January, which also contains a brief announcement as to *Pamela*, already rapidly making its way without waiting for the reviewers. A second edition, it was stated, was expected; and such was its popularity, that not to have read it was judged "as great a sign of want of curiosity as not to have seen the French and Italian dancers"—i.e., Mme. Chateaufort and the Fausans, who were then delighting the town. In February a second edition duly appeared, followed by a third in March and a fourth in May. At public gardens ladies held up the book to show they had got it; Dr. Benjamin Slocock of Southwark openly commended it from the pulpit; Pope praised it; and at Slough, when the heroine triumphed, the enraptured villagers rang the church bells for joy. The other volume of "familiar letters" consequently fell into the background in the estimation of its author, who, though it went into several editions during his lifetime, never acknowledged it.

Such a popularity, of course, was not without its drawbacks. That it would lead to *Anti-Pamelas*, censures of *Pamela* and all the spawn of pamphlets which spring round the track of a sudden success, was to be anticipated. One of the results to which its rather sickly morality gave rise was the *Joseph Andrews* (1742) of Henry Fielding (q.v.). But there are two other works prompted by *Pamela* which need brief notice here. One is the *Apology for the Life of Mrs. Shamela Andrews*, a clever and very gross piece of rallery which appeared in April 1741, and by which Fielding is supposed to have alluded to *Joseph Andrews*. The second noteworthy result of *Pamela* was *Pamela's Conduct in High Life* (Sept. 1741), a spurious sequel by John Kelly of the *Universal Spectator*. Richardson tried to prevent its appearance, and, having failed, set about two volumes of his own, which followed in December, and professed to depict his heroine "in her exalted condition." It attracted no permanent attention.

About 1744 we begin to hear something of the progress of Richardson's second and greatest novel, *Clarissa*; or the *History of a Young Lady*, usually miscalled *Clarissa Harlowe*. The first edition was in seven volumes, two of which came out in Nov. 1747, two more in April 1748 and the last three in December. Upon the title-page of this, of which the mission was as edifying as that of *Pamela*, its object was defined as showing the distresses that may attend the misconduct both of parents and children in relation to marriage. Virtue, in *Clarissa*, is not "rewarded," but hunted down and outraged. The chief drawbacks of *Clarissa* are its merciless prolixity (seven volumes, which cover only 11 months); the fact that (like *Pamela*) it is told by letters; and a certain haunting and uneasy feeling that many of the heroine's obstacles are only molehills which should have been readily surmounted.

Between *Clarissa* and Richardson's next work appeared the *Tom Jones* of Fielding—a rival by no means welcome to the elder writer, although a rival who generously (and perhaps penitently) acknowledged *Clarissa's* rare merits.

Pectus inaniter angit,
Irritat, mulcet, falsis terroribus implet,
ut Magus

Fielding had written in the *Jacobite's Journal*. But even this could not console Richardson for the popularity of the "spurious brat" whom Fielding had made his hero, and his next effort was the depicting of a genuine fine gentleman—a task to which he was incited by a chorus of feminine worshippers. In the *History of Sir Charles Grandison*, "by the Editor of *Pamela* and *Clarissa*" (for he still preserved the fiction of anonymity), he essayed to draw a perfect model of manly character and conduct. In the pattern presented there is, however, too much buckram, too much ceremonial—in plain words, too much priggishness—to make him the desired exemplar of propriety in *excellent*. Yet he is not entirely a failure, still less is he to be regarded as no more than "the condescending suit of clothes" by which Hazlitt unfairly defines Miss Burney's Lord Orville. When Richardson delineated Sir Charles Grandison he was at his best, and his experiences and opportunities for inventing such a character were infinitely greater than they had ever been before. And he lost nothing of his gift for portraying the other sex. Harriet Byron, Clementina della Porretta and even Charlotte Grandison, are no whit behind *Clarissa* and her friend Miss Howe. *Sir Charles Grandison*, in fine, is a far better book than *Pamela*.

Grandison was published in 1753, and by this time Richardson was sixty-four. Although the book was welcomed as warmly as its predecessors, he wrote no other novel, contenting himself instead with indexing his works, and compiling an anthology of the "maxims," "cautions" and "instructive sentiments" they contained. To these things, as a professed moralist, he had always attached the greatest importance. He continued to correspond relentlessly with a large circle of worshippers, mostly women, whose counsels and fertilizing sympathy had not a little contributed to the success of his last two books. He was a nervous, highly strung little man, intensely preoccupied with his health and his feelings, hungry for praise when he had once tasted it, and afterwards unable to exist without it; but apart from these things, well meaning, benevolent, honest, industrious and religious. Seven vast folio volumes of his correspondence with his lady friends, and with a few men of the Young and Aaron Hill type, are preserved in the Forster library at South Kensington. Parts of it only have been printed. There are several good portraits of him by Joseph Highmore, two of which are in the National Portrait Gallery.

Richardson is the father of the novel of sentimental analysis. As Sir Walter Scott has said, no one before had dived so deeply into the human heart. No one, moreover, had brought to the study of feminine character so much prolonged research, so much patience of observation, so much interested and indulgent apprehension, as this twittering little printer of Salisbury Court. That he did not more materially control the course of fiction in his own country was probably owing to the new direction which was given to that fiction by Fielding and Smollett,

whose method, roughly speaking, was synthetic rather than analytic. Still, his influence is to be traced in Sterne and Henry Mackenzie, as well as in Miss Burney and Miss Austen, both of whom, it may be noted, at first adopted the epistolary form. But it was in France, where the sentimental soil was ready for the dressing, that the analytic process was most warmly welcomed. Extravagantly eulogized by the great critic, Diderot, modified with splendid variation by Rousseau, copied (unwillingly) by Voltaire, the vogue of Richardson was so great as to tempt French critics to seek his original in the *Marianne* of a contemporary analyst, Marivaux. As a matter of fact, though there is some unconscious consonance of manner, there is nothing whatever to show that the little-letter author of *Pamela*, who was also ignorant of French, had the slightest knowledge of Marivaux or *Marianne*. In Germany Richardson was even more popular than in France. Gellert, the fabulist, translated him; Wieland, Lessing, Herms, all imitated him, and Coleridge detects him even in the *Robbers* of Schiller. What was stranger still, he returned to England again under another form. The French *comédie larmoyante*, to which he had given a fillip, crossed the channel as the sentimental comedy of Cumberland and Kelly, which, after a brief career of prosperity, received its death-blow at the hands of Goldsmith and Sheridan.

Richardson's novels were edited by Mangin (19 vols., 1811), and an edition in 12 vols. was published by Sotheran in 1883 with preface by Sir Leslie Stephen. A *Collection of the Moral and Instructive Sentiments*, etc., was published in 1775. A selection from Richardson's *Correspondence* was published by Mrs. A. L. Barbauld in 1804, in six volumes, with a valuable Memoir. Recent lives are by Miss Clara L. Thomson, 1900, and by Austin Dobson ("Men of Letters"), 1902. A convenient reprint of the novels, with copies of the old illustrations by Stothard, Edward Burney and the rest, and an introduction by Mrs. E. M. McKenna, was issued in 1901 in 20 volumes.

(A. Do.; X.)

RICHBOROUGH, England, a port on the Stour, in Kent, 14 m. from Sandwich. Richborough castle is one of the most remarkable monuments of the Roman occupation of Great Britain. It marked the beginning of Watling street, and guarded the channel of the Wantsum, then separating the Isle of Thanet from the mainland. Richborough was a landing place and base for Roman legionaries. The extant remains of the castle include the north wall of the castellum, 460 ft. long and 22 ft. high. There is a cruciform platform of concrete, 144 ft. long and 104 ft. wide. It is believed to have borne a lighthouse. A subterranean passage runs round the foundations of the platform. In 1926 excavations revealed a double series of ditches surrounding the fortifications. During World War I, to relieve the traffic in military stores through Dover, the old port was re-established. Work began in 1916; the Stour was widened and deepened, a canal cut across a bend, and 250 ac. of marsh were reclaimed. Nearly a mile of wharfage was built and equipped. In six months regular cross-channel services of barges to Calais and Dunkirk were begun. In 1925 the port, with equipment, 1,500 ac. of land and the ferries and barges, was sold for development in connection with the Kent coalfields, but it eventually became derelict.

RICHELIEU, ARMAND EMMANUEL SOPHIE SEPTEMANIE DU PLESSIS, Duc de (1766-1822), French statesman, was born in Paris on Sept. 25, 1766, the son of Louis Antoine du Plessis, duc de Fronsac and grandson of the marshal de Richelieu (1696-1788). The comte de Chignon, as the heir to the Richelieu honours was called, was married at fifteen to Rosalie de Rochechouart, a deformed child of twelve, with whom his relations were never more than formal. After two years of foreign travel he entered the Queen's dragoons and next year received a place at court, where he had a reputation for Puritan austerity. He left Paris in 1790 for Vienna, and in company with his friend Prince Charles de Ligne joined the Russian army as a volunteer, reaching the Russian headquarters at Bender on the 21st of November. By the death of his father in February 1791, he succeeded to the title of duc de Richelieu. He returned to Paris shortly afterwards on the summons of Louis XVI., but he was not sufficiently in the confidence of the court to be informed of the projected flight to Varennes. In July he obtained a passport from the National Assembly for service in Russia. In 1803

he became governor of Odessa. Two years later he became governor general of the Chersonese, of Ekaterinoslav and the Crimea, then called New Russia. In the eleven years of his administration, Odessa rose from a village to an important city. The central square is adorned with a statue of Richelieu (1826). A magnificent flight of nearly 200 granite steps leads from the Richelieu monument down to the harbours.

Richelieu returned to France in 1814; on the triumphant return of Napoleon from Elba he accompanied Louis XVIII. in his flight as far as Lille, whence he went to Vienna to join the Russian army, believing that he could best serve the interests of the monarchy and of France by attaching himself to the headquarters of the emperor Alexander. As the personal friend of the Russian emperor his influence in the councils of the Allies was likely to be of great service. He refused, indeed, Talleyrand's offer of a place in his ministry, pleading his long absence from France and ignorance of its conditions; but after Talleyrand's retirement he succeeded him as prime minister.

The events of Richelieu's tenure of office are noticed elsewhere. (*See France: History*.) It was mainly due to his efforts that France was so early relieved of the burden of the allied army of occupation. It was for this purpose mainly that he attended the congress of Aix-la-Chapelle in 1818. There he had been informed in confidence of the renewal by the Allies of their treaty binding them to interfere in case of a renewal of revolutionary trouble in France; and it was partly owing to this knowledge that he resigned office in December of the same year, on the refusal of his colleagues to support a reactionary modification of the electoral law. After the murder of the duc de Berry and the enforced retirement of Decazes, he again became president of the council (Feb. 21, 1821); but his position was untenable owing to the attacks of the "Ultras" on the one side and the Liberals on the other, and on Dec. 12 he resigned. He died of apoplexy on May 17, 1822.

Part of Richelieu's correspondence, his journal of his travels in Germany and the Turkish campaign, and a notice by the duchesse de Richelieu, are published by the Imperial Historical Society of Russia, vol. 64. *See also* L. de Crousse-Cotté, *Le Duc de Richelieu en Russie et en France* (1897); L. Rioult de Neuville in the *Revue des questions historiques* (Oct. 1897); R. de Cisternes, *Le Duc de Richelieu, son action aux conférences d'Aix-la-Chapelle* (1898).

RICHELIEU, ARMAND JEAN DU PLESSIS DE, CARDINAL (1585-1642), French statesman, was born of an ancient family of the lesser nobility of Poitou. The cardinal's father, François du Plessis, seigneur de Richelieu (d. 1590), fought through the wars of religion, first as a favourite of Henry III., and after his death under Henry IV. His mother, Susanne de La Porte, belonged to a legal family. Armand was the third son and was born in Paris, Sept. 9, 1585. In 1606, at the age of twenty-one, he was nominated bishop of Luçon by Henry IV. As he was under the canonical age, he went to Rome to obtain a dispensation and was consecrated there in April 1607. In the winter of 1608 Richelieu went to his poverty-stricken little bishopric, and for the next six years devoted himself seriously to his episcopal duties. In 1614 he was elected by the clergy of Poitou to the last States-general which met before the Revolution. There he attracted the attention of Marie de' Medici, the queen-mother, and was chosen at its close to present the address of the clergy embodying its petitions and resolutions. After the States-general was dissolved he remained in Paris, and the next year he became almoner to Anne of Austria, the child-queen of Louis XIII. He was appointed in 1616 a secretary of state to the king. But he owed all to Concini, and his taste of power ended with the murder of his patron on Aug. 24, 1617.

The reign which Richelieu was to dominate so absolutely began with his exile from the court. He resigned himself to the post of chief adviser to Marie de' Medici in her exile at Blois. Here he sought to ingratiate himself with Luynes and the king by reporting minutely the actions of Marie and by protestations of loyalty. As this ungrateful work brought no reward, Richelieu retired once more to his bishopric. But he was exiled to Avignon, with his brother and brother-in-law, on April 7, 1618. There he wrote "A Defence of the Main Principles of the Catholic Faith," but

the escape of Marie de' Medici from Blois, on Feb. 22, 1619, again opened paths for his political ambition. Luynes and the king recalled him to the post at Angoulême with the queen-mother, who allowed him to sign the treaty of Angoulême with the Cardinal de la Rochefoucauld, acting for the king. By this treaty Marie was given liberty to live wherever she wished, and the government of Anjou and of Normandy with several castles was entrusted to her. Richelieu was made a cardinal by Pope Gregory XV, on Sept. 5, 1622.

Luynes's death on Dec. 15, 1621, made possible a reconciliation a month later between the king and his mother. Richelieu seized his opportunity. He furnished Marie de' Medici with political ideas and acute criticisms of the king's ministry, especially of the Brularts. Marie zealously pushed her favourite towards office, and eventually, in 1624, the king named him a member of his council. In August he became chief minister of Louis XIII.

Home Policy.—For the next eighteen years, he worked to make the royal power—his power—absolute and supreme at home, and to crush the rival European power of the Habsburgs. At home there were two opponents to be dealt with: the Huguenots and the feudal nobility. The former were crushed by the siege of La Rochelle and the vigorous campaign against the duc de Rohan. But the religious toleration of the edict of Nantes was reaffirmed while its political privileges were destroyed, and Huguenot officers fought loyally in the foreign enterprises of the cardinal. The suppression of the independence of the feudal aristocracy was inaugurated in 1626 by an edict calling for the destruction of castles not needed for defence against invasion. There was no serious opposition to the new minister. The first serious conspiracy took place in 1626, the king's brother, Gaston of Orleans, being the centre of it. His governor, Marshal D'Ornano, was arrested by Richelieu's orders, and then his confidant, Henri de Talleyrand, marquis de Chalais and Vendôme, the natural son of Henry IV. Chalais was executed and the marshal died in prison. The overthrow of the Huguenots in 1629 made Richelieu's position seemingly unassailable, but the next year it received its severest test. Marie de' Medici had turned against her "ungrateful" minister with a hatred intensified, it is said, by unrequited passion. In September 1630, while Louis XIII. was very ill at Lyons, the two queens, Marie and Anne of Austria, reconciled for the time, won the king's promise to dismiss Richelieu. He postponed the date until peace should be made with Spain. When the news came of the truce of Regensburg Marie claimed the fulfilment of the promise. On Nov. 10, 1630, the king went to his mother's apartments at the Luxembourg palace. Orders were given that no one should be allowed to disturb their interview, but Richelieu entered by the unguarded chapel door. When Marie had recovered breath from such audacity she proceeded to attack him in the strongest terms, declaring that the king must choose between him or her. Richelieu left the presence feeling that all was lost. The king gave a sign of yielding, appointing the brother of Marillac, Marie's counsellor, to the command of the army in Italy. But before taking further steps he retired to Versailles, then a hunting lodge, and there, listening to two of Richelieu's friends, Claude de Saint-Simon, father of the memoir writer, and Cardinal La Valette, sent for Richelieu in the evening, and while the salons of the Luxembourg were full of expectant courtiers the king was reassuring the cardinal of his continued favour and support. The "Day of Dupes," as this famous day was called, was the only time that Louis took so much as a step toward the dismissal of a minister who was personally distasteful to him but who was indispensable. The queen-mother followed the king and cardinal to Compiègne, but as she refused to be reconciled with Richelieu she was left there alone and forbidden to return to Paris. The next summer she fled across the frontiers into the Netherlands, and Richelieu was made a duke. Then Gaston of Orleans, who had fled to Lorraine, came back with a small troop to head a rebellion to free the king and country from "the tyrant." The only great noble who rose was Henri, duc de Montmorency, governor of Languedoc, and his defeat at Castelnaudary on the 1st of September

1632, was followed by his speedy trial by the parlement of Toulouse, and by his execution. Richelieu had sent to the block the first noble of France, the last of a family illustrious for seven centuries, the head of the nobility of Languedoc. He knew no mercy. The only other conspiracy against him which amounted to more than intrigue was that of Cinq Mars in 1642, at the close of his life. This vain young favourite of the king was treated as though he were really a formidable traitor, and his friend, De Thou, son of the historian, whose sole guilt was not to have revealed the plot, was placed in a boat behind the stately barge of the cardinal and thus conveyed up the Rhone to his trial and death at Lyons.

Foreign Policy.—Richelieu's foreign policy was as inflexible as his home policy. To humble the Habsburgs he aided the Protestant princes of Germany against the emperor, in spite of the strong opposition of the disappointed Catholic party in France, which had looked to the cardinal as a champion of the faith. The year of Richelieu's triumph over the Huguenots (1629) was also that of the Emperor Ferdinand's triumph in Germany, marked by the Edict of Restitution, and France was threatened by a united Germany. Richelieu, however, turned against the Habsburgs young Gustavus Adolphus of Sweden, paying him a subsidy of a million livres a year by the treaty of Bärwalde of Jan. 23, 1631. The dismissal of Wallenstein was of double value to Richelieu when his Swedish ally marched south. After the treaty of Prague, in May 1635, by which the emperor was reconciled with most of the German princes, Richelieu was finally obliged to declare war, and, concluding a treaty of offensive alliance at Compiègne with Oxenstierna, and in October one at St. Germain-en-Laye with Bernard of Saxe-Weimar, he proceeded himself against Spain, both in Italy and in the Netherlands. The war opened disastrously for the French, but by 1642, when Richelieu died, his armies,—risen from 12,000 men in 1621 to 150,000 in 1638—had conquered Roussillon from Spain; they held Catalonia, which had revolted from Philip IV. of Spain, and had taken Turin and forced Savoy to allow French troops on the borders of the Milanese. In Germany Torstensson was sweeping the imperialist forces before him through Silesia and Moravia. The lines of the treaty of Westphalia, six years later, were already laid down by Richelieu; and its epochal importance in European history is a measure of the genius who threw the balance of power from Habsburg to Bourbon.

Personality.—His own personality was his strongest ally. The king himself quailed before that stern, august presence. His pale, drawn face was set with his iron will. His frame was sickly and wasted with disease, yet when clad in his red cardinal's robes, his stately carriage and confident bearing gave him the air of a prince. His courage was mingled with a mean sort of cunning, and his ambition loved the outward trappings of power as well as its reality; yet he never swerved from his policy in order to win approbation, and the king knew that his one motive in public affairs was the welfare of the realm—that his religion, in short, was "reason of state."

No courtier was ever more assertive of his prerogatives. He claimed precedence over even princes of the blood, and one like Condé was content to draw aside the curtains for him to pass, and to sue for the hand of Richelieu's niece for his son, the "Great Condé." His pride and ambition were gratified by the foundation of a sort of dynasty of his nephews and nieces, whose hands were sought by the noblest in the realm. Like all statesmen of his time, Richelieu made money out of politics. He came to court in 1677 with an income of 25,000 livres from his ecclesiastical benefices. In the later years of his life it exceeded 3,000,000 livres. He lived in imperial state, building himself the great Palais Cardinal, now the Palais Royal, in Paris, another at Rueil near Paris, and rebuilding his ancestral château in Poitou. In January 1641 the tragedy of *Mirame*, which was said to have been his own, was produced with great magnificence. Richelieu was anxious for literary fame, and his writings are not unworthy of him. But more important than his own efforts as an author were his protection and patronage of literary men, especially of Corneille, and his creation of the French Academy

in 1635. When he died, on Dec. 4, 1642, he was buried in the chapel of the Sorbonne, which still stands as he built it. His tomb, erected in 1694, through rified at the Revolution, still exists.

Many writings are attributed to Richelieu, although owing to his habit of working with substitutes and assistants it is difficult to settle how much of what passes under his name is authentic. *Les Traictés, La Grande Puissance, Mêmes, and the other plays, have long been forgotten*; but a permanent interest attaches to his *Mémoires* and correspondence: *Mémoires d'Armand du Plessis de Richelieu, l'année 1607 à 1610*, ed. by A. Baschet (1880); *Histoire de la mère et du fils* (Marie de Medici and Louis XIII.), sometimes attributed to Mézeray (Amsterdam, 1730) and, under title *Histoire de la régence de reine Marie de Médicis, femme de Henry IV.* (The Hague, 1743); *Mémoires sur le règne Louis XIII.*, 1610 to 1638, and of which the earlier portion is a reprint of the *Histoire de la mère et du fils*, Petitot's collection (1823, seq.); *Testament politique d'Armand du Plessis, cardinal de R.* (Amsterdam, 1687, seq.); *Journal de 1630-31* (1645); "Lettres, instructions diplomatiques, et papiers d'état," publ. by d'Avenel in the *Coll. de doc. inéd.* (1853-77); these, with the *Mémoires* in J. F. Michaud and J. Poujault's collections, are the most important sources for Richelieu's statesmanship.

RICHELIEU, LOUIS FRANÇOIS ARMAND DU PLESSIS, Duc de (1616-1788), marshal of France, was a grandnephew of Cardinal Richelieu, and was born in Paris on March 13, 1696. As ambassador to Vienna (1725-29) he settled in 1727 the preliminaries of peace; in 1733-34 he served in the Rhine campaign. He fought with distinction at Dettingen and Fontenoy; three years afterwards he made a brilliant defence of Genoa; in 1756 he expelled the English from Minorca by the capture of the San Felipe fortress; and in 1757-58 he closed his military career by those pillaging campaigns in Hanover which procured him the sobriquet of *Petit Père de la Morande*. In his early days he was thrice imprisoned in the Bastille: in 1711 at the instance of his stepfather, in 1716 in consequence of a duel, and in 1719 for his share in Alberoni's conspiracy against the regent Orleans. He died in Paris on Aug. 8, 1788.

See H. Noel Williams, *The Fascinating Duc de Richelieu* (1910); L. A. F. du Plessis, *Mémoires authentiques du Maréchal de Richelieu, 1725-1757* (1918); P. d'Estrie, *Le Maréchal de Richelieu 1696-1788* (1917).

RICHEPIN, JEAN (1849-1926), French poet, novelist and dramatist, the son of an army doctor, was born at Medea (Algeria) on Feb. 4, 1849. He served as a *franco-tireur* in the Franco-German War, and was afterwards actor, sailor and stevedore. Richepin became famous with the publication, in 1876, of a volume of verse entitled *Chanson des gueux*; the outspokenness and the revolutionary defiance in these verses resulted in imprisonment and a fine for *outrage aux moeurs*. Later volumes were: *Les Carences* (1877), *Les Blasphèmes* (1884), *La Mer* (1886), *La Bombardée* (1890). His novels developed in style from the morbidity and brutality of *Les Morts bisarrées* (1876), *La Glu* (1881) and *Le Pave* (1883) to the more thoughtful psychology of *Grandes amoureuses* (1896) and *Lazibasse* (1899), and the more simple portrayal of life in *Marika* (1883), *Truandailles* (1890) and *Fiamboche* (1895). His best work is to be found in *Nana Sahib* (1883), in which he himself played with Sarah Bernhardt, *Monsieur Scapin* (1886), *Par le glaive* (1894), *Le Chevalier* (1897), *Le Chien de garde* (1898), *Les Truands* (1899), *Don Quichotte* (1905), most of which were produced at the Comédie française, of which he was for some time director. He also wrote *Marika* (1905), adapted from his novel, for the music of Alexandre Georges, and *Le Mage* (1897) for the music of Jules Massenet. He was director of the Académie française at

the time of his death. He died on Dec. 11, 1926. His son, Jacques Richepin (1880-1946), the author of *La Reine de Tyr* (1899), *Cadet-Roussel* (1903), *Falstaff* (1904) and *La Greve des Femmes* (1919) also made his mark on the stage.

RICHERUS (fl. 10th cent.), monk of St. Remi at Reims, and a chronicler of the 10th century, studied at Reims under Gerbert, afterwards Pope Sylvester II. He was still living in 998, but there is no mention of him after that date. His *Historia* has a unique value as giving us the only tolerably full account by a contemporary of the revolution of 987, which placed the Capets on the throne of France. From 969 onwards Richerus had no earlier history before him, and his work is the chief source for the period.

There are French translations by Guadet (1845, *Soc. de l'hist. de France*); Poinson (Reims, 1855, pub. de l'Académie de Reims).

RICHFIELD SPRINGS, a village of Otsego county, New York, U.S., 22 mi. S.E. of Utica, on federal highway 20, near the north end of Canadawaga lake; served by the Lackawanna railway. Pop. (1950) 1,534; (1940) 1,209 by the federal census. It is a health and summer resort, at an elevation of 1,500 ft. above sea level, in the midst of beautiful scenery, and supplied with sulphur springs, of value in rheumatism and skin diseases.

RICHMOND, EARLS AND DUKES OF. The title earl of Richmond appears to have been in existence in England a considerable time before it was held in accordance with any strict legal principle. Alan, surnamed "Le Roux," and his brother Alan (c. 1040-1089), surnamed "Le Noir," relatives of Geoffrey, count of Brittany, and kinsman of William the Conqueror, took part in the latter's invasion of England; and Le Roux obtained grants of land in various parts of England, including manors formerly held by Earl Edwin in Yorkshire, on one of which he built the castle of Richmond, his possessions there being formed into the honour of Richmond, to which his brother Alan Le Noir, or Alan Niger (c. 1045-1093), succeeded in 1089. The latter was in turn succeeded as lord of the honour of Richmond by Stephen (d. 1137), count of Penthièvre, who was either his son or another brother. These Breton counts are often reckoned as earls of Richmond, though they were not so in the strict and later sense. The same should perhaps be said of Stephen's son Alan Niger II. (c. 1116-1146).

This Alan married Bertha, daughter and heiress of Conan, reigning count of Brittany; and his son Conan (c. 1138-1171), who married Margaret, sister of Malcolm IV. of Scotland, asserted his right to Brittany, and transferred it in his lifetime to his daughter Constance (c. 1162-1201). As he left no sons the honour of Richmond and his other English possessions passed to the king in 1171, though Constance is also loosely spoken of as countess of Richmond in her own right. Constance was three times married, and each of her husbands in turn assumed the title of earl of Richmond, in conjunction with that of count, or duke of Brittany. They were: Geoffrey Plantagenet (1158-1186), son of Henry II., king of England; Randolph de Blundeville, earl of Chester (c. 1172-1232), the marriage with whom Constance treated as null on the ground of consanguinity; and Guy de Thouars (d. 1213), who survived his wife for 12 years. The only son of the first marriage, Arthur of Brittany (1187-1203), was styled earl of Richmond in his mother's lifetime, and on his murder at the hands of his uncle, King John, the earldom was resumed by the crown.

By her third husband Constance had two daughters, the elder of whom, Alice, was given in marriage by Philip Augustus, king of France, to Peter de Braine in 1213, after which date Peter was styled duke of Brittany and earl of Richmond till about 1235, when he renounced his allegiance to the king of England and thereupon suffered forfeiture of his English earldom.

In 1241 Henry III. granted the honour of Richmond to Peter of Savoy (1203-1268), uncle of Queen Eleanor, who was thereafter described as earl of Richmond by contemporary chroniclers, though how far he was strictly entitled to the designation has been disputed. By his will he left the honour of Richmond to his niece, the queen consort, who transferred it to the crown. In the same year (1268) Henry III. granted the earldom specifically to

John, duke of Brittany (1217-86), son of Peter de Braine, in whose family the title continued—though it frequently was forfeited or reverted to the crown and was re-granted to the next heir—till 1342, when it was apparently resumed by Edward III. and granted by that sovereign to his son John of Gaunt, who surrendered it in 1372. It was then given to John de Montfort, duke of Brittany, but on his death without heirs in 1399, or possibly at an earlier date through forfeiture, it reverted to the crown.

The earldom now became finally separated from the duchy of Brittany, with which it had been loosely conjoined since the Conquest, although the dukes of Brittany continued to assume the title till a much later date. From 1474 to 1485 the earldom of Richmond was held by John Plantagenet, duke of Bedford, and in 1485 it was conferred on Edmund Tudor, uterine brother to King Henry VI., whose wife, Margaret Beaufort, was the foundress of St. John's college, Cambridge, and of the "Lady Margaret" professorships of divinity at Oxford and Cambridge. (See RICHMOND AND DERRY, MARGARET, COUNTESS OF.) When Edmund Tudor's son Henry ascended the throne as Henry VII. in 1485, the earldom of Richmond merged in the crown, but in 1525 Henry Fitzroy, natural son of Henry VIII. by Elizabeth Blount, was created duke of Richmond and Somerset and earl of Nottingham, all these titles becoming extinct at his death without children in 1536.

Ludovic Stuart, 2nd duke of Lennox (1574-1624), who also held other titles in the peerage of Scotland, was created earl of Richmond in 1613 and duke of Richmond in 1623. These became extinct at his death in 1624, but his Scottish honours devolved on his brother Esme, who was already earl of March in the peerage of England. (See MARCH, EARLS OF; and LENNOX.) Esme's son, James, 4th duke of Lennox (1612-1655), was created duke of Richmond in 1647, the two dukedoms as well as the lesser English and Scottish titles thus becoming again united. In 1672, on the death of his nephew Charles, 3rd duke of Richmond and 6th duke of Lennox, whose wife was the celebrated beauty called "La Belle Stuart" at the court of Charles II. (See RICHMOND AND LENNOX, FRANCES TERESA STEWART, DUCHESS OF), his titles became extinct.

In 1675 Charles II. created his illegitimate son Charles duke of Richmond, earl of March and baron Settrington. This Charles (1672-1733), on whom his father the king bestowed the surname of Lennox, was the son of the celebrated Louise de Keroualle, duchess of Portsmouth. His son Charles, 2nd duke (1701-1750), added to the titles he inherited from his father that of duke of Aubigny in France, to which he succeeded in 1734 on the death of his grandmother the duchess of Portsmouth; these honours are still held by his descendant the present duke of Richmond.

The seven dukes of Richmond of the Lennox line have all borne the Christian name of Charles. The 2nd duke, by his marriage with Sarah, daughter of the 1st Earl Cadogan, was father of Lady Caroline Lennox, who eloped with Henry Fox, and was the mother of Charles James Fox, and of the beautiful Lady Sarah Lennox (1745-1826) with whom George III. fell in love and contemplated marriage, and who afterwards married, first, Sir Thomas Bunbury, from whom she was divorced, and secondly George Napier, by whom she was the mother of Generals Sir Charles and Sir William Napier.

Charles, 3rd duke of Richmond (1734-1806), was famous for his advanced views on the question of parliamentary reform. Having succeeded to the peerage in 1750, he was appointed British ambassador extraordinary in Paris in 1765, and in the following year he became a secretary of State in the Rockingham administration, resigning office on the accession to power of the earl of Chatham. In the debates on the policy that led to the War of American Independence Richmond was a firm supporter of the colonists. Richmond also advocated a policy of concession in Ireland, with reference to which he originated the famous phrase "a union of hearts." In 1779 the duke brought forward a motion for retrenchment of the civil list; and in 1780 he embodied in a bill his proposals for parliamentary reform, which included manhood suffrage, annual parliaments and equal electoral areas. Richmond sat in Rockingham's second cabinet as

master-general of ordnance; and in 1784 he joined the ministry of William Pitt. He now developed strongly Tory opinions, and his alleged desertion of the cause of reform led to a violent attack on him by Lauderdale in 1792. Richmond died in Dec. 1806, and, leaving no legitimate children, he was succeeded in the peerage by his nephew Charles.

The 5th duke (1791-1860), while still known by the courtesy title of earl of March, served on Wellington's staff in the Peninsula, being at the same time member of parliament for Chichester. He was afterwards a vehement opponent in the House of Lords of Roman Catholic emancipation, and at a later date a leader of the opposition to Peel's free trade policy. In 1836, on inheriting the estates of his maternal uncle, the 5th and last duke of Gordon, he assumed the name of Gordon before that of Lennox. On his death in 1860 he was succeeded in his titles by his son Charles Henry, 6th duke of Richmond (1818-1903), a statesman who held various cabinet offices in the Conservative administrations of Lord Derby, Disraeli and the marquess of Salisbury; and who in 1876 was created earl of Kinrara and duke of Gordon. These honours in addition to the numerous family titles of more ancient creation passed on his death in 1903 to his son Charles Henry Gordon-Lennox (1845-1928), 7th duke of Richmond and Lennox and 2nd duke of Gordon. The 7th duke was succeeded by his son Charles Henry Gordon-Lennox (1870-1935).

RICHMOND, LEGH (1772-1827), English divine, was born on Jan. 29, 1772, at Liverpool, and was educated at Cambridge. He wrote *The Dairyman's Daughter*, of which as many as four millions in nineteen languages were circulated before 1849. A collected edition of his stories was first published in 1814 under the title of *Annals of the Poor*. He died May 8, 1827.

See T. S. Grimshawe, *A Memoir* (1828); T. Fry, *Domestic Portraiture* (1835).

RICHMOND, SIR WILLIAM BLAKE, (1842-1921), English painter and decorator, was born in London on Nov. 29, 1842. At the age of 14 William Richmond entered the Royal Academy schools, where he worked for about three years. A visit to Italy in 1859 had an important effect upon his development. His first Academy picture was a portrait group (1861), and several other pictures of the same class followed. In 1865 he returned to Italy, and spent four years there, living chiefly at Rome. On his return in 1869 he exhibited "A Procession in Honour of Bacchus" at the Academy. He became Slade professor at Oxford, succeeding Ruskin, in 1878, but resigned three years later. He was elected A.R.A. in 1888 and R.A. in 1895; he received the degree of D.C.L. in 1896, and became professor of painting to the Royal Academy. Apart from his pictures, he is notable for his work in decorative art, his most conspicuous of St. Paul's cathedral. He died at Hammersmith on Feb. 11, 1921. His portrait by George Phoenix is in the National Portrait Gallery. He was created a K.C.B. in 1897.

See *The Richmond Papers*, ed. A. M. W. Stirling (1926).

RICHMOND, a municipal and parliamentary borough in Surrey, England, 9 mi. W.S.W. of Charing Cross, London. Pop. (est. 1938) 38,280. Area, 6.6 sq.mi. It lies on the right bank of the Thames.

Richmond was anciently called Syenes and afterwards Schene and Sheen (a name preserved in the village of East Sheen, adjacent on the London side) until the name was in 1500 changed

to Richmond by command of Henry VII, who was earl of Richmond in Yorkshire. It grew up round the royal manor house, of which nothing but a gateway remains. Edward I received the Scotch commissioners at his manor of Sheen in 1300. The palace was rebuilt by Edward III, who died here in 1377. It was frequently used by Richard II, who afterwards caused it to be demolished. By Henry V, however, it was rebuilt, and a great tournament was held here in 1492 by Henry VII, who after its destruction by fire in 1498 restored it. Henry VIII gave it to Wolsey to reside in, after the latter presented him with the new palace of Hampton Court. James I settled it on his son Henry, prince of Wales, who restored it. Charles I added to it the new deer park, Richmond park, 2,258 acres in extent surrounded by a wall. After the execution of the king, the parliament presented the park to the citizens of London, who again presented it to Charles II at the Restoration. Though partly dismantled, the palace was the residence of the queen dowager till 1665, but it was parcelled into tenements about 1720. In the old deer park extending northwards from the site of the palace, Few observatory was erected in 1769, occupying the site of a Carthusian convent founded by Henry V. The White Lodge was built by George I. A theatre, first established in 1719, was during his later years leased by Edmund Kean. Richmond was incorporated in 1890 and after 1918 returned one member to parliament, the parliamentary borough including Barnes and Ham.

RICHMOND, a municipal borough in the North Riding of Yorkshire, England, 15 mi. S.W. of Darlington by a branch of the L.N.E. railway, of which it is the terminus. Pop. (1951) 6,165. Area 3.9 sq.mi. It is situated on the left bank of the Swale, where the valley is still narrow and steep-sided before it emerges from the Pennines into the Vale of York.

The town is chiefly interesting because of the castle, which occupies the summit of a high cliff. The castle was founded about 1071 by Alan Rufus of Penhèvière in Brittany, who is said to have rebuilt the town on obtaining from William the Conqueror the estates of the Saxon earl Edwin, which embraced some two hundred manors of Richmond and extended over nearly a third of the North Riding. This tract was called Richmondshire at this time, but the date of the creation of the shire is uncertain. William the Lion of Scotland was imprisoned in the castle in the reign of Henry II.; otherwise the town owes its importance chiefly to its lords. It was a valuable possession in the middle ages, and was usually in royal or semi-royal hands. The whole shire reverted to the crown on the accession of Henry VII. Henry VIII. gave it to his son Henry, afterwards Duke of Richmond, and the title was also bestowed upon a son of Charles II. The original castle covered an area of 5 acres, but the only portions remaining are the Norman keep, with pinnacled towers and walls 100 ft. high by 21 ft. thick, and some smaller towers.

The name of Richmond (Richemont, Richemund) has not been traced further back than 1145, but it is probable that there was an earlier settlement on the site. As far as is known, the earliest charter was granted in 1145 giving the burgesses the borough of Richmond to hold for ever in fee farm at an annual rent of £29, but a charter dated 1146 shows that the burgesses had enjoyed some municipal liberties at an earlier period. Other charters were granted in 1150 and in 1268, the latter pointing to the existence of a market at Richmond, but there is no grant of it extant. In 1278, a yearly fair was granted and in 1328, Edward III. gave the first Royal Charter to the town.

A charter of incorporation, under the title of aldermen and burgesses was granted in 1576 by Queen Elizabeth, who also allowed a market each Saturday, an animal market every fortnight, and a fair each year on the vigil of Palm Sunday. In 1668, Charles II. granted a charter under the title of mayor and aldermen. This charter, though superseded later, was restored in the reign of James II., and, until the passing of the Municipal Reform Act of 1835, was regarded as the governing charter of the borough. Although Richmond received a summons as early as 1328, it was not represented in parliament until 1584, from which time it usually sent two members. In 1867, the number was reduced to one, and since 1885 the representation has been

merged in the Richmond division of the North Riding. In 1889, Richmond became the seat of a bishop suffragan in the diocese of Ripon, but the second and last bishop died in 1921.

The church of St. Mary is transitional Norman, Decorated and Perpendicular, and is largely restored. The church of the Holy Trinity is ancient and was restored to use from ruins; only the nave and a detached tower remain. The tower of a Franciscan abbey, founded in 1258, still exists. Close to the town are the ruins of Easby Abbey, a Premonstratensian foundation of 1152, beautifully situated by the river. The remains include a Decorated gateway, an Early English chapel and fragments of the transepts and choir of the church, with sufficient portions of the domestic buildings to enable the complete plan to be traced.

The free grammar school existed in 1390, and was refounded in 1567, but the present building dates from 1850.

The principal trade is in agricultural produce, and as Richmond possesses the only railway station in Swaledale, the market is still important.

See R. Eale, *Registrum Honoris de Richmond* (1722); C. Clarkson, *History and Antiquities of Richmond* (Richmond 1821); T. D. Whitaker, *A History of Richmondshire* (1832); *Victoria County History: Yorkshire*.

RICHMOND, a city of Contra Costa county, California, U.S., on the eastern shore of San Francisco bay, 8 mi. N.E. of San Francisco, with which it is connected by the San Francisco-Oakland bay bridge.

Richmond is served by the Southern Pacific and Santa Fe railways, and has a busy harbour. The population was 99,545 in 1950 and it was 23,642 in 1940 by the federal census. Richmond is an important industrial centre.

Major industries include the assembling of automobiles, petroleum refining, railroad shops, and the manufacturing of building supplies, chemicals, explosives, machinery, tanks, dairy products and many other commodities.

Richmond was established in 1890, when the Santa Fe railway purchased a right-of-way to the bayshore, and was incorporated in 1905.

The city is under the council-manager form of government.

RICHMOND, a city of Indiana, U.S., 68 mi. E. of Indianapolis, near the Ohio state line, on the east branch of the White-water river; the county seat of Wayne county. It is on federal highways 27, 35 and 40, and is served by the Chesapeake and Ohio and the Pennsylvania railways, by air lines and motor bus. Population (1950) 39,539. The city has broad, well shaded streets, several parks and substantial public buildings. It is the seat of a state hospital for the insane (1890) and of several charitable institutions under religious auspices. Adjoining its western boundary is the beautiful campus (120 ac.) of Earlham college, established in 1847 by the Society of Friends. Richmond has a large wholesale trade and important manufacturing industries. Richmond was founded by Quakers from North Carolina and Pennsylvania, and for many years was the principal centre of the Society of Friends west of Philadelphia. Settlement began in the vicinity in 1806. In 1816, the year Indiana became a state, Richmond was platted as a town.

Richmond was incorporated as a village in 1818 and chartered as a city in 1840.

RICHMOND, a city of eastern Kentucky, U.S., the county seat of Madison county; 125 mi. S.E. of Louisville, on federal highway 25 and the Louisville and Nashville railroad. Pop. 10,268 in 1950; 7,335 in 1940 by the federal census. It is in the blue-grass region, near the foothills of the Cumberland mountains, about 1,000 ft. above sea level. There is a sulphur spring in the heart of the city. Natural gas is available, and hydroelectric power from the development on the Dix river. Richmond is an important market for thoroughbred livestock and burley tobacco. A miniature-lamp plant is there, and 3 mi. away is Blue Grass ordnance depot, a U.S. ammunition storage installation.

Richmond is the seat of the U.S. Trachoma hospital (1926) and of the Eastern Kentucky state college (1906) with a 50-ac. campus, formerly occupied by Central university (founded 1874,

and consolidated in 1901 with Centre college at Danville). The trail marked in 1770 by Squire Boone, who preceded his brother Daniel, passed through Richmond, over what is now the Dixie highway, and one of the huge sandstone slabs on which he cut an inscription is now in the courthouse yard. Along this trail was fought the battle of Richmond (Aug. 30, 1862) when the Confederate Gen. Edmund Kirby Smith won a decisive victory. Fort Boonesborough (erected 1775) and the town founded by Daniel Boone were about 12 mi. S. of Richmond. There are many fine old mansions in the city and its environs.

RICHMOND, the capital and largest city of Virginia, U.S., a port of entry, the county seat of Henrico county (but administratively independent of it) and from 1861 to 1865 the capital of the Confederate States of America; at the head of navigation on the James river, 100 mi. S. by W. of Washington, D.C. It is on federal highways 1, 33, 60, 259, 301 and 360; and is served by the Atlantic Coast Line, the Chesapeake and Ohio, the Richmond, Fredericksburg and Potomac, the Seaboard Air Line, the Norfolk and Western and the Southern railways; also by American, Capital, Eastern, National and Piedmont air lines. Pop. (1950) 229,906; (1940) 193,042 by federal census.

The city is attractively built around a bend in the James. The original site, embracing seven hills on the north side of the river, has been extended by annexations in all directions (including the city of Manchester on the south side in 1910) until the area is 40 sq.mi. Four highway and four railroad bridges cross the James within the city limits. There are numerous islands, including Belle Isle, the site of a Confederate prison during the Civil War, and Mayo's Island. Projects were completed in 1940 for straightening the bends in the river and deepening the channel to 25 ft. between Richmond and Hampton Roads. The state capitol, standing in a 12-ac. square, was built (1785-92) after designs prepared from a model and plans of the Maison Carrée at Nîmes, which Thomas Jefferson secured while he was minister to France. It contains the Houdon statue of Washington (1796) and a replica of the bust of Lafayette by Houdon, which was presented by Virginia to the city of Paris. In this building Aaron Burr was tried (1807), the Virginia secession convention met (1861) and the sessions of the Confederate congress were held. The oldest building in the city is a stone dwelling erected prior to 1700, now the Edgar Allan Poe shrine. St. John's Episcopal church (1741) was the meeting place of the Virginia convention of 1775, before which Patrick Henry made his famous speech ending, "Give me liberty or give me death!" Jefferson Davis was attending services in St. Paul's church when word reached him (April 2, 1865) from Lee that Richmond must be evacuated. The executive mansion of the Confederacy, occupied by Jefferson Davis 1861-65, a house built in 1819, is now a Confederate museum. The home of Chief Justice John Marshall (built in 1795) and the wartime residence of Lee's family also house historical collections. The Valentine museum, devised by Mann S. Valentine in 1892 as a public trust, includes many books of the 15th and 16th centuries. The state library, completed in 1940, has a collection of old manuscripts. The Father Tabb library commemorates this poet.

Richmond is an important educational centre. The public schools have an annual budget of \$6,500,000, not including the Virginia Mechanics' institute, founded in 1856. The University of Richmond (1832), including Richmond college for men, Westhampton college for women, school of business administration and the T. C. Williams school of law, has an extensive campus in the western suburbs of the city. The Union Theological seminary (Presbyterian, 1824) moved to Richmond in 1898. The Medical College of Virginia (1838) is one of the oldest medical schools in the south. Virginia Union university for Negroes (created in 1899) combines Wayland seminary (1865), Richmond Theological seminary (1886) and Hartshorn Memorial college. The Richmond Professional institute has extension classes of the College of William and Mary and the Virginia Polytechnic institute. The daily papers (both Democratic) are the *Times-Dispatch*, formed in 1903 by the consolidation of the *Dispatch* (1850) and the *Times* (1886), and the *News-Leader* (1896).

The city has 18 public parks, covering 908 ac., and 42 play-

grounds for children. There are many fine monuments and statues, among them the Washington monument in Capitol square, designed and largely executed by Thomas Crawford, and the noble equestrian statue of Robert E. Lee by M. J. A. Mercie. In Hollywood cemetery are the graves of Jefferson Davis, James Monroe, John Tyler, John Randolph of Roanoke, Commodore Matthew F. Maury, several Confederate generals and 16,000 Confederate soldiers. Oakwood cemetery contains the graves of 18,000 Confederate soldiers. Two miles northeast of the city is a national cemetery with 6,600 graves of Union men, most of whom were killed in the actions around Richmond.

Richmond has a city manager form of government with a city council of nine members elected from the city at large; one of the councilmen serves as honorary mayor. It owns and operates its water, gas and electric plants and had an annual budget of \$35,000,000 at mid-20th century. A city plan and zoning ordinances are in effect. The assessed valuation of property subject to taxation was \$481,412,077 in 1950. Richmond is the financial and commercial metropolis of a large area of the south and the leading manufacturing city of Virginia. It is the seat of the federal reserve bank of the fifth district. Bank debits in 1950 amounted to \$6,151,000,000 and postal receipts totalled \$5,389,000. The wholesale and jobbing houses do an annual business of \$69,000,000. Richmond is one of the oldest tobacco markets in the United States. Its principal manufactures are cigars, cigarettes and other tobacco products. More than 100,000,000 cigarettes are produced in the city annually. Principal industries, ranked according to employment, are: cigarettes and tobacco products; chemicals, including rayon and cellophane; food and kindred products; apparel and textiles; paper and paper products; iron and steel; printing and publishing.

History—Richmond was projected in 1733 by Col. William Byrd, owner of much land along the James, who held important offices in the colony and was the author of some of the best accounts of contemporary scenes and events and whose family has been conspicuous in the history of Virginia since 1637. He was an ancestor of Harry F. Byrd, governor 1926-30, and of Richard E. Byrd (q.v.), explorer. An exploring party from Jamestown had sailed up the river in 1607 and erected a cross on one of the small islands there; a short-lived settlement had been made within the present city limits in 1609, and a second had been attempted 3 mi. below by Capt. John Smith on land he bought from the Indians. In 1645 Fort Charles had been built as a frontier defense at the falls. Colonel Byrd (who had been educated in England) called the town Richmond, probably because of the similarity of its site to that of Richmond on the Thames. It was laid out in 1737 by Maj. William Mayo and was incorporated as a town in 1742. In 1777 the public records were brought there from Williamsburg, and in May 1779 Richmond was made the capital of the state. The town was partly burned on Jan. 5, 1781, by British troops under Benedict Arnold. It was chartered as a city in 1782. At the opening of the Civil War it was an important port and commercial centre, with a population of about 38,000. On May 8, 1861, it was made the capital of the Confederacy, and for the next four years was the objective of military operations to which the greatest leaders and the finest armies were devoted. (See AMERICAN CIVIL WAR.) The city was defended by three encircling lines of fortifications. On March 1, 1862, President Davis placed it under martial law, together with the environs within a radius of 10 mi. The opening of G. B. McClellan's peninsular campaign (see YORKTOWN) in 1862 caused great apprehension in Richmond, and preparations were made to ship the government records to a safer place. On the approach of the "Monitor" and the Union gunboats many persons fled from the city, and President Davis appointed a day of prayer. Confidence was restored by the checking of the fleet at Drewry's bluff on May 15, 1862, the battle of Fair Oaks and the Seven Days (q.v.). In May 1864 Grant began the final campaign against Richmond. (See PETERSBURG CAMPAIGN; WILDERNESS.)

On the fall of Petersburg (April 2, 1865), Richmond was evacuated after the ironclads, the bridges and many of the tobacco

and military warehouses had been set on fire. When the Federal troops made their entrance the next morning a serious conflagration was under way, which was not extinguished until a third of the city was in ruins. The Tredegar iron works, still a leading industry of Richmond, was the principal iron foundry of the Confederacy, where most of the cannon were cast. A tobacco warehouse and ship-chandlery (built in 1845 by Luther Libby) was used as a prison, chiefly for Federal officers, throughout the war. Frequently it was terribly overcrowded, housing at times as many as 1,200, and the sufferings and the death-rate were high. In 1888-89 Libby prison was moved to Chicago to be a war museum. Within 25 years after the close of the war the population of Richmond had doubled (reaching 81,388 in 1890), \$14,000,000 was invested in manufacturing plants, annual jobbing sales amounted to \$31,500,000 and bank clearings to \$93,500,000. In the next 30 years (1890-1920) the population doubled again.

RICHMOND AND DERBY, MARGARET, COUNTESS OF (1443-1509), mother of the English king, Henry VII., and foundress of St. John's and Christ's colleges at Cambridge, was the daughter and heiress of John Beaufort, duke of Somerset, and was born on May 31, 1443. In 1455 she married Edmund Tudor, earl of Richmond, who died in the following year; she then married Henry (d. 1482), son of Humphrey Stafford, duke of Buckingham, and later Thomas Stanley, afterwards earl of Derby. She was in constant communication with her son, the future Henry VII., during his exile in Brittany, and with her husband, Lord Stanley, aided him to gain the crown in 1485. Under the influence of her confessor, John Fisher, afterwards bishop of Rochester, the countess founded the Lady Margaret professorships of divinity at the universities of Oxford and Cambridge. She completed the foundation of Christ's College, Cambridge, and much of her wealth was left for building and endowing St. John's College in the same university. She died on the 29th of June 1509.

See C. H. Cooper, *Memoir of Margaret, Countess of Richmond and Derby* (1874).

RICHMOND AND LENNOX, FRANCES TERESA STEWART, DUCHESS OF (1648-1702), daughter of a physician in the household of Queen Henrietta Maria when she was in exile after 1649, was born in 1648 and was brought up in France. Henrietta Maria sent her to England, where she was appointed maid of honour to Catherine of Braganza, queen of Charles II. Charles II. became infatuated with her, and it is stated that in 1667 he was considering the possibility of obtaining a divorce in order to make her his wife. This was at a time when he feared to lose her as his mistress, since her hand was sought in marriage by Charles Stuart, duke of Richmond and Lennox. In March 1667 she eloped with Richmond and married him secretly; but on her return to court she retained her hold on the king's affections.

RICHMOND RIVER AND BASIN, together with the basins of the Tweed and Clarence Rivers, forms the largest area of coastal lowland in New South Wales, Australia (c. 125 miles N.-S.; 30-40 miles east-west). The area contains most of the productive portions of the North Coast Division which has 65% of its total area (6,900,000 ac.) occupied, contains nearly half of the dairying holdings and makes nearly 60% of the butter (1925-26: 63,000,000 lb.) made in the State (e.g., the butter factory at Byron Bay is said to be the largest in Australia). The whole of the sugar produced in New South Wales is grown in this area (1925-26: 8,700 acres [cut], yielding 297,000 tons cane or 123,500 tons raw sugar and molasses). The district is linked by rail with Sydney (North Coast Railway) and a through connection with Brisbane is being constructed from Kyogle.

RICHTER, EUGEN (1839-1906), German politician, was born on July 30, 1839 at Düsseldorf. After attending the universities of Bonn, Heidelberg and Berlin, he entered the Government service. In 1864 he was chosen burgomaster of Neuwied; but he was already known for his Liberal opinions, and the Government refused to confirm the appointment and transferred him to Bromberg, in East Prussia. In consequence, he resigned from the public service, went to Berlin and entered journalism. A

consistent advocate of the economic doctrines of the Manchester School, he was also keenly interested in the working-class co-operative movement, on which he wrote a book. In 1867 he was tried for revolutionary tendencies but acquitted. In 1867 he was elected a member of the Reichstag, and in 1869 of the Prussian parliament. A member of the Progressive party, in 1880 one of the founders, and eventually the leader, of the Freisinnige, he was always in opposition. Next to Windthorst he was Bismarck's most dangerous opponent, and leader of the opposition to the introduction of protection, to the new colonial policy introduced after 1878, and to State Socialism. He also strongly opposed all increases in the army and navy; and it was his opposition to the army measures of 1893 which finally split his party, leaving him with only a small following. In 1885 he founded the *Freisinnige Zeitung*, which he edited himself; he also wrote many political brochures and works on Prussian finances. He died at Jena, on Jan. 26, 1906.

See his reminiscences *Jugenderinnerungen* (1892) and *Im alten Reichstag* (2 vols., 1894-96).

RICHTER, HANS (1843-1916), Hungarian musical conductor, born at Raab on April 4, 1843, was the son of the kapellmeister at the cathedral, whose wife, née Josephine Czakinsky, was an operatic singer. He studied (1860-65) at the Vienna Conservatoire.

In 1871 Richter was appointed conductor of the Hungarian National Opera at Budapest, and in May 1875 began his long connection with the Vienna Opera, which terminated only with the century. In 1876 he directed the rehearsals and performances of *Der Ring* at Bayreuth, and in 1877 paid his first visit to England to conduct the Wagner Festival at the Albert Hall. There in 1879 he founded the Richter Concerts and quickly established himself as a prime favourite with the London musical public. Later, in 1892, he conducted a famous series of performances of Wagner's works (including the first in England of *Die Meistersinger* and *Tristan*) at Drury Lane; while special performances of German opera were also conducted by him at Covent Garden from 1904 onwards. In 1900 he became conductor of the Hallé Orchestra in Manchester doing splendid service in this capacity, while previously in 1885 he had established an equally happy connection with Birmingham as conductor of the Birmingham Triennial Festival. His last performance of *Die Meistersinger* was given at Bayreuth in 1911, and his last years were spent in retirement there. He died on Dec. 5, 1916. As a conductor Richter was supreme in the interpretation of Wagner, though hardly less great in that of Mozart, Beethoven, Brahms and all the other great classical masters.

RICHTER, JOHANN PAUL FRIEDRICH (1763-1825), usually called **JEAN PAUL**, famous German author, was born at Wunsiedel, in Bavaria, on March 21, 1763. His father was a school master and organist at Wunsiedel, but in 1765 he became a pastor at Joditz near Hof, and in 1776 at Schwarzenbach, where he died in 1779. After attending the gymnasium at Hof, Richter went in 1781 to the university of Leipzig. Unable to maintain himself at Leipzig he returned in 1784 to Hof, where he lived with his mother. From 1787 to 1789 he served as a tutor at Töpen, a village near Hof; and afterwards he taught the children of several families at Schwarzenbach.

Richter's first work was *Gründliche Prosaesse und Auswahl aus des Teufels Papieren*, the former of which was issued in 1783-84, the latter in 1789. In later life Richter had little sympathy with their satirical tone. His next book, *Die unsichtbare Loge*, a romance, published in 1793, had all the qualities which were soon to make him famous, and its power was immediately recognized. He then produced in rapid succession *Hesperus* (1795), *Biographische Belustigungen unter der Gehirnschale einer Rastin* (1796), *Leben des Quintus Fixlein* (1796), *Blumen-Frucht- und Dornenstücke, oder Elend und Tod und Hochzeit des Armenadvokaten Siebenhäus* (1796-97), *Der Jubelseniör* (1797), and *Das Kampaner Tal* (1797). This series of writings won for Richter an assured place in German literature.

In 1797 he went to Leipzig, and in the following year to Weimar, where he had much pleasant intercourse with Herder, by whom he

was warmly appreciated. He did not become intimate with Goethe and Schiller, to both of whom his literary methods were repugnant; but in Weimar, as elsewhere, his good talk and genial manners made him a favourite in general society. In 1807 he married Caroline Meyer, whom he met in Berlin in 1800. They lived first at Meiningen, then at Coburg; and finally, in 1804, they settled at Bayreuth. Here Richter spent a quiet, simple and happy life, constantly occupied with his work as a writer. In 1808 he was delivered from anxiety as to outward necessities by the prince-primate, K. T. von Dalberg, who gave him a pension of a thousand florins. Before settling at Bayreuth, Richter had published his most ambitious novel *Titan* (1800-3); and this was followed by *Flegeljahre* (1804-5), two works which he himself regarded as his masterpieces. His later imaginative works were *Dr. Katzenbergers Badereise* (1809), *Des Feldpredigers Schmelze*, *Reise nach Pläts* (1809), *Leben Fibels* (1812), and *Der Komet, oder Nikolaus Marggraf* (1820-22). In *Vorsuche der Aesthetik* (1804) he expounded his ideas on art; he discussed the principles of education in *Levana, oder Erziehungstheorie* (1807); and the opinions suggested by current events in *Friedenspredigt* (1808), *Dämmerungen für Deutschland* (1809), *Mars und Phobus Thronwechsel im Jahre 1814* (1814), and *Politische Fastenpredigten* (1817). In his last years he began *Wahrheit aus Jean Pauls Leben*, to which additions from his papers and other sources were made after his death by C. Otto and E. Förster. In 1821 Richter lost his only son, and never quite recovered from the shock. He died of dropsy, at Bayreuth, on Nov. 14, 1825.

Schiller said of Richter that he would have been worthy of admiration "if he had made as good use of his riches as other men made of their poverty." And it is true that in the form of his writings he never did full justice to his great powers. In working out his conceptions he found it impossible to restrain the expression of any powerful feeling by which he might happen to be moved. He was equally unable to resist the temptation to bring in strange facts or notions which occurred to him. Hence every one of his works is irregular in structure, and his style lacks directness, precision and grace. But he had an amazingly fertile imagination and a surprising power of suggesting great thoughts by means of the simplest incidents and relations. Richter was a great nature-lover and deeply religious in spirit; to him visible things were but the symbols of the invisible, and in the unseen realities alone he found elements which seemed to him to give significance and dignity to human life. His humour, the most distinctive of his qualities, cannot be dissociated from the other characteristics of his writings. It determined to some extent the form in which he embodied even his most serious reflections. It is sometimes extravagant and grotesque but never harsh or vulgar, and generally it springs naturally from the perception of the incongruity between ordinary facts and ideal laws. With all his wilfulness and eccentricity Richter was a man of a pure and sensitive spirit, with a passionate scorn for pretence and an ardent enthusiasm for truth and goodness.

Richter's *Sämtliche Werke* appeared in 1826-28 in 60 vols., to which were added 5 vols. of *Literarischer Nachlass* in 1836-38. Editions of selected works appeared in 16 vols. (1865), in Kürschner's *Deutsche Nationalliteratur* (edited by F. Nerrlich, 6 vols., 1884-87). The chief collections of Richter's correspondence are: *Jean Pauls Briefe an F. H. Jacobi* (1828); *Briefwechsel Jean Pauls mit seinem Freunde C. Otto* (1829-33); *Briefwechsel zwischen H. Voss und Jean Paul* (1833); *Briefe an eine Jugendfreundin* (1838); F. Nerrlich, *Jean Pauls Briefwechsel mit seiner Frau und seinem Freunde Otto* (1902). See further the continuation of Richter's autobiography by C. Otto and E. Förster (1836-33); R. O. Spazler, J. P. F. Richter: *ein biographischer Kommentar zu dessen Werken* (5 vols., 1833); F. J. Schneider, *Jean Pauls Altersdichtungen* (1901), and *Jean Pauls Jugend und erstes Auftreten in der Literatur* (1906). All Richter's more important works have been translated into English, *Quintus Fideles* and *Schmelze* by Caryl; see also Caryl's two admirable essays on Richter.

RICHTHOFEN, FERDINAND, BARON VON (1833-1905), German geographer and traveller, was born near Karlsruhe, Silesia, on May 5, 1833. He was educated at Breslau and Berlin, and in 1856 carried out geological investigations in the Tirol, subsequently extending them to Transylvania. In 1859 he accompanied as geologist the Prussian diplomatic mission to the Far East under Count von Eulenburg, and visited Ceylon, Japan, Formosa,

the Philippines and Java, subsequently making an overland journey from Bangkok to Moulemein and reaching Calcutta in 1862. No important work resulted from these travels, for much of Richtshofen's records and collections was lost. China was at the time inaccessible owing to the Taiping rebellion, but Richtshofen was impressed with the desirability of exploring it, and after a visit to California, where he remained till 1868, he returned to the East. In a remarkable series of seven journeys he penetrated into almost every part of the Chinese Empire. He returned home in 1872, and a work comprising three large volumes and an atlas, which, however, did not cover the entire field or complete the author's plan, appeared at Berlin in 1877-85 under the title of *China; Ergebnisse eigener Reisen und darauf gegründeter Studien*. In this standard work the author deals not only with geology but with every subject necessary to a general geographical treatise. Notably he paid close attention to the economic resources of the country he traversed; he wrote a valuable series of letters to the Shanghai Chamber of Commerce, and first drew attention to the importance of the coalfields of Shantung, and of Kiaochow as a port. In 1875 Richtshofen was elected professor of geology at Bonn, but being fully occupied with his work in China he did not take up professional duties till 1879; in 1883 he became professor of geography at Leipzig, and in 1886 was chosen to the same office at Berlin, and held it till his death. He died Oct. 16, 1905.

Among his other works are: *Natural System of Volcanic Rocks* (San Francisco, 1867); *Aufgaben und Methoden der heutigen Geographie* (an address delivered at Leipzig, 1883); *Führer für Forschungsreisende* (Berlin, 1886); *Triebkräfte und Richtungen der Erdoberfläche in neunzehnten Jahrhundert* (address on his election as rector, Berlin, 1903).

RICHWOOD, a city of Nicholas county, West Virginia, U.S., 60 mi. E. of Charleston, on the Baltimore and Ohio railroad. The population was 5,321 in 1930 and 5,051 in 1940 by the federal census.

Richwood is in a farming and timber region in the foothills of the Alleghenies, and has lumber and paper mills, coal mines and wood-working factories. The town was founded and incorporated in 1901, and in 1921 was chartered as a city.

RICIMER (d. 472), master of the Roman Empire in the West during part of the fifth century, was the son of a prince of the Suebi and the daughter of Wallia, king of the Visigoths. His youth was spent at the court of Valentinian III., and he won distinction under Aetius. In 456 he defeated the Vandals in a sea-fight near Corsica, and on land near Agrigentum in Sicily. He then gained the consent of the Roman senate to an expedition against the emperor Avitus, whom he defeated at Piacenza on Oct. 16, 456. Ricimer then obtained from Leo I., emperor at Constantinople, the title patrician, but in 457 set up Majorianus as his own emperor in the West. When, however, Majorianus tried to rule by himself, Ricimer forced him to abdicate and caused his assassination on Aug. 7, 461. The successor whom Ricimer placed upon the throne was Libius Severus, who proved to be more docile than Majorianus. Upon his death in 465—said to be due to the poison of Ricimer—this emperor-maker ruled the West for eighteen months without an emperor, and then accepted Leo's candidate Anthemius. Before long, however, Ricimer moved to Milan, ready to declare war upon Anthemius. St. Epiphanius, bishop of Milan, patched up a truce, but in 472 Ricimer proclaimed as emperor Olybrius, whom Leo had sent to pacify the two enemies, and after three months' siege captured Rome, on July 1, 472. Anthemius was massacred and Rome was a prey to Ricimer's soldiers. He himself, however, died on Aug. 18, 472, of malignant fever.

The main authorities for this period are collected in Mommsen's *Chron. Minora* (3 vols., 1829-38). See also Gibson ed. *Bury* (London, 1907) p. 15-49. L. M. Hartmann, *Geschichte Italiens im Mittelalter*, vol. i. (1897).

RICINA, an ancient town of Picenum, Italy, 3 m. N.W. of the modern Macerata, on the banks of the river Potenza, in a fertile valley. After it was refounded by Pertinax and Septimius Severus, it bore the name Colonia Helvia Ricina Pertinax. Considerable ruins of an amphitheatre and remains of baths and other buildings (all of the imperial period) still exist; also the

fragments of an ancient bridge over the Potenza.

RICKETS, a disease of children and young animals characterized by deficient calcification of the bones and teeth and by other evidences of perverted nutrition (see METABOLIC DISEASES). Rickets most commonly attracts attention about the end of the first year of life but the bony changes are preceded by digestive disorder. The child's appetite is poor, and there is frequent vomiting, with diarrhoea and wasting. A common early symptom is profuse sweating of the head, particularly during sleep, with a tendency in the child to kick off all coverings and expose the limbs. There is great tenderness of the bones, as shown by the pain produced on moving or handling the child. Gradually changes in the shape of the bones become obvious about the epiphyseal lines at the ends of the long bones. Thus in the arm there is enlargement at the wrists, and in the ribs a knobbed appearance at the junction of their ends with the costal cartilages. The bones from their lack of calcium salts become misshapen, by the action of the muscles and the superincumbent weight of the body. Those of the limbs are bent outwards and forwards, and the child becomes "bow-legged" or "in-kneed." The trunk shows alterations and deformities owing to curvature of the spine, flattening of the lateral curves of the ribs, and projection forwards of the sternum ("pigeon breast"). The pelvis undergoes distortion, which may reduce its diameters to a degree that in the female may afterwards lead to difficulties in parturition. The head of the rickety child is large-looking in its upper part, the individual bones of the cranium sometimes remaining long ununited, while the face is small and ill-developed, and the teeth appear late and fall out or decay early. The spleen often is enlarged. Commonly, the disease terminates in recovery, with more or less deformity and dwarfing, the bones although altered in shape becoming firmly ossified. But during the progress of the disease, various intercurrent ailments may cause death, such as the infectious fevers, bronchitis and other pulmonary affections, chronic hydrocephalus, convulsions, laryngismus stridulus, etc. Rickets is now recognized to be largely if not entirely due to deficiency of vitamin D in the food (see VITAMINS). The treatment is directed toward the supply of this deficiency, e.g., by cod liver oil, exposure to sunlight or in its absence to ultra-violet light. Recently ergosterol which has been exposed to ultra-violet radiation, has been introduced to replace cod-liver oil. In addition general hygienic and nutritive measures must be adopted. Unduly prolonged suckling and artificial—especially starchy—foods given before the infant is able to digest them, are often noted in the histories of rickety children.

An acute form of rickets of rare occurrence (really a form of scurvy, *q.v.*) has been described, in which all the symptoms develop rapidly, the result in many instances being fatal.

The condition formerly known as foetal rickets (achondroplasia or chondrodystrophia foetalis) is now classed as a separate disease. Its chief characteristics are dwarfism with shortening of the limbs and enormous enlargement of the articulations.

RICKETTS, CHARLES (1866-1931), English artist, was born at Geneva on Oct. 2, 1866, and educated in France. In 1889 he became joint editor with Charles Shannon of the *Diak*. In 1896 he founded the Vale press, the output of which was a series of beautifully designed and printed books. Of his pictures, "The Plague" (1911) is in the Luxembourg at Paris, and "Don Juan" (1916) in the National Gallery. He published *The Prado and its Masterpieces* (1903); *A Bibliography of the Books issued by Hacon and Ricketts* (1904); *Titian* (1906); *Pages on Art* (1913).

RICKMAN, THOMAS (1776-1841), English architect, was born on June 8, 1776, at Maidenhead, Berkshire, and died at Birmingham on Jan. 4, 1841. He designed many churches, the new court of St. John's College, Cambridge and a palace for the bishop of Carlisle. These are all in the Gothic style, but show more knowledge of its outward form than real acquaintance with its spirit. Rickman played a part in the revival of mediævalism perhaps second only to Pugin. His *Attempt to discriminate the Styles of Architecture in England* ran through many editions.

RICKMANSWORTH, an urban district in Hertfordshire, England; 17½ mi. W.N.W. of London by the Met. and L.N.E. Jt. railway; served also by the L.M.S.R. Pop. (1938) 18,700. Area,

12.3 sq.mi. William Penn, founder of Pennsylvania, lived during 1672-76 in Basing house, in the High street, now the council offices. In 1937 the council purchased the mansion and grounds (345 ac.) of Moor park as part of the London Green Belt scheme. The Royal Masonic Institution for girls was opened here in 1934.

RICOCHET, a military term expressing the rebound of a projectile that strikes on a hard surface. The origin of the French word *ricochet* is unknown. Its earliest known use (14th and 15th centuries) was in the sense of "repetition," e.g. *chanson du ricochet*, "an oft-told tale." Hence it came to be applied to the rebound of a flat stone skimmed along the surface of water, known familiarly in English as "ducks and drakes," and so finally in the military sense, which found its way into the English language. The use of the now obsolete "ricochet fire" in war is well illustrated by "ducks and drakes." The shot, striking the ground at a small angle, described for the remainder of its course a succession of leaps and falls. The discovery of this species of fire, usually attributed to Vauban (siege of Ath in 1697), had the greatest influence both on sieges and on operations in the field. In siege warfare, ricochet, especially when combined with enfilade, i.e. when directed along the enemy's line of defence, soon became the principal weapon of the besieger, and with the system of parallels gave the attack a superiority so complete that a siege came to be considered as the most certain operation of war. Enfilade fire by itself was neutralized by traverses in the defenses, but by the new method a shot could be so aimed as to skip over each successive traverse and thus to search ground that was immune from direct fire. The application of ricochet fire to operations in the field came somewhat later. In the 18th century field artillery, which was not, before Napoleon's time, sufficiently mobile to close with the enemy, relied principally upon the ricochet of round shot, which, sweeping a considerable depth of ground, took effect upon several successive lines of hostile troops. But once artillery was able to gallop up to the enemy and to use its far more terrible close-range projectile, case-shot, ricochet fire came to be used less and less, until finally, with the general adoption of shell (which, of course, burst at the first contact with the ground), the round shot disappeared altogether from the battlefield. Similarly in siege warfare, as soon as high-angle fire with shells became sufficiently accurate, there was no further need of round shot and ricochet.

The term "ricochet" is now only applied, in modern rifle shooting, to the graze of a bullet that has struck short. A modern bullet that has ricocheted inflicts a very severe wound, as its nickel or other hard envelope is torn and jagged by its contact with the ground. With its high remaining velocity it is dangerous even after more than one ricochet, except at extreme ranges.

RICOLD OF MONTE CROCE (1242-1320), Italian Dominican missionary, was born at Monte Croce, near Florence. In 1267 he entered the Dominican house of Santa Maria Novella in Florence, and in 1272 that of St. Catherine in Pisa. He started for Acre with a papal commission to preach in 1286 or 1287; in 1288 or 1289 he began to keep a record of his experiences in the Levant; this record he probably reduced to final book form in Baghdad. He travelled extensively in Syria, Asia Minor and Persia. In Baghdad he stayed several years, studying the Koran and other works of Moslem theology, for controversial purposes, arguing with Nestorian Christians, and writing. In 1301 Ricold again appeared in Florence: some time after this he proposed to submit his *Confutatio Alcorani* to the pope, but did not. He died on Oct. 31, 1320.

The best edition of the *Itinerary* is by J. C. M. Laurent, in *Peregrinatores Medii Aevi Quatuor*, pp. 105 (101)-41 (Leipzig, 1864 and 1873). The *Epistles* have been edited by R. Röhrich in *Archives de l'Orient latin*, vol. II, part II. (Documents) pp. 258-96 (Paris, 1884). The *Confutatio Alcorani*, printed at Seville in 1500, at Venice in 1607, adds hardly anything to the sections of the *Itinerary* devoted to Moslem belief, etc. Ricold's *Libellus contra Nationes Orientales et Contra errores Judaeorum* have never been printed. See also C. Raymond Beazley, *Dawn of Modern Geography*, III, 190-202, 218, 390-397, 547, 554, 564.

RICOTTI-MAGNANI, CESARE (1822-1905), Italian general and knight of the Annunziata, was born at Borgo Lazzeraro on June 30, 1822. After serving from 1856 to 1859 as

director of the artillery school, he became general of division in 1804, commanding the 5th division at the battle of San Martino. In the war of 1866 he stormed Borgofero, to open a passage for Cialdini's army. Upon the death of General Govone in 1872 he was appointed minister of war, and after the occupation of Rome bent all his efforts to army reform, in accordance with the lessons of the Franco-German War. He shortened the period of military service; extended conscription to all able-bodied men; created a permanent army, a mobile militia and a reserve; commenced the renewal of armaments; and placed Italy in a position to put 1,800,000 men on a war footing. Ricotti fell from power with the Right in 1876, but returned to office with Depretis in 1884, and amended his previous scheme of reform. Resigning in April 1887, he became a member of the senate in 1890, but took little part in public life until 1896, when, after the battle of Adowa, he formed a ministry; he made over the premiership to the marquis di Rudini, retaining for himself the portfolio of war, and sought to consolidate the tactical structure of the army without weakening its fighting power. Ricotti's ideas were not acceptable at court, and he had to resign. Nevertheless, his prestige as creator of the modern Italian army remained unimpaired.

RIDDELL, GEORGE ALLARDICE RIDDELL, 1st Baron (1865-1934), British newspaper proprietor, was born in London on May 25, 1865, and educated privately. He became a solicitor in 1888 and settled in practice at Cardiff. There he acquired an interest in *The Western Mail*, and he eventually turned his energies mainly to newspaper management. He went to London and obtained control over the Sunday paper *The News of the World*, which he developed on popular lines, so that it obtained a huge circulation during the first decade of the 20th century and made its proprietor a wealthy man. He gradually extended his newspaper connections, becoming a director also of George Newnes Ltd., Country Life Ltd. and C. Arthur Pearson Ltd., etc. In 1909 he received a knighthood. He was a prominent member of the Newspaper Proprietors' Association at the outbreak of the World War, and, owing to his intimate relations with Mr. Lloyd George, he gradually became the principal liaison between the Press and the Government so far as all matters of public concern were concerned. In this capacity he represented the British Press at the Peace Conference in 1919 and at all the important Allied conferences subsequently. He was created a baronet in 1918 and raised to the peerage as Baron Ridwell of Walton Heath in 1920. His publications include *Some Things That Matter* (1922) and *More Things That Matter* (1925).

RIDGEFIELD PARK, a village of Bergen county, New Jersey, U.S., 6 mi. W. of the Hudson river, opposite New York city (about 200th street). It is served by the New York, Susquehanna and Western and the West Shore railroads and bus lines. Pop. (1950) 11,993. It is a residential and industrial suburb with paper mills and factories on the Hackensack river.

RIDGEWOOD, a village of Bergen county, New Jersey, U.S., 22 mi. N.W. of New York city and 5 mi. N.E. of Paterson on the Erie railroad. Pop. (1950) 17,481; in 1940, federal census, 14,948. It is a parklike residential community in the foothills of the Watchung and the Ramapo mountains. The village, originally called Godwinville, was incorporated in 1894 and in 1911 a commission form of government was established.

RIDGWAY, a borough of northern Pennsylvania, U.S., the county seat of Elk county; midway between Buffalo and Pittsburgh, on the Clarion river at the mouth of Elk creek. It is on federal highways 120 and 219, and is served by the Baltimore and Ohio and the Pennsylvania railroads. Pop. (1950) 6,244; (1940) 6,233; (1930) 6,313. The borough has an altitude of 1,380 ft. and covers nearly 3 sq. mi. It is in a natural gas field.

Manufactures include electric motors and generators, glue, ink, lumber products, bearings, brake linings and snow plows. Ridgway was founded in 1824 by Jacob Ridgway of Philadelphia and incorporated in 1880.

RIDING, THRITHING or THRIDING, a Scandinavian term for the third part of a shire or county, e.g., the ridings of Yorkshire and of Lindsey in Lincolnshire. In Iceland the third

part of a thing which corresponds roughly to an English county was called *thrithjungur*; in Norway, however, the *thrithjungur* seems to have been an ecclesiastical division. To the riding causes were brought which could not be determined in the wapentake, and a matter which could not be determined in the riding was brought into the court of the shire. There is abundant evidence that riding courts were held after the Norman Conquest.

Each of the ridings of Yorkshire has its own lord lieutenant and commission of the peace, and under the Local Government Act of 1888 forms a separate administrative county. They are distinguished as the north, east and west ridings, but the ancient divisions of Lindsey were known as the north, south and west ridings respectively.

See Dugdale, *Monasticon Anglicanum*, vol. vi. ed. by John Caley and others (1846); F. Liebermann, *Die Gesetze der Angelsachsen* (Halle, 1888-89); Stubbs, *Constitutional History of England*.

RIDING; see HORSEMANSHIP AND RIDING.

RIDLEY, NICHOLAS (c. 1500-1555), English bishop and martyr, was the second son of Christopher Ridley of Unthank Hall, near Willemoteswick, Northumberland. He was sent about 1518 to Pembroke Hall, Cambridge. Having graduated M.A. in 1526 he went to study at the Sorbonne in Paris and at Louvain, and on his return to Cambridge was appointed junior treasurer of his college. In 1534 he was one of the university proctors, and signed the decree of the university against the jurisdiction of the pope in England. Ridley was now chaplain to the university and began to show leanings to the reformed faith. In 1537 he became chaplain to Thomas Crammer, archbishop of Canterbury, and in April 1538 vicar of Herne, Kent. In 1540 he was chosen master of Pembroke Hall; in 1541 he became chaplain to Henry VIII. and canon of Canterbury. In 1543 he was accused of heretical teaching and practices but acquitted, although just after his exculpation he finally abandoned the doctrine of transubstantiation.

In September 1547 Ridley was nominated bishop of Rochester. He was one of the visitors who were appointed to establish protestantism in the University of Cambridge; in 1548 helped to compile the English prayer book, and in 1549 was one of the commissioners who examined Bishops Gardiner and Bonner. He concurred in their deprivation, and succeeded Bonner in the see of London. Having signed the letters patent settling the English crown on Lady Jane Grey, Ridley, in a sermon preached at St. Paul's cross on July 9th, 1553, affirmed that the princesses Mary and Elizabeth were illegitimate, and that the succession of the former would be disastrous to the religious interests of England. When Lady Jane's cause was lost, however, he went to Framlingham to ask Queen Mary's pardon, but was at once arrested and sent to the Tower of London. From his prison he wrote in defence of his religious opinions, and early in 1554 he, with Crammer and Latimer, was sent to Oxford to be examined. He defended himself against a number of divines, but was declared a heretic and excommunicated. He refused to recant, and in Oct. 1555 he was tried for heresy under the new penal laws, being degraded and sentenced to death. With Crammer and Latimer he met his end at the stake in Oxford on Oct. 16, 1555.

See *Works of Nicholas Ridley D.D.* (ed. H. Christmas, Parker Soc., 1841). His *Life* was written by Dr. Gloucester Ridley in 1763, and there is a memoir of him in Moulle's edition of the bishops' *Declaration of the Lord's Supper* (1895).

RIDOLFI or RMDOLFO, ROBERTO DI (1531-1612), Italian conspirator, born at Florence on Nov. 18, 1531, settled in London about 1555. In 1570 he set to work on the plot against Elizabeth which is usually associated with his name. His intention was to marry Mary, queen of Scots, to the duke of Norfolk and to place her on the English throne. In 1571 he visited the duke of Alva at Brussels, Pius V. at Rome, and Philip II. at Madrid to explain to them his scheme and to gain their active assistance thereto. His messenger, by name Charles Bailie (1542-1625), was, however, seized at Dover; Norfolk and Lesley were arrested, the former being condemned to death in January 1572. Ridolfi, who was then in Paris, died at Florence on Feb. 18, 1612.

RIEGER, PHILIPP FRIEDRICH VON (1818-1903), Bohemian politician and publicist, was born on Dec. 18, 1818, at

Semil, Bohemia. He first came into prominence as one of the Czech leaders in the revolution of 1848. In 1853 he married a daughter of the historian Palacky. In 1858 he started the *Slovnik naučny*, the Czech national encyclopaedia and also helped to found the first Czech political daily newspaper published in Prague (1861), of which he was for a while the editor. After the issue of the "October diploma" of 1860, Rieger, with Palacky, undertook the leadership of the reconstituted Czech party. In 1871 he conducted the negotiations with the Hohenewarth ministry for a federal constitution of the empire, which broke down owing to his extreme attitude in the matter of Bohemian independence. On the reappearance of the Czechs in the Bohemian diet (1878) and the Austrian *Reichsrath* (1879) Rieger, as chief of the so-called "Old Czechs," supported Count Taaffe's government. In 1891, together with the other "Old Czechs," he was defeated at the poll. In March 1897 he was created a baron (*Freiherr*) and given a seat in the Upper House, but his influence was now at an end. He died on March 3, 1903.

RIEL, LOUIS (1844-1885), Canadian agitator, son of Louis Riel and Julie de Lagemaundière, was born at St. Boniface, on Oct. 23, 1844, according to his own account, though others place his birth in 1847. Though known as a half-breed, or Métis, and though with both Indian and Irish ancestors, his blood was mainly French. From July 1866 he worked for two years at various occupations in Minnesota, returning in July 1868 to St. Vital, near St. Boniface. In 1869 the transfer of the territorial rights of the Hudson's Bay Company to the dominion of Canada gave great uneasiness to the Métis, and in October 1869 a party led by Riel turned back at the American frontier the newly appointed Canadian governor; in November they captured Fort Garry (Winnipeg), the headquarters of the Company, and called a convention which passed a bill of rights.

In December a provisional government was set up, of which on Dec. 29, Riel was made president, and which defeated two attacks made on it by the English-speaking settlers of the vicinity. So far the Métis had been within their rights, but Riel was flighty, vain and mystical, and his judicial murder on March 4, 1870, of Thomas Scott, an Orangeman from Ontario, roused against him the whole of English-speaking Canada. An expedition was equipped and sent out under Colonel Garnet, later Lord Wolsley, which captured Fort Garry on Aug. 24, 1870, Riel decamping.

Riel was not arrested, and on Aug. 4, 1871, urged his countrymen to combine with the Canadians against a threatened attack from American Fenians, for which he was publicly thanked by the lieutenant-governor. In 1872 for religious reasons he changed his name to Louis David Riel. In October 1873 he became member of the dominion parliament for Provencher, came to Ottawa and took the oath, but did not sit. On April 16, 1874, he was expelled from the house, but in September was again elected for Provencher; on Feb. 10, 1875, he was outlawed, and the seat thereby again vacated. In 1877-78 he was for over a year a patient in the Beauport asylum for the insane, but from 1879 to 1884 he lived quietly in Montana.

In 1884 in response to a deputation from the Métis, who had moved west to the forks of the Saskatchewan river, he returned to Canada to win redress for their wrongs. His own rashness and the ineptitude of Canadian politicians and officials brought on a rising, which was crushed after some hard fighting, and on May 15, 1885, Riel surrendered. He was imprisoned at Regina, was tried and on Aug. 1 found guilty of treason, and on Nov. 16 was hanged at Regina, meeting his fate with courage. His death was the signal for a fierce outburst of racialism in Quebec and Ontario, which nearly overthrew the Conservative government.

See J. S. Willison, *Str Wilfrid Laurier*, vol. 1; George Bryce, *History of the Hudson's Bay Company* (1900); and the Canadian daily press for 1885.

RIEMANN, GEORG FRIEDRICH BERNHARD (1826-1866), German mathematician, was born on Sept. 17, 1826, at Breselenz, near Dannenberg in Hanover.

In 1840 he went to Hanover, where he attended the lyceum and two years later he entered the Johanneum at Lüneburg. The

director, Schmalfluss, encouraged him in his mathematical studies by lending him books (among them Euler's works and Legendre's *Theory of Numbers*). In 1846 Riemann entered the university of Göttingen, where, although supposed to be studying theology, he attended lectures on the numerical solution of equations and on definite integrals by M. A. Stern, on terrestrial magnetism by Goldschmidt, and on the method of least squares by K. F. Gauss. In 1847 he went to Berlin, where P. G. L. Dirichlet, C. G. J. Jacobi, J. Steiner and F. G. M. Eisenstein were professors. During this period he formed those ideas on the theory of functions of a complex variable which led to his great discoveries.

In 1850 he returned to Göttingen and in 1851 obtained his doctorate with his celebrated thesis "Grundlagen für eine allgemeine Theorie der Functionen einer veränderlichen complexen Grösse."

In his Habilitationsschrift on the "Representation of a Function by Means of a Trigonometrical Series," Riemann shows his usual originality and refined style. The subject of his trial lecture, chosen by Gauss, was "On the Hypotheses which form the Foundation of Geometry." (See GEOMETRY: *Non-Euclidean*.) This wonderful work was published in the *Göttinger Abhandlungen* (1868) and a translation by Clifford in *Nature* (vol. 8).

Riemann's health had never been strong and now under the strain of work he broke down, and retired to the Harz with his friends Ritter and R. Dedekind, where he gave himself up to excursions and "Naturphilosophie." After his return to Göttingen (Nov. 1857) he was made extraordinary professor, and his salary raised to 300 thalers. Before this he had been in very straitened circumstances, and in 1855 was granted a government stipend of 200 thalers. On Dirichlet's death in 1859, Riemann was appointed his successor in Göttingen. He died at Selasca, on Lake Maggiore, on July 20, 1866. Most of his memoirs are masterpieces—full of original methods, profound ideas and far-reaching imagination. See RIEMANNIAN GEOMETRY below.

The collected works of Riemann were published by H. Weber, assisted by R. Dedekind (8vo, Leipzig, 1876; 2nd ed., 1892).

RIEMANNIAN GEOMETRY. Any n independent variables x_i where i takes the values 1 to n , may be thought of as the coordinates of an n -dimensional space, or variety V_n , in the sense that each set of values of the x 's defines a point of V_n . In a space as thus defined there is not an *a priori* basis for the determination of magnitude nor for the comparison of directions at two different points. Riemann proposed the study of the metric properties of a general V_n by introducing as the basis for measurement a quadratic differential form

$$\sum_{i,j} g_{ij} dx_i dx_j,$$

where the g 's are functions of the x 's, subject to the restrictions that the determinant of the g 's is not zero and that for all values of the differentials the above sum is positive. By definition the distance ds between the points of coordinates x_i and $x_i + dx_i$ is given by

$$ds^2 = \sum_{i,j} g_{ij} dx_i dx_j. \quad (1)$$

This is a generalization of the first fundamental form of a surface in ordinary space when the surface is defined in terms of two parameters, as proposed by GAUSS (see DIFFERENTIAL GEOMETRY). In this case the metric on the surface is induced by the Euclidean metric of the enveloping space, whereas in a general Riemannian space the metric is assigned.

From the hypotheses concerning (1) it can be shown that at any point

$$1, \dots, \sum_{i,j} g_{ij} \frac{\partial x_i}{\partial s} \frac{\partial x_j}{\partial s}$$

is less than unity for two different sets of differentials dx_i and δx_i . Consequently a real angle θ is determined by the equation

$$\cos \theta = \sum_{i,j} g_{ij} \frac{\partial x_i}{\partial s} \frac{\partial x_j}{\partial \delta s}. \quad (2)$$

by definition it is the *angle* between the directions at the point determined by the two sets of differentials. This is in keeping with the fact that the cosine of the angle between two tangents, at a point, to a surface in ordinary space when expressed in terms of the induced metric, is given by an equation of the form (2).

When we have n independent functions ϕ_i of the x 's the equations

$$x'_i = \phi_i(x_1, \dots, x_n) \quad (i=1, \dots, n)$$

define a transformation of coordinates of the space. If the g 's in (1) are such, which is rarely the case, that by a suitable transformation the form (1) is reducible to

$$ds^2 = \sum_{i=1}^n (dx^i)^2, \quad (3)$$

which is a generalization of the metric of ordinary space in cartesian coordinates, we say that the space is flat, or *plane*; otherwise it is *curved*. The locus of points defined by

$$x_1 = f_1(t), \dots, x_n = f_n(t)$$

for all values of the parameter t is called a *curve*. When these expressions are substituted in (1), we obtain an expression of the form $ds^2 = F(t)dt^2$, and then the length of arc of the curve is given by integration. If the result of the integration is $s = \phi(t)$, by means of this equation the coordinates at points of the curve are expressible as functions of the arc s as parameter. The theory of curves involves $n-1$ principal curvatures, which are generalizations of the curvature and torsion of a curve in ordinary space.

Using the terminology of the calculus of variations, we say that the extremals of the integral

$$\int \left(\sum_{i,j=1}^n g_{ij} \frac{dx_i}{ds} \frac{dx_j}{ds} \right)^{1/2} ds$$

are the shortest lines, or *geodesics*, of the space. The geodesics are found to be the integral curves of a system of differential equations

$$\frac{d^2 x_i}{ds^2} + \sum_{j,k=1}^n \Gamma_{j,k}^i \frac{dx_j}{ds} \frac{dx_k}{ds} = 0 \quad (i=1, \dots, n), \quad (4)$$

where the Γ 's are certain functions of the g 's and their first derivatives. When the space is flat and the coordinates are those for which the fundamental form is (3), all the functions Γ vanish identically. Consequently in the coordinate system the equations of the geodesics of the flat space are

$$x_i = a_i s + b_i, \quad (i=1, \dots, n), \quad (5)$$

where the a 's and b 's are constants. Thus the geodesics of a Riemannian space are the analogues of straight lines of a Euclidean space. Riemann showed that in a general space a coordinate system exists such that all the geodesics through a given point are defined by $a_i s$ ($i=1, \dots, n$) = 1, but those through other points are not given by (5). In such a coordinate system the Γ 's vanish at the given point, but not their derivatives.

Two sets of differentials dx_i and dx_j determine two directions at a point, and $adx_i + bdx_j$, where a and b are parameters, a linear pencil of directions at the point. The geodesics issuing from a point P as a linear pencil of directions constitute a surface; the Gaussian curvature (see DIFFERENTIAL GEOMETRY) of this surface at P was taken by Riemann as the measure of curvature of the space for the given pencil. It is expressed in terms of the directions, and the components of a tensor of the fourth order, which involves the functions $\Gamma_{j,k}^i$ and their first derivatives; it is now known as the *Riemannian curvature tensor* (see TENSOR ANALYSIS). Ordinarily the curvature varies with the choice of the pencil. Schur showed that, if it is the same for all pencils at each point of the space, then it has the same value at every point; these are the spaces of constant Riemannian curvature; when, and only when, the constant is zero, the space is flat.

From time to time important contributions to Riemannian geometry were made by Bianchi, Beltrami, Christoffel, Voss and others, and Ricci co-ordinated and extended the theory simultaneously with the development of tensor calculus. These contributions include the study of a sub-space of a Riemannian space analogous to that of a surface in ordinary space. Such a sub-space of order r is the locus of points defined by the equations

$$x_i = \psi_i(x_1, \dots, x_r) \quad (i=r+1, \dots, n), \quad (6)$$

where the ψ 's are independent parameters. When these expressions are substituted in (1), we obtain an induced metric for the sub-space—a generalization of the first fundamental differential form of a surface (see DIFFERENTIAL GEOMETRY). There is also a generalized second fundamental form, whose coefficients enter in the relations between the curvatures of a curve in the sub-space relative to the latter and the curvatures of the curve as of the enveloping space. Among the curves of the sub-space there are geodesics, lines of curvature, asymptotic lines and conjugate systems of curves, which are generalizations of these types of curves on a surface in ordinary space. Einstein based his theory of gravitation upon the assumptions that physical space and time constitute a four-dimensional continuum whose metrical character is determined by the presence of matter, and that these spaces are of a particular kind defined in invariant form by means of the curvature tensor; in this theory the fundamental form (1) is not positive for every choice of the differentials. This and other physical interpretations of differential geometry of spaces have stimulated the development of the theory.

Notable among contributions is the concept of parallelism of vectors in a general Riemannian space as introduced by Levi-Civita (1873–1949). In such a space parallelism is not absolute, as it is in Euclidean space, but is relative to the curve joining the points of application of the vectors. Thus for a curve $x_i = f_i(s)$ each set of solutions of the equations

$$\frac{dx_i}{ds} + \sum_{j,k=1}^n \Gamma_{j,k}^i \frac{dx_j}{ds} \frac{dx_k}{ds} = 0 \quad (i=1, \dots, n) \quad (7)$$

are the components of a family of vectors at the points of the curve which are parallel to one another with respect to the curves. Certain Riemannian spaces admit one or more fields of vectors, such that any two of them are parallel with respect to any curve joining their points of application. When, there are n independent fields of this kind, the space is flat. In particular, the tangents to a geodesic are parallel with respect to the geodesic, as follows from (7) and (4), when we put

$\frac{dx_i}{ds}$, geodesics are the straight lines of the space. This concept of parallelism is involved in many of the recent developments of Riemannian geometry and its generalizations have opened up new fields (see TENSOR ANALYSIS).

One type of generalization of Riemannian geometry is that in which there is no assigned metric, but the basic concept is a generalization of geodesic lines. These curves, called *paths* by Veley and Eisenhart, are defined by equations of the form (4), in which now the quantities $\Gamma_{j,k}^i$ are assigned, and not derived as in the case of geodesics from the quadratic form (1). When the same interpretation is put upon the functions $\Gamma_{j,k}^i$ in equations (7), there is a curve defined and parallel in this geometry, and the paths, straight lines, in the sense that all the tangents to a path are parallel to one another with respect to the path (see AFFINE GEOMETRY). From this basis a geometry has been developed in many respects analogous to Riemannian geometry which Eisenhart termed Non-Riemannian geometry. This term may be applied, however, to other geometries. For example, Finley in his Goettingen Dissertation in 1918 proposed a metric different from that of Riemann, and there has been considerable study of Finley spaces. Also Cartan has developed the geometry of metric spaces founded on the notion of area (Paris, 1933).

RIENZI, COLA DI (c. 1313–1354), tribune of the Roman people, was born in Rome, the son of a tavern-keeper named Lorenzo Gabrini. His father's Christian name was shortened to Rienzo, and his own, Nicholas, to Cola; hence the Cola di Rienzi, or Rienzo, by which he is generally known. His early years were passed at Anagni. The study of the Latin writers, historians, orators and poets filled his mind with stories of the glories and the power of ancient Rome, and he dreamed of restoring his native city to its pristine greatness. His zeal was quickened by the desire to avenge his brother, who had been killed by a noble. Rienzi became a notary and a person of some importance in the city, and was sent in 1343 on a public errand to Pope Clement VI. at Avignon. He won the favour and the esteem of the pope, who gave him an official position at his court. Returning to Rome about April 1344 he gathered a band of supporters, plans were drawn up, and at length all was ready for the rising. On May 19, 1347, heralds invited the people to a parliament on the Capitol, and on the 20th, Whit-Sunday, the meeting took place. Dressed in full armour and attended by the papal vicar, Cola headed a procession to the Capitol; here he addressed the assembled crowd on

"the servitude and redemption of Rome." A new series of laws were adopted by acclamation, and unlimited authority was given to the author of the revolution. The nobles left the city or went into hiding, and a few days later Rienzi took the title of tribune (*Nicholaus, severus et clemens, libertatis, pacis justicieque tribunus, et sacra Romane Republice liberator*).

The new ruler governed the city with a stern justice, in marked contrast to the recent reign of licence. The tribune moved through the streets of Rome in state, being received at St. Peter's with the hymn *Veni Creator spiritus*. Petrarch wrote to him, urging him to continue his great and noble work, and called him the new Camillus, Brutus and Romulus. In July in a sonorous decree he proclaimed the sovereignty of the Roman people over the empire, but before this he had set to work to restore the authority of Rome over the cities and provinces of Italy, to make the city again *caput mundi*. He invited the cities of Italy to send representatives to an assembly to meet on Aug. 1, when the formation of a great federation under the headship of Rome would be considered. On the appointed day representatives appeared, and after elaborate and fantastic ceremonial Rienzi, as dictator, issued an edict citing the emperor Charles IV., and also the imperial electors and all others concerned in the dispute, to appear before him in order that he might pronounce judgment in the case. On the following day the festival of the unity of Italy was celebrated.

Rienzi's power was recognized in Naples, whence both Queen Joanna and her bitter foe, King Louis of Hungary, appealed to him for protection. On Aug. 15 he was installed tribune with great pomp, wreaths of flowers being placed on his head. Gregorovius says this ceremony "was the fantastic caricature in which ended the imperium of Charles the Great. A world where political action was represented in such guise was ripe for overthrow, or could only be saved by a great mental reformation." Rienzi then seized, but soon released, Stephen Colonna and other barons who had spoken disparagingly of him. But his power was waning. His extravagant pretensions excited ridicule. His government was costly, and he was obliged to lay heavy taxes upon the people. He offended both pope and emperor by his proposal to set up a new Roman empire, resting directly upon the will of the people. In October Clement gave power to a legate to depose him and bring him to trial. The exiled barons gathered some troops, and war began. Rienzi obtained aid from Louis of Hungary and others, and on Nov. 30 his forces defeated the nobles in a battle outside the gates of Rome, where Rienzi's most distinguished foe, Stephen Colonna, was killed. But this victory did not save him. He passed his time in feasts and pageants, while in a bull the pope denounced him as a criminal, a pagan and a heretic, until, terrified by a slight disturbance on Dec. 15, he abdicated and fled from Rome. He sought refuge in Naples, but soon left that city and spent over two years in a mountain monastery.

Emerging from his solitude Rienzi journeyed to Prague, which he reached in July 1350, and threw himself upon the protection of the emperor Charles IV. Denouncing the temporal power of the pope he implored the emperor to deliver Italy, and especially Rome, from their oppressors; but Charles kept him in prison for more than a year in the fortress of Raudnitz, and then handed him over to Clement. At Avignon, where he appeared in August 1352, Rienzi was tried by three cardinals, and was sentenced to death, but this judgment was not carried out, and he remained in prison. In December 1352 Clement died, and his successor, Innocent VI., anxious to strike a blow at the baronial rulers of Rome, pardoned and released his prisoner. Giving him the title of senator, he sent him to Italy with the legate, Cardinal Albornoz, and Rienzi, with a few mercenaries, entered Rome in August 1354. He was received with great rejoicing, and regained his former position. A tumult broke out on Oct. 8. Rienzi attempted to address the mob, but the building in which he stood was fired, and while trying to escape in disguise he was murdered. In 1887 a statue of the tribune was erected at the foot of the Capitoline hill in Rome.

Rienzi's life and fate have formed the subject of a famous novel by Bulwer Lytton, of an opera by Wagner and of a tragedy by Julius Mösen. His letters, edited by A. Gabrieli, are published in vol. vi. of *Die Fests per la storia d'Italia* (Rome, 1890). See also Papencordt,

Rodocanachi, *Cola di Rienzi* (Paris, 1888); Kühn, *Die Entwicklung der Bundespolitik Cola di Rienzo im Jahre 1347* (Berlin, 1903); A. von Reumont, *Geschichte der Stadt Rom* (1867-70); and F. Gregorovius, *Geschichte der Stadt Rom im Mittelalter*, vol. vi. (Eng. trans., by A. Hamilton, 1898).

RIESA, a German town, in Saxony, on the Elbe, 30 m. N.W. of Dresden, on the main line of railway to Leipzig, and at the junction of lines to Chemnitz, Elsterwerda and Nossen. Pop. (1939) 29,873. Riesa received municipal rights in 1632, and after a period of decay was again raised to the rank of a town in 1859. The town contains a castle, which is now used as a town hall. There are rolling-mills and saw-mills and ironworks. Other industries are the manufacture of furniture, beer, soap, carriages, marble wares, and bricks. The most important shipping station on the Elbe in Saxony, Riesa is the landing-place for goods to and from Bavaria, and a mart for herrings, petroleum, wood and grain. A passenger steamboat service is maintained with Meissen and Dresden.

RIESENER, JEAN HENRI (1734-1806), French cabinet-maker of the Louis XVI. period, was born at Gladbach near Cologne on July 4, 1734, and died in Paris on Jan. 6, 1806. At an early age he went to Paris, where he entered the workshop in the arsenal of Jean François Oeben. When his master died, Riesenener became foreman of the works; two years later he married Mme. Oeben. By 1782 he had accumulated a fortune of about £40,000 and had received the title, formerly Oeben's, of "Ébéniste du Roi." Riesenener was unquestionably the greatest of the Louis Seize cabinet-makers. His work is generally bold and graceful. His marquetry presents an extraordinary finish; his chiselled bronzes are of the first excellence. He was especially distinguished for his cabinets, in which he employed many European as well as exotic woods. Wreaths and bunches of flowers form the centres of the panels; on the sides are often diaper patterns in quiet colours. His high-water mark was reached in the Bureau du Roi, conceived by Oeben, finished in 1769 and consequently belonging rather to the Louis Quinze than the Louis Seize period, and a similar cylinder bureau believed to have been made for Stanislas Leszczyński, king of Poland, now in the Wallace Collection. At Buckingham Palace there is a third bureau on the same lines. These pieces are triumphs of marquetry. For long Riesenener followed Oeben, but there was a gradual transition to a style more individual, more delicately conceived, with finer but hardly less vigorous lines. By the time he had been working alone for ten years he had completely embraced the Louis Seize manner—he had, perhaps, some responsibility for it. One of the most distinguished of his achievements for the court was the famous flat writing-table now at the Petit Trianon. Some of his creations are vitiated by being mounted with panels of Sèvres, Wedgwood and other china. Such is the beautiful little secrétaire in the Jones collection in the Victoria and Albert Museum.

See P. de Salvette, *Les Ébénistes du XVIII. Siècle* (Paris, 1927).

RIESENGBIRGE or **GIANT MOUNTAINS**, a lofty and rugged group on the boundary between Prussian Silesia and Bohemia, between the upper courses of the Elbe and the Oder. They are continued towards the north-west in the Erzgebirge, the Thuringian Forest and the Harz Mountains. Adjoining the Isergebirge and the Lausitzergebirge on the west, and the Eulengebirge and the Adlberggebirge on the east and south-east, the Riesengebirge proper trend south-east and north-west between the sources of the Zacken and the Bóber, for a distance of 23 m., with a breadth of 14 miles. They cover an area of about 425 sq.m., three-quarters of which is in Czechoslovakia, the rest in Germany. The boundary line follows the crest of the principal ridge (Riesenkamm, average height 4,000 ft.), which stretches along the northern side of the group. The principal peaks are the Reiftriff (4,430 ft.), the Hóbes Rát (4,950 ft.), the Great Sturmhaube (4,862 ft.), the Little Sturmhaube (4,646 ft.), and near the east extremity, the Schneekoppe (5,253 ft.), the loftiest mountain in northern or central Germany. Roughly parallel to this northern ridge, and separated from it by a long narrow valley of the Siebengründe, there extends on the south a lower chain, of broad massive "saddles," with comparatively few peaks. The chief

heights here are Kesselkoppe (4,708 ft.), the Krkonose (4,849 ft.), the Ziegenrücken and the Brunnenberg (5,072 ft.). From both ridges spurs are sent off, whence a magnificent view is obtained from Breslau to Prague; the lowlands of Silesia, watered by the Oder, and those of Bohemia, intersected by the Elbe and Moldau, appear to lie mapped in relief near the Schneekoppe. A group of isolated columnar rocks known as the *Adersbacher Felsen* occur in a valley on the Bohemian side of the Riesengebirge, 9 m. from Braunau.

On its northern side this mountain group has a rugged and precipitous slope from the Hirschberg valley; but on its southern slope, towards Bohemia, a more gradual one. The Bohemian ridge is cleft about the middle by a deep gorge through which pour the headwaters of the river Elbe, which finds its source in the Siebengründe. A great number of small streams also rise among these mountains and small lakes and tarns are not unfrequent. The Great and Little Schneegruben—two deep rocky gorge-like valleys in which snow remains all the year round—lie to the north of the Hohes Rad.

A wide range of rock formations occurs in the Riesengebirge. Archaean gneisses and schists form an important part, but Palaeozoic and Mesozoic rocks (especially Jurassic and Cretaceous) are also important. Variscan and Tertiary folding affected the region and north-easterly faults run along the foot of the Iserberg and Riesengebirge. Extensive peat moors occupy many of the mountain slopes and valleys. The lower parts of the mountains are clad with forests of oak, beech, pine and fir; above 1,600 ft. only the last two kinds of trees are found, and beyond about 3,950 ft. only the dwarf pine (*Pinus Pumilio*). Various alpine plants are found, some of them having been artificially introduced on the Schneekoppe. Wheat is grown to an elevation of 1,800 ft. above the sea and oats as high as 2,700 feet.

The Riesengebirge is easily accessible by railway, several branches from the main lines on both sides, penetrating the valleys, and thus many spots are a good deal frequented in the summer. The Schneekoppe and other summits are annually visited by numbers of travellers, notably the spas of Warmbrunn (near Hirschberg) and Flinsberg on the Gneis, and Görbersdorf, with its sanatorium. The Riesengebirge is the legendary home of Number Nip (*Rühzähl*), a goblin of German folklore.

RIETI (anc. *Riezze*), a city and episcopal see of Italy, the capital of the province of Rieti, 25½ mi. by rail and 15 mi. direct S.S.E. of Terni, which is 70 mi. by rail from Rome. Population (1936) 14,366 (town), 34,769 (commune). It is 1,318 ft. above sea level on the right bank of the Velino (a torrent tributary to the Tiber), which at this point issues from the limestone plateau; the old town occupies the declivity and the new town spreads out on the level. While with its quaint red-roofed houses, its old town walls (some Roman fragments, restored about 1250), its cathedral (13th and 15th centuries), its episcopal palace (1283), and its various churches and convents Rieti has much mediaeval picturesque; it also displays a good deal of modern activity in corn, vine and olive growing and cattle-breeding. The fertility of the neighbourhood is celebrated both by Virgil and by Cicero.

In 1149 the town was besieged and captured by Roger I. of Sicily. In the struggle between church and empire, it always held with the former; and it defied the forces of Frederick II. and Otto IV. Pope Nicholas IV. long resided at Rieti, and it was there he crowned Charles II. of Anjou king of the Two Sicilies. In the 14th century Robert, and afterwards Joanna of Naples managed to keep possession of Rieti for many years, but it returned to the States of the Church under Gregory IX.

About the year 1500, the liberties of the town, long defended against the encroachments of the popes, were entirely abolished. An earthquake in 1785 was in 1799 followed by the pillage of Rieti by the Neapolitans.

See G. Colasanti, *Rieti* (Perugia, 1911).

RIEVAULX (rè-è-vè), a village, North Riding, Yorkshire, England, three miles west by north of Helmsley, which is served by the L.N.E. railway. Pop. (1931) 208. It is situated on the River Rye before it emerges from the York moors into the Vale

of Pickering. The name is probably a corruption of Rye Vale. Rievaulx abbey, one of the most beautiful ruins in Yorkshire, was founded by the Cistercians in 1131. The principal remains are those of a cruciform church which is mainly Early English in style and is of very fine workmanship. Considerable fragments of the refectory remain and the domestic buildings may be traced.

RIF CAMPAIGNS: see MOROCCO: *History, 19th Century.*

RIFIS, the name given to the Berbers of the Rif district of Morocco, the mountain region bordering the north coast from Ceuta eastward nearly to the borders of Algeria and forming part of the Atlas range. The Rif dialect changes the Arabic "l" to "r," and this supports the derivation of "Rif" from "Libi," "b" and "f" being interchangeable. See MOROCCO.

RIFLE: see SMALL ARMS, THE DEVELOPMENT OF.

RIFLE-BIRD or **RIFLEMAN-BIRD**, the name applied to birds of paradise (*q.v.*) of the genera *Ptilorhynchus* and *Craspidornis*, probably because their plumage bears some resemblances to the full-dress uniform (green and black) of the British rifle regiments. There are five species, of which one inhabits New Guinea and the others the Australian continent. The best known is *P. paradisæa*. See K. B. Sharpe, *Monograph of the Paradisidae*.

RIGA, a seaport of Latvia, of which it is the capital, in 57° 3' N., 24° 1' E. Pop. (1939) 393,211. It is situated at the southern extremity of the Gulf of Riga, 8 mi. above the mouth of the western Dvina, which is connected by means of inland canals with the basins of the Dnieper and Volga. The Gulf of Riga is 100 mi. long and 60 mi. wide, with shallow waters of slight salinity and a greatest depth of 22 fathoms. It is frozen for an average of 127 days in the year. The sea entrance has a depth of 24½ ft. which is dredged constantly to 26 ft. The channel up to the town is 26 ft. deep, and the depth at the quays varies from 18 to 26 ft. There are vast warehouses and a large grain elevator. The port has eight state-owned electric cranes of 2½ tons as well as seven private ones of larger capacity, including two electric revolving cranes (25 and 10 tons) and floating cranes of 130-, 15- and 5-ton capacity. The Riga Exchange committee's slip dock at Bolderaja is capable of taking ships up to 1,000 tons. Large ships unload at Ut-Dvinsk (formerly Dinamünde). The imports ordinarily are herrings, foodstuffs, clothing, sugar, tobacco, industrial and agricultural machinery, mechanical tools, railway equipment, coal, coke and fertilizers, and the exports flax, timber, wooden goods, dairy produce and meat (pork and ham). The town manufactures paper, wood pulp, cellulose, matches, veneered goods, paints and varnishes, textiles (especially cotton and linen goods), boots and shoes, rubber goods, cement, vegetable oils, tobacco and alcoholic drinks. Manufactures were seriously hampered by the destruction of factories and plants during World War I; Riga was occupied by German troops in September 1917 and held to the end of the war.

Riga consists of four parts—the old town and suburbs on the right bank of the Dvina (Latvian, *Daugava*), and the Mitau suburb on the left bank, the two sides being connected by a floating bridge, which is removed in winter, and by a viaduct, 820 ft. long. The old town still preserves its Hanseatic features—high storehouses, with spacious granaries and cellars, flanking the narrow, winding streets. The only open spaces are the market-place and two other squares. The suburbs, with their broad and quiet boulevards on the site of the fortifications, grew steadily during the period of Latvian independence, 1918-1939.

Few antiquities of the mediaeval town remain. The oldest church, the Dom (St. Mary's), founded in 1215, was burned in 1547, and the present building dates from the second half of the 16th century, but has been thoroughly restored since 1883. Its organ, dating from 1833, is one of the largest in the world. St. Peter's church, with a beautiful tower 412 ft. high, was erected in 1406-9. The castle was built in 1494-1515 by the master of the Knights of the Sword, Walter von Plettenberg, a spacious building often rebuilt. The "House of the Black Heads," a corporation, or club, of foreign merchants, was founded in 1330, and subsequently became the meeting-place of the wealthier youth.

The Livländische Ritterhaus, the former place of meeting of the Livonian nobility, still stands. Near the city are extensive

summer bathing beaches, with little wooden chalets. When Dorpat (Tartu) university, which served all the Russian Baltic provinces, became Estonian property in 1919, Riga Polytechnic institute was made a university. In 1939 7,231 students were enrolled.

History.—Riga was founded in 1158, as a storehouse at the mouth of the river, by a few Bremen merchants. About 1190 the Augustinian monk Meinhard created a monastery there, and in 1199–1201 Bishop Albert I of Livonia obtained from Pope Innocent III permission for German merchants to land at the new settlement, and chose it for his seat, exercising his power over the neighbouring district in co-operation with the Teutonic Knights. As early as the first half of the 13th century the city obtained the right of electing its own magistracy. It joined the Hanseatic League, and from 1253 refused to recognize the rights of the bishop and the knights. In 1420 it fell under the rule of the bishop, who maintained his authority until 1566, when it was abolished in consequence of the Reformation. Sigismund II, king of Poland, took Riga in 1547, and in 1558 the Russians burned its suburbs. In 1561 Gotthard Kettler abdicated his mastership of the order of the Teutonic Knights, and Riga, with southern Livonia, became a Polish possession. After some unsuccessful attempts to reintroduce Roman Catholicism, Stephen Bathory, king of Poland, recognized the religious freedom of the Protestant population. In 1621 Gustavus Adolphus, king of Sweden, took it from Poland, and the Swedes held it when the Poles and Russians besieged it in 1656. During the Northern War between Sweden and Russia, it was defended (1700), but after the battle of Poltava it was taken in July 1710 by the Russians. In 1919 it became the capital of the independent republic of Latvia. During World War II the town was occupied by the Russians, then by the Germans.

RIGAUD, HYACINTHE (1659–1743), French painter, born at Perpignan on July 20, 1659, was the descendant of a line of artists. He was sent to Montpellier to study under Pezet, and afterwards went to Lyons, and in 1681 to Paris. There he obtained the grand prix de Rome, but on the advice of Jean Le Brun he allowed it to lapse and devoted himself to painting portraits. For 62 years he did as many as 30 to 40 portraits a year. But Rigaud, although purely a portrait painter, set his heart on gaining admission to the academy as a historical painter, and succeeded in Jan. 1700. He died on Dec. 27, 1743.

His principal portraits at the Louvre are those of himself and his mother (Marie Serre), of the sculptor Desjardins, of Mignard and Le Brun, of Bossuet and of Louis XIV.

RIGBY, RICHARD (1722–1788), English politician, was the only son of Richard Rigby (d. 1730) of Mistley Hall, Essex, a merchant who made a fortune through his connection with the South Sea company. Young Rigby became an associate of Frederick, prince of Wales, and entered parliament in 1745. He is chiefly known to fame through his connection with John Russell, 4th duke of Bedford, and the "Bloomers gang," his audacity earning for him the title of the "brazen boatswain" of the "crew." In 1758 he became secretary to Bedford, who was lord lieutenant of Ireland, and in 1759 he was given the office of master of the rolls for Ireland. Following the political fortunes of the duke he became vice-treasurer of Ireland in 1765, and in 1768 he obtained the position of paymaster-general of the forces. Rigby often spoke in parliament, and in 1769 he shared in the opposition to Wilkes. In 1784 he resigned his position as paymaster-general, and was surprised and embarrassed when requested to pay over the sum of public money which was in his possession. He left a fortune when he died at Bath on April 8, 1788. Wrexall says that Rigby "possessed talents for addressing a popular assembly which were sustained by a confidence that nothing could abash."

RIGEL, the bright star at the heel of the constellation Orion (α₁). It is of magnitude 0.34, being one of the brightest stars in the sky. Its equivalent in the alphabetical series is β Orionis. Rigel is in reality—as well as apparently—one of the brightest stars known. It is a blue supergiant located at a probable distance from the sun of about 1,100 light-years. If Rigel were as close to the sun as the bright star Sirius (nine light-years), it would shine with a brilliancy similar to that of the half-moon. (See STAR.) (W. W. M.)

RIGG, JAMES HARRISON (1821–1909), English Non-conformist divine, was born at Newcastle-on-Tyne on Jan. 16, 1821. In 1845 he entered the Wesleyan ministry, and during the agitation of 1849–52 wrote successfully in exposition and defence of the polity of Methodism. In 1857 he published *Modern Anglican Theology*, an acute criticism of the writings of Coleridge, Hare, Maurice, Kingsley and Jowett. In 1868 Rigg was appointed Principal of the Westminster Wesleyan Training College for day-school teachers, a post which he held for 35 years. In 1870 he was elected on the first School Board for London. In 1886 he sat on the Royal Commission of Education. In 1878 he was elected president of conference—and again in 1892. He resigned his principalship in 1903 and died at Brixton on April 17, 1909.

See *Life* by John Telford (1909). His other works include: *National Education in its Social Conditions and Aspects* (1873); *The Living Wesley* (1875, reissued as *The Centennial Life of Wesley in 1891*); *Character and Life-work of Dr. Pusey* (1893); *Oxford High Anglicanism and its chief Leaders* (1895).

RIGGING (A.S. *urigan* or *urhan*, to clothe), the general term, in connection with ships, for the whole apparatus of masts, yards, sails and cordage. (See also SHIP; YACHT; SEAMANSHIP.) The word is also used as meaning the cordage only.

SAILING SHIPS

Sailing vessels of all classes are classed according to their "rig," i.e., the particular combination of spars, sails and cordage. "Cutter," "brig" or "ship," are really convenient abbreviations for "cutter-rigged," "brig-rigged," or "ship-rigged."

The basis of all rigging is the mast whether it be composed of one or of many pieces of wood or of steel. The mast is supported against fore and aft or athwartship strains by fore and back stays and by shrouds, known as the "standing rigging," because they are made fast, and not hauled upon. In the case of a mast composed of several parts, including topmast and topgallant masts, the stays, and other ropes which keep the top and topgallant masts in place, are however only comparative fixtures as they may be cast off when these masts are lowered down. The bowsprit, though it does not rise from the deck but projects from the bow, is in the nature of a mast. The masts and bowsprit support all the sails, whether they hang from yards, slung across the mast, or from gaffs, projecting from the mast, or, as in the case of the jibs, or other triangular sails, travelling on the ropes called "stays," which go from the mast to the bowsprit or deck. The bowsprit is subdivided like the masts. The bowsprit proper corresponds to the lower fore-, main- or mizzen-mast. The jib-boom, which is movable and projects beyond the bowsprit, corresponds to a topmast; the flying jib-boom, which also is movable and projects beyond the jib-boom, answers to a topgallant mast. The ropes by which the yards, booms and sails are manipulated for trimming to the wind or for making or shortening sail, are known as the "running rigging." The rigging also provides the crew with the means of going aloft, and for laying out on the yards to let fall or to furl the sail. Therefore the shrouds (see below) are utilized to form ladders, the steps of which are called ratlines. Near the heads of the lower masts are the tops—platforms on which men can stand—and in the same place on the topmasts are the "cross-trees," of which the main function is to extend the topgallant shrouds. The yards are provided with ropes, extending from the middle to the extremities or yard-arms, called foot-ropes, which hang down about 2 or 3 ft., and on which men can stand. The material of which the cordage is made differs greatly. Leather has been used but the prevailing materials have been hemp or grass rope, and, in recent days, chain and wire. As the whole of the rigging is divided into standing and running, so a rope forming part of the rigging is divided into the "standing part" and the "fall." The standing part is that which is made fast to the mast, deck or block. The fall is the loose end or part on which the crew haul. The block is the pulley through which the rope runs. A "tackle" (pronounced "taltel") is a combination of ropes and blocks which gives increased power at the lifting or moving end, as distinct from the end which is being "manned." If fig. 1 is followed from the bow to the mizzenmast, it will be seen that a succession

THE SPARS, SAILS AND RIGGING OF A FULL-RIGGED SHIP

1. Flying jib; 2. Outer jib; 3. Inner jib; 4. Jib; 5. Fore staysail; 6. Fore royal; 7. Fore topgallant sail; 8. Fore upper topsail; 9. Fore lower topsail; 10. Fore fore; 11. Main royal staysail; 12. Main topgallant staysail; 13. Main topmast staysail; 14. Main upper topsail; 15. Main lower topsail; 16. Main topgallant sail; 17. Main upper topsail; 18. Main lower topsail; 19. Mainmast; 20. Mizzen staysail; 21. Mizzen royal; 22. Mizzen topgallant sail; 23. Mizzen upper topsail; 24. Mizzen lower topsail; 25. Crossjack; 26. Spanker

of stays connect the masts with the hull of the ship or with one another. All pull together to resist pressure from in front. Pressure from behind is met by the backstays, which connect the topmasts and topgallant masts with the sides of the vessel. Lateral pressure is met by the shrouds and breast-backstays. A temporary or "preventer" backstay is used when great pressure is to be met. The bobstays hold down the bowsprit, which is liable to be lifted by the tug of the jibs and of the stays connecting it with the fore-topmast. If the bowsprit is lifted the fore-topmast loses part of its support.

The running rigging by which all spars are hoisted or lowered and sails spread or taken in may be divided into those which lift and lower—the lifts, jeers, halliards (halyards)—and those which hold down the lower corners of the sails—the tacks and sheets. A long technical treatise would be required to name the many parts of standing and running rigging and their uses. All that is attempted here is to give the main lines and general principles or divisions.

The vessel dealt with here is the fully rigged ship with three masts. But the principles of others are the same. The simplest of all forms of rigging is the dipping lug, a quadrangular sail hanging from a yard and always hoisted on the side of the mast opposite to that on which the wind is blowing (the lee side). When the boat is to be tacked so as to bring the wind on the other side, the sail is lowered and rehoisted. One rope can serve as halyard to hoist the sail and as a stay when it is made fast on the weather side on which the wind is blowing. The difference between such a craft and the fully rigged ship is that between a simple organism and a very complex one; but it is one of degree, not of kind. The steps in the scale are innumerable. Every sea has its own type. (See Pl. II, figs. 1, 2, 3, 4, 5, 6, 7.) Some in eastern waters are of extreme antiquity, and even in Europe vessels are still to be met with which differ very little if at all from ships of the Norsemen of the 9th and 10th centuries. For a full account of these varieties of rigging the reader may be referred to *Mast and Sail in Europe and Asia* (London, 1906), by H. Warington Smyth.

When the finer degrees of variation are neglected the types of

rigging may be reduced to comparatively few, which can be classed by the shape of their sail and the number of their masts. At the bottom of the scale is such a craft as the Norse herring boat. This boat has one quadrangular sail suspended from a yard which is hung (or slung) by the middle to a single mast which is placed (or stepped) in the middle of the boat. She is the direct representative of the ships of the Norsemen. Her one sail is a "course" such as is still used on the fore and mainmasts of a fully developed ship; a topsail may be added (above the course) and then we have the beginning of a fully clothed mast. A very similar craft called a Humber keel is used in the north of England. The lug sail is an advance on the course, since it is better adapted for sailing on the wind, with the wind on the side. When the lug is not meant to be lowered, and rehoisted on the lee side, as in the dipping lug mentioned above, it is slung at a third from the end of the yard, and is called a standing lug. A good example of the lug is the junk (Pl. II, figs. 4, 6). The lug is a "lifting sail," and does not tend to press the vessel down as the fore and aft sail does. Therefore it is much used by fishing vessels in the North Sea. The type of the fore and aft rig is the schooner (Pl. I, fig. 9). The sails on the masts have a gaff above and a boom below. These spars have a prong called "the jaws," which fit to the mast, and are held in place by a "jaw rope" on which are threaded beads called trucks. Sails of this shape are carried by fully rigged ships on the mizzenmast, and can be spread on the fore and main. They are then called tryssails and are used only in bad weather when little sail can be carried, and are hoisted on the tryssail mast, a small mast above the great one. The lateen sail (Pl. II, fig. 2) is a triangular sail akin to the lug, and is the prevailing type of the Mediterranean. These original types, even when unmodified by mixture with any other, permit of large variations. The number of masts of a lugger may vary from one to five, and of a schooner from two to five or even seven. A small lug may be carried above the large one, and a gaff topsail added to the sails of a schooner. A one-masted fore-and-aft-rigged vessel may be a cutter (Pl. I, fig. 1) or sloop. But the pure types may be combined, in topsail schooners, brigantines, barquentines and barques, when the topsail, a

VARIOUS TYPES OF SAILING VESSELS AND THEIR RIGGING

1. A cutter, with gaff mainsail and topsail
2. A yawl, with Bermuda or jib-headed rig
3. A staysail schooner, so-called because of the staysails between the masts instead of the regular foremast
4. A brigantine, or hermaphrodite brig
5. A three-masted schooner, fore-and-aft-rigged on all three masts
6. A barquentine, fore-and-aft-rigged on fore and main masts and fore and aft
7. A brig; two-masted ship, square-rigged on both masts
8. A barquentine; three-masted ship, square-rigged on foremast only
9. A three-masted schooner, fore-and-aft-rigged on all three masts
10. A Great Lakes schooner, with a ruffe or triangular sail on the foremast

8. Dutch fishing boat as used on the Zuider Zee
9. English fishing smacks

quadrangular sail hanging from and fastened to a yard, slung by the middle, is combined with fore and aft sails. The lateen rig has been combined with the square rig to make such a rigging as the xebec—a three-masted vessel square rigged on the main, and lateen on the fore and mizzen. Triangular sails of the same type as the jibs can be set on the stays between the masts of a fully rigged ship, and are then known as staysails. But it can only be repeated that the variations are innumerable. Studding-sails (pronounced "stun-sails") are lateral extensions to the courses, topsails, etc., of a square-rigged ship to increase the spread of sails, that require the support of special yards, booms and tackle.

The development of the rigging of ships is a very obscure subject. It was the work of centuries, and of practical men who wrote no treatises. It has never been universal. A comparison of the four-masted junk given above with the figures of ships on mediaeval seals shows at least much similarity. Yet by selecting a few leading types of successive periods it is possible to follow the growth of the fully rigged ship, at least in its main lines, in modern times.

For a time, and after the use of spritsails had been given up, the spritsail yard continued to be used to discharge the function now given to the gaffs. (See Smyth, *Sailor's Word-Book*.) The changes in the mizzen have an obscure history. About the middle of the 18th century it ceased to be a pure lateen. The yard was retained, but no sail was set on the fore part of the yard. Then the yard was given up and replaced by a gaff. The resulting new sail was called the spanker. It was, however, comparatively narrow, and when a greater spread of sail was required, a studding-sail (at first called a "driver") was added, with a boom at its foot. At a later date "spanker" and "driver" were used as synonymous terms, and the studding-sail was called a "fringtall." The studding-sails are the representatives of a class of sails once more widely used. In a certain time a sail is cut of the extreme size which is capable of being carried in the weather, and when the wind freshens the part which is not needed is lowered up to the mast by a rope known as the "come-arned" to the sail. Till the 17th century at least the practice was often to cut the courses so that they could be reefed in rough weather. When a greater spread of sail was required, a piece called a booby was added to the fore course, and the further part called a double-booby could be added to that. It is a variety of the triangular construction of the sail, but this practice is not followed by the Swedish small craft called "lodjor" in the Baltic and White Sea. It will be easily understood that no innovation was universally accepted at once. Jib and sprit topsail, lateen-mizzen and spanker, and so forth, would be found for long on the sea together.

The history of the development of rigging is one of adjustment. The size of the masts had to be adapted to the ship, and it was necessary to find the due proportion between yards and masts. As the size of the mediaeval ship increased, the natural course was to increase the height of the mast and of the sail it carried. Even when the mast was subdivided into lower, top and topgallant, the lower mast was too long, and the strain of the sail racked the hull. Hence the constant tendency of the ships to leak. Sir Henry Manwaring, when giving the proper proportions of the masts, says that the Flemings (*i.e.*, the Dutch) make them taller than the English, which again forced them to make the sails less wide.

A few words may be added concerning the tops. In the earlier form of ships the top was a species of crow's nest placed at the head of the mast to hold a look-out, or in military operations to give a place of advantage to archers and slingers. They appear occasionally as mere bays attached to one side of the mast. As a general rule they are round. In the 16th century there were frequently two tops on the fore- and main-masts, one at the head of the lower, another at the head of the topmast, where in later times there have only been the two traverse beams which make the crossrees. The upper top dropped out by the 17th century. The form was round, and so continued to be till the 18th century when the quadrangular form was introduced.

Rigging in Power Ships.—The steam and motor ship still carries one or more masts for supporting derricks, for lifting

heavy weights in and out of the ship, for carrying wireless aerials for providing a platform for look out aloft, for mounting the steaming lights and for visual signalling. In the bigger ships the masts are usually hollow steel structures, occasionally with an internal ladderway, while in some merchant ships they also act as uptake ventilators. Stays are usually provided on the same principle as in sailing days, but dead eyes have given way to bottle screws as rope has to wire. Where masts are provided with ladderways, either internally or externally on the iron structure itself, ratlines on the rigging are dispensed with. Modern battleships, battle cruisers and light cruisers in the British navy usually have a tripod foremast in which the lower mast is supported by two inclined steel struts instead of rigging. This is to give the necessary rigidity for mounting the gun director, (*see* GUNNERY, NAVAL) control top and rangefinder.

The main mast usually carries the main derrick and is stayed on the old lines. Wooden topmasts and sometimes topgallant masts are fitted for wireless and signalling, while one or more signal yards are always carried on the foremast. In light cruisers the main mast is usually a small wooden pole. Destroyers and other light craft are fitted with a light wooden foremast and usually a short main or mizzen mast.

The upper end of the standing rigging is shackled to steel bands round the lower masthead and their lower ends are secured to the deck by bottle screws and slips, the screw being locked by a check piece which prevents it easing back, and together with its slip it is covered with painted canvas.

The topmast rigging, consisting of the usual shrouds, stays and back stays is fitted with insulators so as to avoid interference with wireless and danger from lightning. In the case of ships with a tripod foremast it is set up to projections on a level with the base of the control top instead of being brought right down to deck level. A Jacob's ladder gives access to the masthead, whilst above all is a lightning conductor connected by a copper strap running down the mast to the hull of the ship. Where a masthead flashing lamp is fitted, a gallows is provided for its reception. In flagships a pole 16 feet long is clamped to the foremast or fore topgallant mast head to carry the Admiral's flag.

Modern Running Rigging.—The only semblance to running rigging in a modern power ship is as follows:

Gantlines, which can be rove through a sheave in the topmast for tricing weights aloft and general purposes.

Clothes lines and hammock gantlines, used for drying clothes or hammocks, which in warships are of thin flexible steel rope which lead through blocks on a shroud near the fore or main lower mast heads and are set up well forward or well aft.

Dressing lines, leading from the foremast awning stanchion over both topmasts and down to the after awning stanchion. To these are attached flags for "dressing ship."

Signal halyards, made of light white line led through blocks on the yards and trucks for hoisting signal flags.

RIGHT, AUGUSTO (1850-1920), Italian physicist, was born at Bologna on Aug. 27, 1850. He studied at Bologna, where he afterwards held several posts for the teaching of physics. In 1880 he was appointed professor of physics at Palermo university and in 1889 to a similar post at Bologna, which he retained until he died, on June 8, 1920.

Right's researches were on electricity, magnetism and light. He discovered the variation in the resistance of bismuth in a magnetic field, and applied this to the measurement of magnetic fields. Right extended Kerr's observations on the Kerr effect, and found the variation in the rotation of the plane of polarization with the wave length of the light. He examined the phenomena in

a discharge tube and investigated the potential in the neighbourhood of the cathode. Right observed the discharge of negative electricity from a zinc plate when illuminated by ultraviolet light, and this led him to work on photoelectricity. He worked with electromagnetic waves and designed a Hertzian oscillator known by his name. His principal works are: *Ricerche di elettrostatica* (1872), *La telegrafia senza filo* (with B. Dessau, 1902, etc.), *L'ottica delle oscillazioni elettriche* (1897), *La moderna teoria dei fenomeni fisici* (1907), *Le nuove vedute sulla struttura della materia* (1907), *I fenomeni elettro-atomici sotto l'azione del magnetismo* (1918).

RIGHT ASCENSION, in astronomy, the co-ordinate of a heavenly body defined by the angle which the meridian passing through it makes with the prime meridian through the vernal equinox (see ASTRONOMY).

RIGHT-HANDEDNESS: see HANDEDNESS.
RIGHTS OF MAN AND OF THE CITIZEN, DECLARATION OF, a sort of manifesto issued in 1789, by the constituent assembly in the French Revolution, to be inscribed at the head of the constitution when it should be completed. It stated the fundamental principles which inspired the revolution. The declaration was first drafted and proposed by the marquis de Lafayette, who had returned from America full of enthusiasm for the principles proclaimed in the Declaration of Independence. The final text voted by the assembly and accepted by the king on Oct. 5, 1789, is much fuller than the American prototype. It contains a preamble and 17 articles. They proclaim and define political equality and liberty in its various manifestations.

See E. Blum, *La Déclaration des droits de l'homme et du citoyen*, text with commentary (1903); G. Jellinek, *Die Erklärung der Menschen und Bürgerrechte* (Leipzig, 1895). This study was translated into English by Rudolf Tombo, and aroused considerable controversy.

RIGHT WHALE (*Eubalaena*) is found in the northern and southern hemispheres. The allied Greenland whale (*Balaena mysticetus*), also called the bowhead whale, attains a length of 60 ft. to 70 ft., the largest and most valuable of the whalebone whales, a single specimen sometimes furnishing 3,500 lb. of whalebone. It was formerly the mainstay of the whaling trade, but now almost extinct. (See CETACEA; WHALE FISHERIES.)

RIGORD (c. 1150-c. 1209), French chronicler, was probably born near Alais in Languedoc, and became a physician. He entered the monastery of Argenteuil, and then that of St. Denis, and described himself as *regis Francorum chronographus*. Rigord wrote the *Gesta Philippo Augusti*, covering the period 1179-1206. It was abridged and continued by William the Breton.

See Dom Bouquet's *Recueil des historiens des Gaules et de la France* (Paris, 1738-1876); another ed. by H. F. Delaborde (Paris, 1888-89); French trans. in tome xi of François Guizot's *Collection des mémoires relatifs à l'histoire de France jusqu'à XIII^e siècle* (Paris, 1825).

RIGORISM, a philosophical term applied by Immanuel Kant specially to those moralists who take up an anthropologist or ascetic standpoint (Lat. *rigor*, stiffness, firmness). In general the term is opposed to "latitudinarianism" or "indifferentism"—respectively a morality of compromise and a morality of pure indifference—and signifies insistence upon the strictest interpretation of a principle, rule or criterion. Thus, in Roman Catholic theology, a rigorist holds that in cases of conscience the proper course is to adhere to the strict wording of the law in question.

RILA (Bulg. *RIJSKOE SELO*), a village of Bulgaria, 51 mi. S.W. of Sofia, which can be reached by rail to Radomir and Devaulpe. Pop. 3,490. Ten miles farther, up a gorge of the Rila mountains, stands the monastery of Rila, the largest and richest in Bulgaria. It was founded in the 10th century.

RILEY, JAMES WHITCOMB (1849-1916), U.S. poet, was born, of pioneer stock, in Greenfield, Ind., Oct. 7, 1849. "The poet of the common people," Riley was elected to the American Academy of Arts and Letters, received the gold medal of the National Institute of Arts and Letters, was given several honorary degrees and in 1915 had his birthday declared an official holiday throughout his home state in honour of "Indiana's most beloved citizen." After a happy boyhood, when he records in his poems, he found his father's profession of lawyer distasteful and spent several years as an itinerant sign painter, entertainer

and assistant to patent-medicine venders, all valuable experience, for it gave him the opportunity to compose songs and dramatic skits, to gain skill as an actor and to come into intimate touch with the rural folk of Indiana. His first reputation came through his poems contributed to newspapers—*Leontine*, which purported to be a poem written by Edgar Allen Poe, and the series in Hoosier dialect ostensibly written by a farmer, "Benj. F. Johnson, of Boone," which he contributed to the *Indianapolis Daily Journal* and later published in book form as *The Old Swimmer's Hole* and *Leven More Poems* (1883). Riley was for a short time local editor of the *Anderson (Ind.) Democrat*, but his later life was spent in Indianapolis, where he died, July 22, 1916.

Of Riley's numerous volumes, among the most outstanding are: *The Boss Girl and Other Sketches* (1885; republished 1891 as *Sketches in Prose*), *Pipes o' Pan* at Zekesbury (1888), *Old-Fashioned Roses* (1888), *The Flying Islands of the Night* (1891), *A Child-World* (1896), *Home Folks* (1900). Because of reprints under varying titles, it is most satisfactory to read him in one of the collected editions: *Poems and Prose Sketches* (Homestead ed., 16 vol., 1897-1914); the biographical edition prepared by his nephew and secretary E. H. Eitel (6 vol., 1913); and the memorial edition of his *Complete Works* (10 vol., 1916). Hewitt Howland collected Riley's conventional English verse in *The Lockerbie Book* (1911) and his dialect poems in *The Hoosier Book* (1916).

See Clara E. Laughlin, *Reminiscences of James Whitcomb Riley* (1906); also Marcus Dickert, *The Youth of James Whitcomb Riley* (1910) and *The Maturity of James Whitcomb Riley* (1921); and Edgar Lee Masters, "James Whitcomb Riley," *Century Mag.* (Oct. 1927).

RILKE, RAINER MARIA (1875-1926), was born in Prague, Dec. 4, 1875. He studied in St. Pölten, Prague, and in Munich and Berlin, travelled throughout Europe, and frequented artistic circles, acting in 1905-06 as Auguste Rodin's secretary. During World War I he served for a short time in the Austro-Hungarian war department. His work includes both prose and verse, and he became regarded as the foremost German lyric poet of the first half of the 20th century. Russian religious mysticism influenced his philosophical poetry. His poetical style is of a unique delicacy and grandeur. In the last seven years of his life he settled down in Muzot, Switz., and here he was able to bring his work to a fitting end: in Feb. 1922, he finished the 10 *Duinese Elegies* and the 55 *Sonnets to Orpheus*. He found, in the French language, from which he had previously translated, new fields of expression for original poems. He died at Valmont, Switz., Dec. 29, 1926. The first complete collection of his works appeared in 1929 in six vol.; famous single publications are: *Zwei Prager Geschichten* (1899); *Mit zur Feier* (1899); *Geschichten vom lieben Gott* (1900); *Wortspiele* (1903); *Auguste Rodin* (1903); *Das Stundenbuch* (1905); *Die Weise von Liebe und Tod des Cornets Christoph Rilke* (1906); *Neue Gedichte* (1907-08); *Requiem* (1909); *Aufzeichnungen des Malte Laurids Brigge* (1910); *Das Marienleben* (1913); *Erste Gedichte* (1913); *Sonette an Orpheus* (1923); *Duinese Elegien* (1923); *Verger*, poems in French (1925).

RIMBAUD, JEAN ARTHUR (1854-1891), French poet and adventurer, born at Charleville, in the Ardennes, on Oct. 20, 1854. He was the second son of a captain in the French army who in 1860 abandoned his wife and family. From early childhood Arthur Rimbaud, who was severely brought up by his mother, displayed rich intellectual gifts and a sullen, violent temperament. He began to write when he was ten, and some of

the poems which now appear in his works belong to his 15th year

Before he was 16, in consequence of a violent quarrel with his mother, the boy escaped from Charleville with a packet of his verse, was arrested as a vagabond, and for a fortnight was locked up in the Mazas prison, Paris. A few days after being taken home Rimbaud escaped again, into Belgium, where he lived for some time as a tramp, and then returned to his mother's house. In 1871 he was 17 years of age. In 1877 he left his mother for the third time and made his way to Paris, where he knew no one, and whence, after very nearly dying of hunger and exposure, he haggled his way back to Charleville. There he wrote in the same year the extraordinary poem of *Le Bateau ivre*, which is now hailed as the pioneer of the entire "symbolist" or "decadent" movement. In 1878 he came to Paris, where he met Verlaine. Verlaine, who encouraged the boy of 17 (whom he supposed to be a man of 30) to return to Paris. Rimbaud spent from October 1878 to July 1879 in the capital, partly with Verlaine, partly as the guest of Théodore de Banville, and served in the army of the Commune. With Verlaine he travelled for 13 months, and at the end of the journey, though Rimbaud was but 19, he was in 1881 he published the poem which he called *Un Saison en Enfer*, in prose; in this he gives an allegorical account of his extravagant relations with Verlaine, which ended at Brussels by a double attempt of the latter to murder his young companion. On the second occasion Rimbaud was dangerously wounded. In 1882 he returned to his mother, and the elder poet was immediately laid to rest for two years.

[illegible]

Meanwhile, in 1886, believing Rimbaud to be dead, Verlaine had published his poems under the title of *Les Illuminations*, and they had created a great sensation in Paris. In this collection appeared the sonnet on the vowels, attributing a different colour to each: "A noir, E blanc, I rouge, U vert, O bleu voyelles." But the author, in his Abyssinian hut of palm leaves, was, remained, quiescent. He was the face of the fact, the face of the thing, the face of the word. He had told Harrar and go to Europe for surgical advice. He reached Marseilles, but the case was hopeless; the leg had to be amputated, and Rimbaud died there in hospital on Nov. 10, 1891. The poems of Rimbaud all belong to his earliest youth. Their violent originality, the influence which they have exercised upon younger writers, the tumultuous existence of their author, and the strange veil of mystery which still hangs over his life, have fascinated and fascinated. His life was written by M. Paterné Berrichon (1897), and reminiscences by his sister, Mlle. Isabelle Rimbaud. His *Oeuvres* were collected in 1898 by MM. Berrichon and Delahaye, and in 1901 his statue was unveiled at Charleville. (E. G.)

RIME, a beautiful, white, friable, crystalline ice deposit formed by freezing of supercooled cloud- or fog-water droplets on objects exposed to the cloudy or foggy air. It occurs in two typical shapes: (1) growths of uniformly short, projecting, feathery-branching crystal aggregates on all sides of a freely exposed object, and (2) asymmetrical growths of crystal aggregates in the

form of long plates or flags orientated into the direction held by the wind during the formation of the deposit. The latter type, which may reach a length of 6 ft, is common on exposed upper slopes of mountains in middle and high latitudes; the terms "frozen fog deposit" and "frost feathers" are often applied to the phenomenon in such places. The first type is less common and occurs chiefly in valleys from winter ground fogs with calm air. Under the microscope, pine appears to be a specific approximation of minute crystals, which form a network of thin plates, while the other types consist of more or less rounded grains. We have previously pointed out that the low-lying clouds over the sea near the coast of Norway do not differ in their composition from those over land. This is confirmed by the fact that the same processes take place in the atmosphere over both land and water.

(R. G. SE.)

RIME ROYAL, the name given to a strophe or stanza form, which is of Italian extraction, but is almost exclusively identified with English poetry from the 14th to the early 17th century. It appears to be formed out of the stanza called *ottava rima* (*q.v.*), by the omission of the fifth line, which reduces it to seven lines of three rhymes, arranged *ababbc*. It was earliest employed with skill, if not invented, by Chaucer, who composed his long romantic poem of *Troilus and Cressida* in rime royal, of which the following is an example:

"And as the new-abashed nightingale,
Thet stineth first when she beginneth sing,
When that she heareth any herdë tale,
Or in the hedges any wight stirring,
And, after, siker doth her voice out-riſe,—
Right so Cresseyda, when her dreded stint,
Opened her heart, and told all her intent."

In the 15th century this stanza was habitually used, in preference to heroic verse, by Thomas Occleve and John Lydgate, and with more melody and grace, by the unknown writer of *The Flower and the Leaf*. In the 16th century it was regarded as the almost exclusive classical form for poetry in English. It was especially popular, as it is captured in Scotland, where *The King's Quair* of King James I., the *Fables of Henryson* and *The Thistle and the Rose* of Dunbar had taken closely followed the pattern of Chaucer. After the first decade of the 16th century, the time of the flowering of the stanza, it was occasionally followed, but not in poems of great length or particular importance. Rime royal should always be written in fanning metre, and formed of seven lines of equal length, each containing ten syllables.

RIMINI, a town and bishop's see of Italy (anc. *Ariminum*, g.v.), in the province of Forlì, Emilia, on the Adriatic coast, 60 mi. S.E. of Bologna by rail. Pop. (1956): town, 3,505; commune, 64,738. The city is bounded on three sides by the sea. It faces the Adriatic to the north, has the torrent Apruna, now called Auser, on the east, and the river Marecchia, which has been canalized to serve as a harbour for small boats, on the west. It stands in a fertile plain, which on the southern side soon swells into pleasant slopes backed by the jagged peaks of the Umbrian Apennines. The foremost foothill of the range is the steep crag of Monte Titano, crowned by the towers of the republic of San Marino. Rimini attracts numerous visitors for the sea-bathing, and has extended as far as the coast, from which the old town is nearly a mile distant. Apart from its ancient buildings, Rimini has some interesting churches, notably S. Agostino in the Romanesque style (1247) with a lofty campanile; the Palazzo del Podestà (1304) and dell'Aréngo (1204) are good mediaeval buildings; there is a municipal picture gallery and an archaeological museum. The ancient castle of Sigismondo Malatesta is now dilapidated. For the church of S. Francis see below.

HISTORY

Rimini is the ancient Ariminum (*q.v.* for its early history and remains). Alternately captured by Byzantines and Goths, it was rigorously besieged by the latter in A.D. 538. They were, however, compelled to retreat before the reinforcements sent by Belisarius and Narses; thus the Byzantines, after various vicissitudes, became masters of the town, appointed a duke as its governor, and included it in the exarchate of Ravenna. It afterward fell into the power of the Lombards, and then of the Franks, who yielded

it to the pope, for whom it was governed by counts to the end of the 10th century. Soon after this period the imperial power became dominant in Rimini. In 1157 Frederick I. gave it, by imperial patent, the privilege of coining money and the right of self-government; and in the 13th century we find Rimini an independent commune waging war on the neighbouring cities.

Rise of the Malatesta.—In the year 1216 Rimini, being worsted by Cesena, granted citizenship to two members of the powerful Malatesta family, Giovanni and Malatesta, for the sake of their aid and that of their vassals in the defence of the state and the conduct of the war. This family quickly struck root in the town; and in 1237 Giovanni was named podestà.

Giovanni Malatesta died in 1247 and was succeeded by his son Malatesta, born in 1212 and surnamed Malatesta da Verrucchio. This chieftain, who lived to be 100 years old, was the real founder of his house. Being repeatedly elected podestà for lengthy terms of office, he at last became the virtual master of Rimini. Pope Boniface VIII. not only left Malatesta, as a Guelph champion, unmolested but in 1299 conferred on him fresh honours and estates, so that his power went on increasing to the day of his death in 1312. He had four sons, Malatestino, Giovanni (called the Lame), Paolo, and Pandolfo. Giovanni served under Giovanni da Polenta of Ravenna and won the hand of that potentate's beautiful daughter, known to history as Francesca da Rimini. But her heart had been won by the handsome Paolo, her brother-in-law; and the two lovers, being surprised by Giovanni, were murdered by him (1285). This episode has been immortalized in Dante's *Inferno*. Giovanni died in 1304. Thus in 1312 Malatestino became lord of Rimini, and on his decease in 1317 bequeathed the power to his brother Pandolfo.

Pandolfo died in 1336, leaving two heirs, Malatesta and Galeotto. In 1355 the Malatesta were reduced to submission by Pope Innocent VI. The two brothers divided their lands. Galeotto retained the lordship of Rimini, ruling tranquilly and on good terms with the popes, who allowed him to add Cervia, Cesena, and Bertinoro to his states. Dying in 1385 at the age of 80, he left two sons—Carlo (1364-1420) and Pandolfo (1370-1427). Carlo left no sons. Of those of Pandolfo, the eldest, Galeotto (1411-32), was an ascetic, gave little or no attention to public business, and, dying early, bequeathed the state to his brother Sigismondo Pandolfo. The third son, Novello (1418-65) ruled over Cesena.

Sigismondo Pandolfo.—Sigismondo (1417-68) is the personage to whom Rimini owes its renown during the Renaissance, of which indeed he was one of the strangest and most original representatives. He was born in Brescia, and when called to the succession, at the age of 15, had already given proofs of valour in the field. His knowledge of antiquity was so profound as to excite the admiration of all the learned men with whom he discoursed, even when, as in the case of Pius II., they chanced to be his personal enemies. To him is due the erection of the church of St. Francis, or temple of the Malatesta, the greatest of Rimini's treasures. On assuming power in 1432, Sigismondo was already affianced to the daughter of Count Carmagnola; but when that famous leader was arraigned as a traitor by the Venetians, and ignominiously put to death, he promptly withdrew from his engagement and espoused Ginevra d'Este, daughter of the duke of Ferrara in 1434. In 1440 his wife died. Two years afterwards he married Polissena, daughter of the famous condottiere, Francesco Sforza, who in 1443 bore him a son named Galeotto Roberto. But by this time he was already madly in love with Isotta degli Atti, and this was the passion which endured to his death. The lady succeeded in gaining an absolute ascendancy over him, which increased with time. She bore him several children, but this did not prevent his having others by different concubines. Such being the nature of the man, it is not astonishing that, as his ardour for Isotta increased, he should have little scruple in ridding himself of his second wife. On June 1, 1450, Polissena died by strangling, and on the 30th of the same month Isotta's offspring were legitimated by Nicholas V.

The Church of St. Francis.—Her marriage with Malatesta did not take place until 1450; but of the ardent affection that had long bound them together there are stronger proofs than the

lover's juvenile verses, or than even the children Isotta had borne to him. For, more than all else, the temple of St. Francis has served to transmit to posterity the history of their loves. Malatesta decided to build this remarkable church as a thank-offering for his safety during a dangerous campaign undertaken for Pope Eugene IV. about the year 1445. The first stone was laid in 1446, and the work was carried on with such alacrity that mass was performed in it by the close of 1450. Sigismondo entrusted the execution of his plans to Leon Battista Alberti. The vault was never finished, and still shows its rough beams and rafters. The eight side chapels alone are complete, and their pointed arches spring from Renaissance pilasters planted on black marble elephants, the Malatesta emblem, or on baskets of fruit held by children. Everywhere—on the balustrades closing the chapels, round the base of the pilasters, along the walls, beneath the cornice of both the exterior and the interior of the church—there is one ornament that is perpetually repeated, the interwoven initials of Sigismondo and Isotta. This monogram is alternated with the portrait and arms of Malatesta; and these designs are enwreathed by festoons linked together by the tyrant's second emblem, the rose. The most singular and characteristic feature of this edifice is the almost total absence of every sacred emblem. Rather than to St. Francis and the God of the Christians it was dedicated to the glorification of an unhallowed attachment. Nature, science, and antiquity were summoned to celebrate the tyrant's love for Isotta.

Sigismondo understood the science of fortification. He was also the first to discard the use of wooden bomb-shells and substitute others cast in bronze. As a soldier his numerous campaigns had shown him to be possessed of all the best qualities and worst defects of the free captains of his time. He took part in many hazardous campaigns against adversaries such as the duke of Urbino, Sforza of Milan, Piccinino, and, worst of all, the Sienese pope, Pius II., his declared and mortal foe. This time Sigismondo had blundered, and he was driven to make his submission to the pope, but, again rebelling, was summoned to trial in Rome (1460) before a tribunal of hostile cardinals. All the old charges against him were now revived and eagerly confirmed. He was pronounced guilty of rapine, incendiarism, incest, assassination, and heresy. Consequently he was sentenced to the deprivation of his state (which was probably the main object of the trial), and to be burnt alive as a heretic. This sentence, however, could not easily be executed, and Sigismondo was only burnt in effigy. He could afford to laugh at this farce; nevertheless he prepared in great haste for a desperate defence (1462). He knew that the bishop Vitelleschi, together with the duke of Urbino, and his own brother, Novello Malatesta, lord of Cesena, were advancing against him in force; and, being defeated at Pian di Marotta, he was forced to go to Rome in 1463, again to make submission to the pope. This time he was stripped of all his possessions excepting the city of Rimini and a neighbouring castle, but the sentence of excommunication was withdrawn. In 1464 he took service with the Venetians, and had the command of an expedition to the Morea. In 1466 he was able to return to Rimini, for Pius II. was dead, and the new pope, Paul II., was less hostile to him. Indeed, the latter offered to give him Spoleto and Foligno, taking Rimini in exchange; but Malatesta was so enraged by the proposal that he went to Rome with a dagger concealed on his person, to kill the pope. But, being forewarned, Paul received him with great ceremony and surrounded by cardinals prepared for defence; whereupon Sigismondo changed his mind, fell on his knees, and implored forgiveness. His star had now set forever. For sheer subsistence he had to hire his sword to the pope and quell petty rebellions with a handful of men. At last, his health failing, he returned to his family, and died in Rimini on Oct. 7, 1468, aged 51 years.

Roberto Malatesta.—He was succeeded by his wife Isotta and his son Sallustio, who were ousted by an illegitimate elder son (named Roberto Malatesta) by another mother. Isotta and Sallustio both died in 1470 in suspicious circumstances. Roberto died in 1482; his son Pandolfo died before Cesare Borgia in 1500. Rimini was captured by Pope Julius II after his victory at Ravenna in 1512. Malatesta made more than one attempt to

win back his city, but always in vain, for his subjects preferred papal rule; and in 1528 Pope Clement VII became definite master of the town. The history of Rimini practically ends with its independence.

RIMSKY-KORSAKOV, NICOLAS ANDREIEVICH (1844-1908), Russian composer, was born at Tikhvina, Novgorod, on March 18, 1844. He spent six years (1856-62) in the Naval college at St. Petersburg, and at the end of that time received a commission and spent three years afloat. But as a cadet he had been one of the musical amateurs who, with Borodin, Cui and Moussorgsky, gathered round Balakirev in St. Petersburg in the days when Wagner was still unknown. During his cruise he had written a symphony (in E minor) which in that year was performed—the first by a Russian composer—under Balakirev's direction, and in 1873 he definitely retired from the navy, having been appointed a professor in the St. Petersburg Conservatoire. The same year witnessed his marriage to a talented pianist, Nadejda Pourgold, and the production of his first opera, *Pshevtianka*. This was followed by *May Night* (1878), *The Snow Maiden* (1880), *Mlada* (1892), *Christmas Eve* (1894), *Sadko* (1895), *Mozart and Salieri* (1898), *The Tsar's Bride* (1899), *Tsar Saltan* (1900), *Servilia* (1902), *Koshchei the Immortal* (1902), *The Tale of the Invisible City of Kitezh* (1905), and *Le Coq d'Or* (1910). For all of these, with the exception of *Mozart and Salieri*, he chose Russian national subjects. But his operas attracted less attention abroad than his symphonic compositions, which show a mastery of orchestral effect combined with a fine utilization of Russian folk-melody. Notable among these works are his first symphony, his second (op. 9) *Antar*, his third (op. 32), and his orchestral suites including the well known *Scherzade* and overtures. He also wrote a number of beautiful songs, piano-forte pieces, etc., and he eventually took Balakirev's place as the leading conductor in St. Petersburg, where he died on June 20, 1908.

The influence of Rimsky-Korsakov on the Russian composers of his day was very great. His instrumentation was fresh and original; he was direct and clear, with something of a painter's vision, and he brought a wealth of learning and study to bear on his subject. Many came directly under his influence as his pupils at the Conservatoire, while many more studied his great treatise of *The Foundations of Instrumentation*. He did much also to promote the better appreciation of Moussorgsky and others of his fellow Russians, although during recent years he has been severely criticized for his alleged tampering with Moussorgsky's original text in his edition of *Boris Godunov*.

See his own *History of My Musical Life* (which has been translated into English); Stasov, *Rimsky-Korsakov* (1890); Rosa Newman, *The Russian Opera* (1914); Montagu Nathan, *History of Russian Music* (1915); G. E. Abraham, *Studies in Russian Music* (1936).

RINCEAU, from the French, meaning foliage. In architecture and the decorative arts, a decorative form consisting of a continuous wavy stemlike motif from which smaller leafy stems or groups of leaves branch out at more or less regular intervals. Its use is frequent in the friezes of Roman buildings, in the jamb ornament and capitals of Romanesque structures and in friezes and panels of buildings in the various Renaissance styles.

RINDERPEST. A disease, primarily of cattle, which has been known also as steppe murrain, contagious bovine typhus, peste bovine and cattle plague, rinderpest was first recognized in early Christian times. The earliest records of the disease suggest that it originated in Asia or eastern Europe, its incursions into western Europe having followed the paths of invading armies in the periodic sweeps of barbarous tribes from the east. Rinderpest reached Africa in the latter half of the 19th century and, after spreading throughout that continent with disastrous effect, was eventually cleared from the southern half but remained endemic

or enzootic in the northern parts, its southernmost extension being in Tanganyika territory. The disease is also endemic in India and certain parts of southeastern Asia. In all these areas rinderpest is considered a major obstacle to development of the livestock industry, and in unmechanized sections, particularly those in which the water buffalo is used as the principal beast of burden, agriculture in general is retarded.

Characteristics.—Rinderpest is an acute, highly contagious disease of ruminants characterized by an unusually rapid course and a high mortality in areas where the disease is not endemic. The causative agent is an ultraviral virus, provisionally named *Tortor bovis*.

When infection is introduced into a herd of susceptible animals, signs of illness appear after an incubation period of three to five days. Early signs are depression, loss of appetite and a staring coat. These are accompanied by a pyrexia generally of the order of 105° to 107° F. In the midcourse of the disease, ocular and nasal discharges and salivation with buccal ulceration and a disagreeable fetid odour are characteristic. Profuse diarrhoea with progressive emaciation and dehydration occur, often with dysentery and eventually marked tenesmus.

In many cases, a cutaneous, eruptive condition termed streptothricosis develops on the back and flanks. In the terminal stages of fatal cases, prostration, coma and death supervene generally after 10 to 14 days.

Autopsy of such an animal shows involvement of the mucous membrane of the entire alimentary tract. This is usually most marked in the mouth, where ulcers containing cheesy deposits are often found, and in the abomasum, ileum, cecum, colon and rectum, where deep congestion and sometimes ulceration occur. In the lower bowel the congestion is often in well-defined, dark streaks and has been referred to as zebra marking. Pneumonia frequently is seen as a complication, and often cystitis and vaginitis are present. Diagnosis is made on the clinical appearance of the disease and autopsy findings, but, since these may be similar to those found in certain other diseases, virus transmission and cross-immunity tests are necessary for confirmation.

Spread of the Disease.—The virus is generalized in the animal body and is passed out in all the secretions. It gains access to the tissues of a susceptible animal via the mucous membranes, most probably those of the nostrils. In areas where the disease is endemic, wild animals play an important part in the epidemiology. Many species of wild ruminants, together with wild pigs and warthogs in such areas as Tanganyika and Uganda, have been found to be susceptible to rinderpest. These animals, in competition with domestic animals for limited grazing and water, present great difficulties in the way of control. It is seen, therefore, that control of the disease is complicated by the maintenance of the virus in wild animals which form vast reservoirs of infection. Eradication in areas where wild animals exist in large numbers is dependent on the control of the disease in these animals or the elimination of their contact with the domestic animal populations.

Control.—Control of rinderpest has been attempted by several methods. Strict quarantine measures alone can be effective, provided the control of susceptible wild animals can be assured. However, it was early recognized that some form of immunization combined with quarantine was the most promising method of control, and efforts were made to find effective immunogens. As recovery from an attack of the disease leaves a durable immunity, early workers experimented with serum of recovered animals. Later, the bile of infected animals was tried. The former produced only a transient or passive immunity, while the latter caused a manifestation of the disease, often mild, which left an active immunity. The "serum simultaneous" method which comprised the simultaneous inoculation of virulent virus and sufficient immune or hyperimmune serum to modify the reaction, proved the most satisfactory of the early methods of artificial immunization used. The use of this method, however, has some serious disadvantages, the major one being that an animal reacting to this treatment is virtually suffering from rinderpest and is a possible source of infection to other susceptible animals, and so the use of this method may set up new foci of infection. Later work gave rise

to the production of vaccines made from virulent tissues, principally spleens, in which the virus is inactivated by means of some chemical agent. These so-called inactivated vaccines produce a solid immunity which, however, lasts only for a matter of months; nevertheless, they were of great value in the control of rinderpest. Although still used in some regions under special circumstances at mid-20th century, they had been superseded by the use of living rinderpest virus which had been attenuated by repeated passage in a species other than the bovine. The first step in this direction was taken with the adaptation of bovine virus to goats, followed by the widespread use of the so-called caprized virus in India and east Africa. Other workers, by adaptation of the virus to the rabbit and to the developing chick embryo, opened the way to the possible use of new vaccines.

(J. A. R.; J. K. H. W.)

RING, a band of circular shape, made of any material and for various purposes, but, particularly, a circular band of gold, silver or other precious or decorative material used as an ornament, not only for the finger, but also for the ear (see EAR-RING), or even for the nose, as worn by certain races in India and Africa.

Egyptian Rings.—The earliest existing rings are those found in the tombs of ancient Egypt. The finest examples date from about the 18th to the 20th dynasty; they are of pure gold, simple in design, very heavy and massive, and have usually the name and titles of the owner deeply sunk in hieroglyphic characters on an oblong gold bezel. Rings worn in Egypt by the poorer classes were made of less costly materials, such as silver, bronze, glass or pottery covered with a siliceous glaze and coloured brilliant blue or green with various copper oxides. Some of these had hieroglyphic inscriptions impressed while the clay was moist. Other examples have been found made of ivory, amber and hard stones, such as carnelian. Another form of ring used in the 12th and subsequent dynasties of Egypt had a scarab in place of the bezel, and was mounted on a gold hoop which passed through the hole in the scarab and allowed it to revolve.

Cylinders.—In ancient Babylonia and Assyria the signet took the form of a cone seal or of a cylinder cut in crystal or other hard stone and perforated from end to end. A cord was passed through the cylinder, and it was worn on the wrist like a bracelet.

Within the limits necessarily imposed by its purpose the finger ring assumed a considerable variety of form, according to its date and place of origin.

In the Cretan and Mycenaean periods a characteristic form of ring had a broad flat bezel, not organically connected with the hoop, and having an incised design in the gold. The use of inset stones hardly occurs, but rings from Enkomi and Aegina of the late Mycenaean period have inset paste decorations.

The Phoenician type of ring was primarily intended to carry a scarab or scarabeoid, usually in a box setting on a swivel, called for by the fact that the flat base of the scarab would be wanted for sealing purposes, but in wear would be most conveniently turned inward. Strength being necessary, the hoop became massive. A similar arrangement of the signet-scarab is found attached to a twisted ring, which, from its shape, must have been meant to be suspended, and which is shown thus worn on some of the Cypriote terra cottas.

The Greek ring of an early period has a characteristic flattened bezel, for an intaglio design in the gold. An alternative form was a swivel ring for a scarab or scarabeoid.

Etruscan Rings.—The Etruscans used very largely the gold swivel ring mounted with a scarab, a form of signet probably introduced from Egypt. Some found in Etruscan tombs have real Egyptian scarabs with legible hieroglyphs; others, probably the work of Phoenician or native engravers, have rude copies of hieroglyphs, either quite or partially illegible. A third and more numerous class of Etruscan signet rings have scarabs, cut usually in sard or carnelian. One from Etruria, now in the British Museum, is formed by two minutely modelled lions whose bodies form the hoop, while their paws hold the bezel, a scarab engraved with an lion of heraldic character. An alternative type of Etruscan ring has an incised design on the gold bezel, or a flat stone set in the rigid bezel.

Roman Rings.—The Romans appear to have imitated the sim-

licity of Laodæmonia. Throughout the republic none but iron rings were worn by the bulk of the citizens and even these were forbidden to slaves. Ambassadors were the first who were privileged to wear gold rings, and then only while performing some public duty. Next senators, consuls, equites and all the chief officers of state received the *fas annuli aurei*. In the Augustan age many valuable collections of antique rings were made, and were frequently offered as gifts in the temples of Rome. One of the largest and most valuable of the *dactylothecae* was at the temple of Apollo Palatinus by Augustus' nephew Marcellus (Pliny, *H.N.* xxxvii, 5).

Different laws as to the wearing of rings were passed during the empire: Tiberius made a large property qualification necessary for the wearing of gold rings in the case of those who were not of free descent; Severus conceded the right to all Roman soldiers; and later still, all free citizens possessed the *fas annuli aurei*, silver rings being worn by freedmen and iron by slaves. Under Justinian even these restrictions passed away.

Early Christian Rings.—Most early Christian rings date from the 4th century onward. Generally of bronze or gold they are often engraved with acclamations and invocations and occasionally with the owner's bust or with Christian symbols.

Celtic Rings.—Large numbers of gold rings have been found in many parts of Europe in the tombs of early Celtic races. They are usually of pure gold, often penannular in form, that is, with a slight break in the hoop so as to form a spring. They are often of gold wire formed into a shape of rope, or else of a simple twisted in situ wire. Some of the quite plain penannular rings were used in the place of coined money.

Throughout the middle ages the signet ring was a thing of great importance in religious, legal, commercial and private matters.

Episcopal Rings.—The episcopal ring was solemnly conferred upon the newly made bishop together with his crozier, a special formula for this being inserted in the Pontifical. In the earliest references to rings worn by bishops, there is nothing to distinguish them from other signet rings. In A.D. 610 the first mention has been found of the episcopal ring as a well-understood symbol of dignity. It is clear that it was derived from the signet. It was only in the 12th century and onward that it was brought into mystical connection with the marriage ring. In the time of Innocent III (1194) the ring was ordered to be of pure gold mounted with a stone that was not engraved; but this rule appears not to have been strictly followed. It was the use of the ring upon the death of a bishop for his ring to be handed over to the royal treasurer but many rings with all the appearance of consecration rings have been discovered in the coffins of bishops. Among the collection of rings formed by the naturalist Edward Warton and now in the Kensington museum, is a fine gold episcopal ring decorated with niello, and inscribed with the name of Alsthan, bishop of Sherborne from 824 to 867. In many cases an antique gem was mounted in the bishop's ring, and often an inscription was added in the gold setting of the gem to give a Christian name to the person given. The monks of Durham, for example, made an intaglio of Jupiter Serapis into a portrait of St. Oswald by adding the legend CAPT S. OSWALD. In other cases the engraved gem appears to have been merely regarded as an ornament without meaning—as, for example, a magnificent gold ring found in the coffin of Seifrid, bishop of Chichester (1125-1157), in which is mounted a Gnostic intaglio.

Papal Rings.—The papal "Ring of the Fisherman" (*annulus piscatoris*) bears the device of St. Peter in a boat, drawing a net from the water. The first mention of it, as the well-understood personal signet ring of the pope, that has been found, occurs in a letter of Clement IV in 1265. After the middle of the 15th century it was no longer used as the private seal of the popes, but was always attached to briefs. After the death of a pope the ring is broken. A new ring with the space for the name left blank is taken into the conclave, and placed on the finger of the newly elected pontiff, who thereupon declares what name he will assume, and gives back the ring to be engraved. (See Waterton, *Archæologia*, 40, p. 138.)

The so-called papal rings, of which many exist, dating from the 15th to the 17th centuries, are very large thumb rings, usually of gilt bronze coarsely worked, and set with a foiled piece of glass or crystal. On the hoop is usually engraved the name and arms of the reigning pope, the bezel being without a device. They are sometimes described as rings of investiture and according to another hypothesis they were carried as credentials by envoys. Such cumbersome ornaments could not have been worn by the popes and cardinals themselves.

Other Varieties.—The giving of a ring to mark a betrothal was an old Roman custom. The ring was probably a mere piece, *Agnes*, that the contract would be fulfilled. In Pliny's time a conservative custom still required a plain ring of iron, but the gold ring was introduced in the course of the 2nd century. This use of the ring, which was thus of purely secular origin, received ecclesiastical sanction, and formulae of the benediction of the ring exist from the 12th century. The exact stages by which the wedding ring developed from the betrothal ring can no longer be traced. Gold marriage rings enriched with niello date from the 5th century though they may not have been used in the actual ceremony of marriage.

Posy rings, so called from the *posy* or rhyme engraved on them, were specially common in the same centuries. The name "posy ring" does not occur earlier than the 16th century. A posy ring inscribed with "Love me and leave me not" is mentioned by William Shakes-

poets (*Mer. of Ven.*, act v, sc. 1). The custom of inscribing rings with mottoes or words of good omen dates from a very early time. Greek and Roman rings exist with words such as $\chi\rho\iota\sigma\tau\acute{o}\varsigma$, $\kappa\alpha\iota\phi\epsilon$, $\kappa\alpha\alpha\tau\epsilon$, or $\nu\omicron\iota\sigma\iota\varsigma$ (*Claudius Aelianus*). In the middle ages many rings were inscribed with words of cabalistic power, such as *anem sapio*, or Caspar, Melchior and Balthasar, the supposed names of the Magi.

In the 12th century memorial rings with a name and date of death were frequently made of very elaborate form, enamelled in black and white; a not unusual design was two skeletons bent along the hoop, and holding a coffin which formed the bezel.

Cramp rings were much worn during the middle ages as a preservative against cramp. They derived their virtue from being blessed by the king; a special form of service was used for this, and a large number of rings were consecrated at one time, usually when the sovereign touched patients for the king's evil.

Decade rings were not uncommon, especially in the 15th century; these were so called from having ten knobs along the hoop of the ring, and were used, after the manner of rosaries, to say nine Aves and a Pater Noster.

In the 15th and 16th centuries signet rings engraved with a badge or trademark were much used by merchants and others; these were not only used to form seals, but the ring itself was often sent by a trusty bearer as the proof of the genuineness of a bill of demand. At the same time private gentlemen used massive rings wholly of gold with their initials cut on the bezel, and a graceful knot of flowers twining round the letters. Other fine gold rings of this period have coats of arms or crests with graceful lambrequins.

Poison rings with a hollow bezel were used in classical times; as, for example, that which Hannibal killed himself, and the poison ring of Demosthenes. Pliny records that, after Cæsar had stolen the gold of the treasure from under the throne of Capitoine Jupiter, the guardian of the shrine, to escape torture, "broke the gem of his ring in his mouth and died immediately." The mediaeval *anello della morte*, supposed to be a Venetian invention, was actually used as an easy method of murder. Among the elaborate ornaments of the bezel a hollow point made to work a spring was concealed; it communicated with a receptacle for poison in a cavity behind, in such a way that the murderer could give the fatal scratch while shaking hands with his enemy. This device was probably suggested by the poison fang of a snake.

In Mathematics.—In mathematics the term "ring" is used for an important type of algebraic system. By a ring R is meant a set of elements in which two compositions, called addition (+) and multiplication (\cdot), are defined in such a way that the following conditions obtain:

- A 1 $a+b$ is in the set R .
- A 2 $(a+b)+c=a+(b+c)$.
- A 3 $a+b=b+a$.
- A 4 There is an element O in R such that $a+O=a$ for all a in R .
- A 5 For each a in R there is an element $-a$, called the negative of a , such that $a+(-a)=O$.
- M 1 ab is in R .
- M 2 $(ab)c=a(bc)$.
- D 1 $a(b+c)=ab+ac$.
- D 2 $(b+c)a=ba+ca$.

The conditions A 1 to A 5 imply that R is a commutative group (see GROUP) relative to the addition operation. Conditions M 1 and M 2 imply that R is a system of the type called a semigroup relative to multiplication, and D 1 and D 2 are the distributive laws connecting the two operations of addition and multiplication.

The concept of a ring is used in advance developments in algebra and details of such work may be found in the treatises listed in the bibliography.

RINGWOOD, a market town in Hampshire, England, 103½ mi. W.S.W. of London by the Southern Region Railway route.

Pop. (1931) 5,952. It lies on the river Avon, which here divides into numerous branches. The church of SS. Peter and Paul, of the 13th century, was almost entirely reconstructed in 1854. An agricultural trade and the manufacture of agricultural implements are carried on.

RINGWORM or **TINEA TONSURANS**, a disease mainly affecting the scalp; it consists of bald patches, usually round, and half an inch up to several inches across, the surface showing the broken stumps of hairs and a fine whitish powdering of desquamated epidermic scales. The disease is caused by a group of fungi distinguished, among other features, by the size of the spores they form. In London and Paris *Microsporum audouinii* causes about three-quarters of all cases of ringworm. If one of the broken hairs is plucked out with forceps and pressed flat under a cover glass in a drop of dilute caustic potash, the microscope will show it to be occupied by long rows of minute oval spores, very uniform in size. Forms of ringworm are also met with in lower animals (e.g., cat and dog) but according to J. G. Hare and P. Tate there is little evidence that these infect children. (*Journ. Hygiene*, 1927, xxvii, 32.)

Modern treatment is by X-ray (see RADIOLOGY) and is very effective. Thallium acetate has also been recommended. (See also FAVUS.)

RIO BRANCO, one of five federal territories of Brazil provided for in the constitution of 1937 and created by decree law in Sept. 1943. Other territories established by this decree were Amapá, Guaporé, Ponta Porã and Iguaçu (the last two abolished in 1946).

Governed by federal interventors (as were all the states from 1937), the territories came under the direct administration of the government. Situated along Brazil's sparsely inhabited frontiers, the territories have been ostensibly created for purposes of national defense, selective colonization, and economic development. Rio Branco, formerly a part of northern Amazonas, is bounded northeast by British Guiana, southeast by the Anauá and Branco rivers, south (between the mouths of the Branco and Paduaú rivers) by the Rio Negro, southwest by the Rio Paduaú, and northwest and north by Venezuela. Its area is 97,438 sq. mi.; population (1950) 17,623. (R. W. R.D.; X.)

RIO CUARTO, a town of Argentina in the province of Córdoba, 140 mi. S. of the city of that name, and about 385 mi. N.W. of Buenos Aires. Pop. (1943) 48,233. It stands 1,440 ft. above sea level and about halfway across the great Argentine pampas, on the banks of a river of the same name which finds an outlet through the Carcarañal into the Paraná near Rosario. The town is built on the open plain and is surrounded with attractive suburbs.

It is the commercial centre of a large district and has a large and lucrative trade. Its geographical position gives it great strategic importance, and the government maintains there a large arsenal and a garrison of the regular army. Previous to the activities of General Ivanovsky in 1872 this region was overrun by the Ranqueles, a warlike tribe of Indians. The surrounding country belongs to the partially arid pampas region and is devoted to stock raising agriculture. Irrigation is employed in its immediate vicinity. There are some manufacturing industries in the town, although it is primarily an agricultural centre.

The San Martín and the Mitre railways pass through Rio Cuarto, giving railway communication with Buenos Aires, Rosario, Tucumán, Córdoba, San Luis, Mendoza and other cities.

RIO DE CONTAS or **VILLA DE CONTAS**, a town of Brazil, in the state of Bahia, 230 mi. S.W. from the city of Salvador (Bahia), on a headwater stream of the Rio de Contas, which rises on the eastern slope of the neighbouring Serra de Santo Onofre, and flows southeast and east to the Atlantic coast at Barra do Rio de Contas.

The population of the town in 1950 was 14,666; municipality 16,186. Stock raising was formerly an important industry there. The town was founded in 1715 by some "Paulistas" who discovered gold there in the sands of the river. It became a *vila* in 1724, but was soon afterward moved down the river five miles to its present site.

RIO DE JANEIRO, a maritime state of Brazil, bounded north by Minas Gerais, east by Espírito Santo and the Atlantic, south by the Atlantic and west by São Paulo. It is one of the smaller states of the republic: area 16,087 sq.mi.; pop. (1950) 2,326,201. The state is traversed longitudinally by the Serra do Mar, which divides it into a low, narrow, irregular coastal zone and a broad elevated river valley through which the Paraíba flows eastward to the Atlantic. The eastern part of this valley widens out into a great alluvial plain on which are some of the richest sugar estates of Brazil. The well-watered Paraíba valley is celebrated for its fertility, and is an important centre of coffee production. Stock raising developed slowly after the abolition of slavery (1888). Manufacturing was developed largely because of the water power supplied by mountain streams; manufactures are cotton, woollen, silk and jute fabrics, brick, tile and rough pottery, sugar, rum, vehicles, furniture, beer and fruit preserves. Railways include the Central do Brasil, Leopoldina, Melhoramentos and Rio do Ouro. The Central line runs from the city of Rio de Janeiro north-northwest across the Serra do Mar to the Paraíba valley, where it divides into two branches at the station of Barra do Piraí, one running west to São Paulo and the other east and north into Minas Gerais. Besides these there are a number of short railways called the Teresópolis, União Valenciana, Rio das Flores, Bananal and Vassourense lines. The total extension of these railways in the state in 1949 was 1,681 mi. Other than Niterói, the ports of the state are São João da Barra, Macaé or Imbetiba, Cabo Frio and Parati, visited only by the smaller coasting vessels.

The capital of the state is Niterói, pop. (1950) 174,535, on the east side of the Bay of Rio de Janeiro; other cities and towns, with populations of the *municípios* in which they are located, are: Campos (240,829); city 63,384 on the lower Paraíba in a rich sugar-producing region; Rio Bonito (25,528); Itaboraí (30,489); Barra Mansa (72,458) on the upper Paraíba; Resende (35,414), in a fertile district of the upper Paraíba; Petrópolis (109,531); city 61,843; Cantagalo (21,898), in a rich coffee district of the Serra do Mar; Parati (9,459), a small port on the west side of the Bay of Angra dos Reis; Valença (36,544); Vassouras (60,114); São Fidelis (44,154), a river port on the lower Paraíba having steamboat communication with Campos; Macaé (53,292), an old port on the eastern coast of the state at the mouth of the Macaé river whose original anchorage has been filled with silt, and that of Imbetiba, in the vicinity, with which it is connected by tramway, is used by vessels both for the town and the Macaé and Campos railway; Barra do Piraí (45,549), an important station and junction of the Central do Brasil railway on the north side of the Serra do Mar, with large manufacturing and commercial interests; Paraíba do Sul (22,439), in a fertile, low-settled district in the northeast part of the state; Maricá (19,255); Cabo Frio (17,169); and Nova Friburgo (48,682).

RIO DE JANEIRO (in full, **SÃO SEBASTIÃO DO RIO DE JANEIRO**, colloquially shortened to Rio), a city and port of Brazil, capital of the republic and seat of an archbishopric, on the western side of the Bay of Rio de Janeiro, or Guanabara, in lat. 22° 53' 42" S., long. 43° 13' 22" W. (the position of the observatory). The city occupies about 60 sq.mi. in the southeast angle of the Federal District, an independent district or commune with an area of 452 sq.mi., detached from the province of Rio de Janeiro in 1834. The city stands in great part on an alluvial plain formed by the filling in of the western shore of the bay, which extends inland from the shore line in a northwesterly direction between a detached group of mountains on the south known as the Serra da Carioca, and the imposing wooded heights of the Serra do Mar on the north. The spurs of the Carioca range project into this plain, in some places close up to the margin of the bay, forming picturesque valleys within the limits of the city. Some of the residential quarters follow these valleys up into the mountains and extend up their slopes and over the lower spurs, which, with the hills covered with buildings rising in the midst of the city, give the city a distinctive charm. At the entrance to the bay is the Sugar Loaf (Pão de Açúcar), a conical rock rising 1,200 ft. above the water level and forming the terminal point of a short range

between the city and the Atlantic coast. The culminating point of that part of the Carioca range which projects into and partly divides the city is the Corcovado (Hunchback), a sharp rocky peak, 2,100 ft. above the Botafogo inlet, on whose narrow summit towers the imposing statue of Christ the Redeemer, the construction of which was completed in 1931. The Corcovado, approachable either by road or inclined railway, provides a point of vantage from which the entire capital, the bay and its surrounding districts may be viewed. Considerably beyond the limits of the city on its southwest side, but within the Federal District, is the huge isolated flat-topped rock known as the Gávea, 2,575 ft. high, which received its name from its resemblance to the square sail used on certain Portuguese craft. The sky line of this range of mountains, as seen by the approaching traveller several miles outside the entrance to the bay, forms the rough outline of a reclining figure called "the sleeping giant."

The entrance to the bay, between the Sugar Loaf on the west and the Bico do Papagaio (Parrot's Beak) on the east, with the fortress of Santa Cruz on one side and the fort of São João on the other, is about a mile wide. Although the entrance is free from obstructions, dangerous swells are produced by a deeply submerged bar whenever storms come out of the south or southwest. Almost midway in the channel is the little island and fort of Lage, temporary site of the first Huguenot settlement in Rio de Janeiro. On the west is the semicircular bay of Botafogo, round which are grouped the residences of one of the wealthiest suburbs; on the east, the almost landlocked bay of Jurujuba. (See NITERÓI.)

The bay extends northward about 16 mi. from the entrance channel, opening to a maximum width of about 15 mi. near its head. The irregular shore line was modified by the construction of sea walls and the filling in of shallow bays. Close to the shore are the islands of Villegaignon (occupied by the national naval academy), Cobras (occupied by fortifications, naval storehouses, hospital and dry docks), Santa Bárbara and Enxadas.

The oldest part of the city, which includes the commercial section, lies between Castle and Santo Antonio hills on the south, and São Bento, Conceição and Livramento hills on the north, and extends inland to the Praça da República, though the defensive works in colonial times followed a line much nearer the bay. This section was extended southward along the bay shore during the 19th century and led to the development of a string of suburbs such as Catete and Botafogo, with that of Laranjeiras behind Catete in a pretty valley of the same name, Leme, Copacabana, Ipanema and Gávea, the last including Rio's famous botanical garden, which dates from the early 19th century. The major trend of later development was northward and westward, where are to be found the suburbs of Cidade Nova, São Cristóvão, Engenho Novo, Praia Formosa, Pedregulho, Vila Isabel, Tijuca, Rio Comprido, Caju and others, some of which are residential, while others are essentially industrial. The outlying poorer suburbs are reached by the Central do Brasil railway; those closer in are served by street railways and buses. The population of the Federal District, according to the census of 1950, was 2,413,152, and of the city 2,335,931.

Climate.—The climate of Rio de Janeiro is warm and humid, the average temperature for the year being about 74° F., with July, the coolest month, having an average temperature of 68.7°. The rainfall averages about 44 in. annually, with July and August being the least rainy months. Formerly the low-lying and poorly drained areas which are marginal to the bay, plus the lack of adequate sanitary facilities, created a serious health problem in Rio de Janeiro, which was, however, in no way connected with the climate. Yellow fever, the first recorded appearance of which was in Dec. 1849, was for many years almost a regular occurrence, and the mortality from it was exceedingly high. This and other dangerous diseases disappeared as epidemics as a result of improved sanitary conditions following the notable work begun by Oswaldo Cruz, under whose direction Rio de Janeiro was made one of the most healthful of tropical cities.

Streets and Parks.—Some of the most modern streets were laid out with Spanish-American regularity, but much the greater

part seems to have sprung into existence without any plan. Most of the streets of the old city are parallel and cross at right angles, but they are narrow and enclose blocks of unequal size. Each suburb is laid out independently, with straight streets where the ground permits, and crooked ones where the shore line or mountain contour compels. From the beginning of the 20th century, large sums were expended on new avenues, the widening and straightening of old streets and the improvement of the water front between the Passeio Público and the southern extremity of the Praia de Botafogo by the construction of a grand boulevard, partly on reclaimed land. One of these improvements consists of a central avenue (Avenida Rio Branco) cut across the old city from a point on the water front near the Passeio Público northward to the Saúde water front. More than a mile long from north to south, it is lined with fine private and public buildings. The military, naval and jockey clubs are situated there, and also the offices of some of the principal newspapers, besides fashionable shops, cafés and business places. The shore line boulevard, called the Avenida Beira Mar, is more than 4 mi. long, the wider parts being filled in with gardens. Toward the south, outside the Guanabara bay, the shore along the beaches of Leme, Copacabana and Ipanema was built into one of the most fashionable resorts of the continent.

The Mangue canal, originally designed as an entrance to a central market for the boats plying the bay, is used for drainage purposes. The canal is nearly 2 mi. long, enclosed with stone walls, crossed by a number of iron bridges and bordered by lines of royal palms. The most famous street of the old city is the Rua do Ouvidor, running westward from the market place to the church of São Francisco de Paula, and lined with retail shops, cafés and newspaper offices. It has long been a favourite promenade, and fills an important part in the social and political life of the city. The principal business section includes a number of short and narrow streets between the Rua Primeiro de Março, once called Rua Direita, which extends from the Praça 15 de Novembro northward to São Bento hill and the Avenida Rio Branco. The widest boulevard in the city is the Avenida Presidente Vargas, which begins at the Candelária church and, crossing the Avenida Rio Branco at right angles, extends toward the west for more than 2 mi. The streets and suburbs are served by lines of the Rio de Janeiro Tramway, Light and Power Co., Ltd., which also supplies electric power to the city from hydroelectric plants.

The public parks and gardens are numerous and include the Parque Azulem Furtado, the largest park in the central district; the botanical garden with its avenue of royal palms; the Passeio Público (dating from 1783), a small garden on the water front facing the harbour entrance; the Praça Tiradentes with its magnificent equestrian statue of Dom Pedro I; the Praça 15 de Novembro on the water front, facing the old city palace; the Quinta da Boa Vista in São Cristóvão; and many smaller parks and squares.

Water Supply.—The water supply is derived from three sources: the small streams flowing down the mountainsides which serve small localities; the old Carioca aqueduct, dating from colonial times; and the modern Rio do Ouro waterworks, which bring in an abundant supply from the Serra do Tinguá, 30 mi. N.W. of the city. An extensive system of sewers was constructed and a separate system of rain-water drains.

Buildings.—There remain many public edifices and dwellings of the colonial period, severely plain in appearance, with heavy stone walls and tile roofs. The old city palace facing upon Praça 15 de Novembro, once the residence of the fugitive Portuguese sovereign Dom João VI, is a good example. The 19th century brought no important modifications until near its close, when French and Italian styles began to appear, both in exterior decoration and in architectural design. The Praça do Commercio (merchants' exchange) and post office on Rua 1º de Março and the national printing office near the Largo da Carioca are notable examples. After that time architectural styles changed radically, and apartments, hotels, office buildings and public buildings of the most advanced modern design and construction were built. At the southern end of the Avenida Rio Branco is a group of elegant state edifices, the Municipal theatre, the Monroe palace and the

National library and Academy of Fine Arts. The buildings of the ministries of finance, education and war are also among the most beautiful in the city. There are more than 200 churches in the city, including the cathedral which was built in 1761. The most noteworthy church is that of Our Lady of Candelária, in the commercial district, with twin towers and graceful dome.

Education.—Prior to 1920 Brazil had no university system, the plans for such having crystallized into nothing more tangible than a great number of institutions of higher learning and separate faculties. When Brazil adopted the university system in 1920, the University of Brazil in Rio de Janeiro was created, in spirit at least, as a reflection of the movement toward centralization. But it was not until 1931 that the realization of this plan began to be manifested. By a presidential decree in that year the faculties of education, sciences and letters were created, and such pre-existing institutions as the schools of law, medicine, pharmacy, dentistry, mines and fine arts, the Polytechnic school, the National museum, the Geological and Mineralogical institute, the Oswaldo Cruz institute (medical research), the Astronomical observatory, the Institute of Chemistry, the Botanical garden, the Institute of Legal Medicine, the Central Meteorological institute and other centres of higher learning were made integral parts of the university. Considerable progress was made in the field of teacher training, which was climaxed in Rio de Janeiro by the creation in 1935 of the University of the Federal District—comprising the teachers' college, schools of letters, sciences, economics and law and an institute of arts. This institution closed for a few years but was reopened in 1951. The school system of Brazil, and that of the Federal District, is under the administration of the ministry of education and health, with the National Council of Education acting in an advisory capacity. Private schools may be either autonomous or subject to government regulations. In addition to its two universities, Rio de Janeiro has many other institutes of learning, including preparatory schools, vocational schools and schools for the deaf and blind.

Hospitals and Asylums.—The Federal District has a number of hospitals, asylums and benevolent institutions. Chief of these is the Misericórdia hospital, popularly known as the "Santa Casa," belonging to a religious brotherhood dating from 1591. Other public hospitals are a lepers' hospital in São Cristóvão, the military and naval hospitals, the São Sebastião hospital and the isolation and contagious diseases hospitals in Jurujuba. The government participated in a program of remodeling and improving existing institutions and of building such new ones as the Jesus, Miguel Couto and Getúlio Vargas hospitals. There are also a number of private hospitals maintained by church brotherhoods and charitable associations; among them are the Portuguese hospital in Rua de Santo Amaro and the Strangers' hospital in Botafogo. Most prominent among the asylums is the Hospício Nacional for the insane, which was erected in 1842-52.

Harbour, Communications and Commerce.—The port and harbour of Rio de Janeiro are the largest and most important in the republic. The entrance is open to vessels of the largest draught, and there is sufficient deepwater anchorage inside for the navies of the world. The lower anchorage, where the health officers visit vessels, is below Ilha Fiscal, and the upper or commercial anchorage is in the broad part of the bay above Ilha das Cobras, the national coasting vessels occupying the shallower waters near the Saúde and Gambôa districts. The customhouse occupies a considerable part of the shore line before the old city.

The newer port works consist of an improved water front for the Saúde, Gambôa and Sacco do Alferes districts, in which the shipping interests are centred, and a continuation of the sea wall across the shallow São Cristóvão bay to the Ponta do Caij, the large reclaimed area being filled in by the removal of some small hills. The commercial quays are built in deep water and permit mooring alongside the largest vessels. The total length of the commercial quays is about 3,800 yd. Railway and streetcar connections are provided, and both electric and hydraulic power are available. Special surtaxes are levied on imports to meet the interest and redemption charges on the loans raised for the execution of these important works.

Railway communication with the interior is maintained by the Central do Brasil and the Leopoldina lines, besides which there is a short passenger line to Corcovado mountain about 2½ mi. long, an electric line to Tijuca and a narrow-gauge line running out to the Rio do Ouro waterworks. There is communication with Petrópolis by a branch line of the Leopoldina system, and also by a steamer to the head of the bay and thence by rail up the *serra*.

Rio de Janeiro is the seaport for a large area of the richest, most productive and most thickly settled parts of Brazil, including the states of Rio de Janeiro and Minas Gerais and a small part of eastern São Paulo. Its exports include coffee, sugar, hides, cabinet woods, tobacco and cigars, tapicaca, gold, diamonds, iron ore, manganese and sundry small products.

The city is also a distributing centre in the coasting trade, and many imported products, such as jerked beef (*xarque*), hay, flour, wines, etc., appear among the coastwise exports, as well as domestic manufactures. The total exports for 1949 amounted to 746,487 metric tons; imports in the same year totalled 2,879,524 metric tons. Formerly Rio de Janeiro led all other ports in Brazil in the export of coffee, but the enormous increase in production in the state of São Paulo later gave Santos the lead.

Manufactures.—In spite of Rio's leading role as a commercial port, the city is not equally important as an industrial or manufacturing centre. Manufactures consist largely of consumers' goods for the domestic market, and include such items as flour (from imported wheat), biscuits, macaroni, chocolate, fruit conserves, refined sugar, confectioneries and other foodstuffs, beer, liquors, ice, mineral waters, cigars and cigarettes, soap, candles, perfumes, furniture, boots and shoes, hats, clothing, rope, matches, ink, printing type, glass, chemicals, tires, etc. In addition there are plants which manufacture finished products from processed imports, especially drugs and sundries. There are machine and repair shops, the most important of which are the shops of the Central do Brasil railway. One of the most important industrial enterprises in the city is that of the Rio de Janeiro Tramway, Light and Power Co., whose generating plants are located about 50 mi. from the city. Promotion of trade in the city is largely a function of the chamber of commerce of Rio de Janeiro and the Federation of Brazilian Chambers of Commerce.

Government.—The Federal District, including Rio de Janeiro, is governed by a prefect, who represents the national government, and a municipal council, which represents the people. The prefect is appointed by the president of the republic for a term of four years, and the appointment must be confirmed by the senate. There are seven *diretorias*, or boards, under the prefect, each one assigned to a special field of work, chief among which are education, public health and social welfare, public works and transportation, finance, police, archives and statistics, forestry, and game and fishing. The municipal council of *intendentes* is elected by direct suffrage for a term of two years and is composed of 50 members who meet in ordinary session twice a year. The Federal District is represented in congress by 3 senators elected for nine years and 17 deputies elected for three years, and is credited with the rights and privileges of citizenship. On the other hand, the city is a garrison town and under direct administration of the national executive, who controls its police force and exercises partial control over its streets, squares and water front. In the work of improving the city the national government assumes the expense of the commercial quays, the filling of the São Cristóvão bay, the opening of the Mangue canal and its embellishment, the opening of the Avenida Central, the extension of the sewage system and the addition of new sources to the water supply, while the city was responsible for the Avenida Beira Mar, the opening of a new avenue from the Largo da Lapa westward to Rua Frei Caneca, the removal of the Morro do Senado, the widening of some streets crossing the Avenida Central and the opening and straightening of other streets.

History.—The discovery of the Bay of Rio de Janeiro is attributed by many writers to André Gonçalves and Amerigo Vespucci, who entered its waters on Jan. 1, 1502. Another Portuguese navigator, Martim Afonso de Souza, visited it in 1531, but passed on to São Vicente, near Santos, where he established a colony.

The first settlement in the bay was made by an expedition of French Huguenots under the command of Nicolas Durand de Villegagnon, who established his colony on the small island that bears his name. In 1560 their fort was captured and destroyed by a Portuguese expedition from Bahia under Gov. Mem de Sá, and in 1565 another expedition under Estácio de Sá, cousin of the governor, founded a Portuguese settlement in another part of the bay. Two years later the French were decisively defeated by Mem de Sá, and the Portuguese settlement was named São Sebastião do Rio de Janeiro, in honour of King Sebastian of Portugal and in honour of the saint's day (St. Sebastian the Martyr) on which the decisive battle was fought. The French had named their colony La France Antarctique, and their island fort had been called Fort Coligny. In 1710 a French expedition of five vessels and about 1,000 men under Jean François Duclerc attempted to regain possession, but was defeated; its commander was captured and later assassinated. This led to a second French expedition, under René Duguay-Trouin, who entered the bay on Sept. 12, 1711, and captured the town on Sept. 22. Duguay-Trouin released Duclerc's imprisoned followers, exacted a heavy ransom and then withdrew.

The discovery of gold in Minas Gerais at the end of the 17th century greatly increased the importance of the town. It had been made the capital of the southern captaincies in 1680, and in 1762 it became the capital of all Brazil. In 1808 the fugitive Portuguese court, under the regent Dom João VI, took refuge in Rio de Janeiro and gave a new impulse to its growth. It was thrown open to foreign commerce, foreign mercantile houses were permitted to settle there, printing was introduced, industrial restrictions were removed and a college of medicine, a military academy and a public library were founded. Dom João VI returned to Portugal in 1821, and on Sept. 7, 1822, Brazil was declared independent with Dom Pedro I as its first emperor and Rio de Janeiro as its capital. In 1839 a steamship service along the coast was opened, but direct communication with Europe was delayed until 1850 and with the United States until 1865. These services added largely to the prosperity of the port. The first section of the Dom Pedro II railway was opened in 1858, and the second or mountain section in 1864, which brought the city into closer relations with the interior. In 1874 cable communication with Europe was opened, which was soon afterward extended southward to the river Plate republics.

On Nov. 15, 1889, a military revolt in the city under the leadership of Gen. Manuel Deodoro da Fonseca led to the declaration of a republic and the expulsion of the imperial family, which was accomplished without resistance or loss of life. Disorders followed, a naval revolt in 1897 causing the resignation of President Deodoro da Fonseca and another in 1893–94 causing a blockade of the port for about six months and the loss of many lives and much property from desultory bombardments. Between 1894 and 1930 there were trifling outbreaks on the part of agitators, but at no time was the security of the government in danger. In Sept. 1930 a long-impending revolution was precipitated by the turn of events surrounding the presidential elections of that year. On Oct. 4, 1930, a group of high-ranking army officers in Rio de Janeiro seized and jailed the president (Washington Luís) and set up a military junta, which, one month later, turned over the presidency to Getúlio Vargas. In 1945 Vargas was in turn overthrown by a military uprising. Under a new constitution adopted in 1945, Gen. Eurico Gaspar Dutra was elected president to serve for a period of five years (1946–50). Vargas was elected president again in 1950.

RIO DE ORO, a Spanish possession on the northwest coast of Africa, extending north from Cape Blanco to Cape Bojador. North of Cape Bojador are two zones, the southern, reaching to

Cape Juby, being a Spanish protectorate, and the northern, from Cape Juby to the Wad Draa being "occupied territory." The three divisions are known collectively as Spanish Sahara. The frontier on the south traverses the middle of Cape Blanco promontory, thence it goes east and north in an irregular and arbitrary line till it meets the southern frontier of Morocco. East and south Spanish territory is bounded by the French Sahara. The area of Rio de Oro is about 65,000 sq.mi., that of the whole of Spanish Sahara about 100,000 sq.mi., mainly desert. The population, made up of nomad Arabs or Arabized Berbers, does not exceed 100,000 and four-fifths of the people live in the two northern zones. Here, in the basin of the Saqiyet el Hamra, a river (300 mi. long) reaching the Atlantic midway between Capes Juby and Bojador, are fertile regions which might repay cultivation, including the oasis of Smara, where is a permanent native settlement and a Kasbah (stone fort). The Spanish headquarters are at Villa Cisneros, on the peninsula forming the Rio de Oro inlet. It has about 500 European inhabitants, and since 1925 has acquired some importance as an air station. The chief advantage Spain derives from possession of the country is its convenience to the Canary Islands fishermen.

The peninsula of Rio de Oro is 23 mi. long and $1\frac{1}{2}$ to 2 mi. broad and it is on an average about 20 ft. above sea level. The estuary between peninsula and mainland is 22 mi. long, 5 broad, navigable over two-thirds of its extent, with good anchorage.

History.—The estuary was taken by its Portuguese discoverers in the middle of the 15th century for a river, and, obtaining there a quantity of gold dust from the natives, they named it Rio d'Ouro (Gold river), Rio de Oro being the Spanish form. The activity of the Portuguese was before long transferred to the true auriferous regions of the Gulf of Guinea. Spain's interest in the Saharan coast dates from the 13th century, but was particularly directed to that part nearest the Canary Islands. The site of the fort of Santa Cruz de Mar Pequeña, established in 1476, though not identified, was north of Cape Bojador. The protection of the Canary Islanders engaged in the fisheries south of that point occasioned, however, the presence of Spanish warships in these waters, and small trading stations were formed at Rio de Oro, Cape Blanco and elsewhere. To preserve the interests thus acquired, Spain in Jan. 1885 took the territories on the coast between Capes Blanco and Bojador under her protection. The extension inland of Spanish influence was opposed by France, which claimed a protectorate over the Sahara. A convention of 1900 fixed the limits of Rio de Oro proper; by subsequent agreements with France (in 1904 and 1912) the Spanish zone was extended first from Cape Bojador to Cape Juby, and secondly from Cape Juby to the Wad Draa, the inland frontier being fixed at $8^{\circ} 40'$ west. The 1912 agreement settled a matter long in dispute by fixing the southern frontier of Morocco, which had claimed the Cape Juby district, at the Wad Draa. By that agreement Spain bound herself not to cede or alienate in any form her rights in her zone of influence. In 1916 a small Spanish force was stationed at Cape Juby. It was at Cape Juby that in 1878 a British trading post had been established by Donald Mackenzie; it was eventually made over to the Sultan of Morocco (1895). Spanish Sahara is under the control of the captain general of the Canaries and a sub-governor lives at Villa Cisneros. Over the interior the authority of Spain remained almost nominal.

See *Spanish Sahara* (1920), a British Foreign Office handbook with bibliography; also the *Revista* and the *Boletín* of the Madrid Royal Geog. Soc.

RIO GRANDE, or **RIO GRANDE DO SUL** (rarely São Pedro do Rio Grande do Sul); a city and port of the state of Rio Grande do Sul, on the western side of the Rio Grande (as the outlet of the Lagoa dos Patos is called), about 6 mi. from its mouth and nearly 780 mi. S.W. of Rio de Janeiro, in lat. $32^{\circ} 7' S.$, long. $52^{\circ} 8' W.$ Population (1950) of Rio Grande 64,241; including the *município*, 78,941. The principal streets are served by tramways, and the Rio Grande do Sul railway has an extension to its shipping wharf called "Estação Marítima" ($1\frac{1}{2}$ mi.), a branch to the old port on the north side of the city ($1\frac{1}{2}$ mi.), and a branch to Sequeira, near the sea coast (8 mi.). The city is a port of call

for several steamship lines, and has direct communication with European ports. Vessels of 28 ft. draught have entered the port, and those of 26 ft. draught may enter with safety.

The city is built on a low sandy peninsula, barely 5 ft. above sea level, formed by two arms of the Rio Grande projecting westward from the main channel, the peninsula being part of a large sandy plain extending southward along the coast to Lagoa Mirim. The level of the plain is broken by ranges of sand dunes, some of which rise not far from the city on the south and south-east. The openness of the surrounding country and the proximity of the sea give to Rio Grande unusually healthy conditions, which, however, are partially counteracted by defective sanitary arrangements. In pleasing contrast to the drifting sands which surround the city is the fertile Ilha dos Marinheiros (Sailors' island) lying to the northwest of the city; it is highly cultivated and supplies the market with fruit and vegetables. The water front has been improved by substantial stone walls, which permit the mooring of ocean-going vessels alongside. Rio Grande is wholly a commercial and industrial city. Its exports include salted jerked beef (*carne secca* or *carque*), preserved meats, tongues, hides, horns, hoofs, woolen fabrics, Paraguay tea, beans, onions, fruit, flour, *farinha de mandioca* (cassava flour), candles and leather. The pioneer woolen factory in Brazil, and one of the largest in the country, is in Rio Grande. Rio Grande was founded in 1737 by José da Silva Paes, who built a fort on the river near the site of the present city and called it Estreito. In 1745 the garrison and settlement was removed by Gomes Freire d'Andrade to its present site, which became a *vila* in 1751, with the name of São Pedro do Rio Grande, and a *cidade* (city) in 1807. It was the capital of the captaincy down to 1763, when it was captured by a Spanish force from Buenos Aires under the command of its governor, Don Pedro Zeballos, the seat of government being then removed to Viçosa at the northern end of the Lagoa dos Patos. The city was occupied by the national forces in the ten years' war which began in 1835, and in 1894 it was unsuccessfully besieged by a small insurgent force that had attempted to overthrow the government at Rio de Janeiro.

RIO GRANDE, a North American river, which rises in the San Juan mountains of southern Colorado, flows southeast and south in Colorado, south by west and southeast through New Mexico and southeast between Texas and Mexico to the Gulf of Mexico. Its length is approximately 1,800 mi. and for about 1,300 mi. it forms the international boundary between the United States and Mexico. It presents many features of a complex physiographic type, being first a river of the Rocky mountains, then of the interior deserts and then of the gulf coastal plain. The Mexicans call it the Rio del Norte in its upper course, the Rio Bravo in the middle section and the Rio Grande only in its course through the coastal plain. From its headwaters, 12,000 ft. above the sea, it rushes rapidly down a mountain canyon to San Luis valley, in Colorado. It flows with moderate speed through this broad valley, enters a long canyon with a maximum depth of 400 ft., about 4 mi. above the boundary between Colorado and New Mexico, and is hemmed in between canyon walls or the sides of narrow mountain valleys throughout its course in New Mexico. It passes through a series of picturesque canyons, some of them 1,750 ft. in depth, in the "Big Bend," and becomes a silt-laden stream with a shifting channel in its passage through the coastal plain. In its course through the plain its channel is so much obstructed by sand bars that it is of no importance for navigation. As the increasing diversion of the water of the upper Rio Grande for irrigation in Colorado and New Mexico resulted in a scarcity of water for this purpose in Mexico, that country complained, and to remedy the evil the reclamation service of the United States proposed the construction by the United States of a storage dam across the river, near Eagle, New Mexico. Mexico agreed to this proposal and a treaty covering the matter was proclaimed in Jan. 1907. Mexico receives 60,000 ac.ft. of water annually from the Elephant Butte reservoir in New Mexico. Since 1910 the delta of the Rio Grande, known as the Lower Rio Grande valley, has been developed by water diverted from the river. The irrigated districts, over 200,000 ac. in area, extend from the town Rio Grande

to the gulf, a distance of about 100 mi. The semitropical climate of the region makes it ideal for citrus fruit and vegetables for the winter market.

The principal cities on the river are: Brownsville, Tex.; Matamoros, Mex.; Laredo, Tex.; Del Rio, Tex.; El Paso, Tex.; Ciudad Juárez, Mex.; and Albuquerque, N.M.

RIO GRANDE DO SUL, a southern frontier state of Brazil, bounded on the north by the state of Santa Catarina, on the east by the Atlantic, on the south by Uruguay and on the west by Uruguay and Argentina—the Uruguay river forming the boundary line with the latter. Area, 105,088 sq.mi. The northern part of the state lies on the southern slopes of the elevated plateau extending southward from São Paulo across the states of Paraná and Santa Catarina, and is much broken by low mountain ranges whose general direction across the trend of the slope gives them the appearance of escarpments.

A range of low mountains extends southward from the Serra do Mar of Santa Catarina and crosses the state into Uruguay. West of this range is a vast grassy rolling upland devoted principally to stock raising—the southwestern part being suitable in pasture and climate for sheep and cattle. East of it is a wide coastal zone only slightly elevated above the sea; within it are two great tide-water lakes—Lagôa dos Patos and Lagôa Mirim—which are separated from the ocean by two sandy, barren peninsulas.

In addition to the Lagôa dos Patos and Lagôa Mirim, there are a number of small lakes on the sandy, swampy peninsulas that lie between the coast and these two. The largest lake is the Lagôa dos Patos (Lake of the Patos—an Indian tribe inhabiting its shores at the time of the discovery). The lake is comparatively shallow and filled with sand banks, making its navigable channels tortuous and difficult. The Lagôa Mirim occupies a similar position farther south on the Uruguayan frontier. Rio Grande lies within the semi-temperate zone and has a mild, temperate climate, except in the coastal zone, where it is semitropical.

There are two well-marked seasons, though the transition periods between them (about two months each) are sometimes described as spring and autumn. The winter months, June to September, are characterized by heavy rains and by cold westerly winds, called *minuano*s, which sometimes lower the temperature to the freezing point, especially in the mountainous districts. Snow is rare, but ice frequently forms on inland waters during cold winter nights, only to disappear with the first rays of the sun. In summer, which is nominally a dry season, light rains are common, northerly and easterly winds prevail and the temperature rises to 95° in the shade.

The principal industry of the state is stock raising, especially on the southern plains, where there are large *estancias* (ranches). This industry originated with the Jesuit missions on the Uruguay early in the 17th century, and its development here has been much the same as in Argentina and Uruguay. No general effort was made before the 19th century to improve the herds by the importation of better breeds, and the industry was practically in a state of decay until higher tariff rates were imposed on imported *carne secca* (jerked beef) toward the end of the 19th century. The export of livestock is insignificant, the practice being to sell the cattle to the *zarquenas*, or modern packing plants, where they are slaughtered for *sarques*, *charqui* or *carne secca*, which is usually prepared by salting and drying in the sun, or for frozen meats for southern Europe. The jerked beef is largely exported to other Brazilian states for consumption, while the hides and other by-products are exported to Europe and the U.S. Horses, sheep and swine are also raised, the raising of sheep being fostered by the building of woollen factories, and that of swine by the duties on imported pork and lard. In some parts of the state agriculture claims much attention, especially in the forested districts of the north, where colonies of foreign immigrants are established.

The forest products include *erva-mate* or Paraguay tea (*Ilex paraguayensis*), timbers and lumber and vegetable fibre (*crina vegetal*).

Coal of an inferior quality is mined at São Jerônimo, on a small tributary (Arroio dos Ratos) of the Jacuí river, and has been discovered in other localities. Lime is burned at Caçapava, and at

some other places. Gold, copper and iron are said to exist, but are not mined. Considerable progress has been made in manufacturing.

The total length of railway lines in the state was 2,165 mi. in 1949. The main lines include the one from Rio Grande to Uruguaiana; from Livramento, on the Uruguayan border, through the central part of the state to the northern border; and one from Pôrto Alegre to Santa Maria. The Quaraí to Itaquí line belongs to an English company and runs from the Uruguayan frontier, where it connects with the North-Western of Uruguay, northward to Uruguaiana and the naval station of Itaquí.

The population of the state in 1950 was 4,213,316. There is a large foreign element, the largest single group being German. The first German colony was founded in 1824 and settled in 1825 in the rich forested country north of Pôrto Alegre, and many large and prosperous communities were established thereafter in spite of the wars and political agitations in the state. Several of these colonies, such as São Leopoldo, Novo Hamburgo and Conde d'Eu (now Garibaldi), became important towns.

Italian colonies were subsequently established, also with good results, but an Irish colony founded at Monte Bonito, near Pelotas, about 1851, failed completely. The capital of Rio Grande do Sul is Pôrto Alegre (pop. 1950, 381,964), at the northern extremity of Lagôa dos Patos, and its two next most important cities are Rio Grande and Pelotas, both at the southern extremity of the same lake.

Other important cities and towns, with populations (1950) of the *municípios* in which they are located, are Alegrete (44,796), in the western part of the state on the Pôrto Alegre to Uruguaiana railway; Bagé (66,172), about 173 mi. by rail northwest of Rio Grande in a mountainous region, 702 ft. above sea level; Cachoeira (95,067) and Rio Pardo (40,438), both on the Rio Jacuí; Passo Fundo (103,704), on the plateau in the north central part of the state; Uruguaiana (49,785), a frontier town and cattle centre; Caçapava (33,392), centre of a fine grazing district in the central part of the state; and Quaraí (15,792), a town of considerable commercial importance on the Quaraí river opposite the Uruguayan town of Artigas.

History—The territory was settled along the Uruguay by the Jesuits when they were compelled to abandon their missions on the upper Paraná. Between 1633 and 1707 they founded on the east side of the Uruguay seven missions—all under Spanish jurisdiction—which became highly prosperous, and at the time of their transfer from Spanish to Portuguese rule by a treaty of 1750 had an aggregate population of about 14,000, living in villages and possessing large herds of cattle and many horses. A joint effort of the two powers in 1753 to enforce the treaty, remove the Indians to Spanish territory and mark the boundary line led to resistance and a three years' war, which ended in the capture and partial destruction of the missions.

On the coast the first recognized settlement—a military post at Estreito, near the modern city of Rio Grande—was made in 1737. Before this, and as early as 1680, according to some chroniclers, the region south of Santa Catarina was occupied by settlements or penal colonies of *degradados* (banished men) and immoral women from Santos, São Vicente and São Paulo, and was known as the *Contínente* de São Pedro.

In 1738 the territory (which included the present state of Santa Catarina) became the Capitania d'El Rei and was made a dependency of Rio de Janeiro.

Territorial disputes between Spain and Portugal led to the occupation by the Spanish of the town of Rio Grande (then the capital of the *capitania*) and neighbouring districts from 1763 to 1776, when they reverted to the Portuguese. The capture of Rio Grande in 1763 caused the removal of the seat of government to Viçosa at the head of Lagôa dos Patos; in 1773 Pôrto dos Cazares, renamed Pôrto Alegre, became the capital. In 1801 news of war between Spain and Portugal led the inhabitants of Rio Grande to attack and capture the seven missions and some frontier posts held by the Spaniards since 1763; after 1801 the boundary lines established by treaty in 1777 remained unchanged.

The districts of Santa Catarina and Rio Grande had been sepa-

rated in 1760 for military convenience, and in 1807 the latter was elevated to the category of a *capitania-geral*, with the designation of São Pedro do Rio Grande, independent of Rio de Janeiro, and with Santa Catarina as a dependency. In 1812 Rio Grande and Santa Catarina were organized into two distinct *comarcas*, the latter becoming an independent province in 1822 when the empire was organized.

In 1835 a separatist revolution broke out in the province and lasted ten years. It was reduced more through the use of money and favours than by force of arms; but the province had suffered terribly in the struggle and did not recover its losses for many years. An incident in this contest was the enlistment of Giuseppe Garibaldi for a short time with the forces of the separatists. In 1865 a Paraguayan army invaded the state and on Aug. 5 occupied the town of Uruguiana. On Sept. 18 following, the Paraguayan general (Estigarribia) surrendered without a fight—an unusual occurrence in the remarkable war that followed. Political agitations became frequent in Rio Grande do Sul, whose people had acquired something of the temperament of their Spanish neighbours, but no important revolution occurred after the "ten years' war" (1835-45) until the presidency at Rio de Janeiro of Gen. Floriano Peixoto, whose ill-considered interference with the state governments led to the revolt of 1892-94, under Gumerindo Saravia. In this struggle the revolutionists occupied Santa Catarina and Paraná, capturing Curitiba, but were eventually overthrown through lack of munitions.

RIOJA, LA, an Andean province of Argentina, bounded north by Catamarca, east by Catamarca and Córdoba, south by San Luis and San Juan and west by San Juan and Chile. Area, 35,649 sq.mi. Pop. (1947 est.) 109,776. It is traversed north to south by eastern ranges of the Andes and is separated from Chile by the Cordillera. The west part of the province is drained by the Bermejo, which flows south into the closed lacustrine basin of Mendoza. The east side of the province is arid. In the extreme north some small streams flow north into Catamarca. The scanty waters of these streams are used for irrigation purposes.

The principal industry of the province is mining, its mineral resources including gold, silver, copper, nickel, tin, cobalt, coal, alum and salt. Its best-known mines are those of the Sierra de Famatina, 16,400 ft. above sea level, where an aerial wire line is used for transportation to Chilecito in the valley. Development of mining industries has been seriously hindered by a lack of water and, for the same reason agricultural activity has been restricted in volume and area.

The climate is very hot and dry, and there is no cultivation of the soil except in the valleys of the Cordillera range and in a few other places where irrigation is possible. Under these conditions there are grown wheat in some quantity, grapes, oranges, olives and tobacco. Alfalfa is grown to a considerable extent and is used for feeding the herds of cattle driven across country to Chile.

The capital of the province is La Rioja (pop., 1941 est., 15,312), on the eastern flank of the Sierra de Velasco, about 1,770 ft. above sea level and near the gorge of Sanagasta, through which a small stream, also called Rioja, flows northward and affords water for the gardens, vineyards and orchards that surround it. The wines of Rioja are an important source of income for the district.

The town is connected by rail with Córdoba and Catamarca. It was founded in 1591 by Juan Ramírez de Velasco, governor of Tucumán, and named Ciudad Rioja la Nueva de Todos los Santos. After being destroyed by earthquake in 1894 the city was rebuilt along modern lines.

Chilecito (pop., 1941 est., 6,372) is the second largest town in the province.

RIOM, a town of central France, capital of an *arrondissement* in the department of Puy-de-Dôme, 8 mi. N. by E. of Clermont-Ferrand by rail. Pop. (1946) 12,975. Riom (*Ricomagus* or *Ricomum* of the Romans) was, along with Auvergne, seized for the crown by Philip Augustus, and was the capital of this province under the dukes of Berry and Bourbon.

Riom stands on the left bank of the Ambène, on a height above the fertile plain of Limagne. The houses, some of the 15th and

16th centuries, being built of black lava, have a sombre appearance.

The church of St. Amable, restored, of Romanesque and early Gothic architecture, dates from the 12th century. The church of Notre-Dame du Marthuret (15th century) has a well-known statue of the Virgin at its western entrance. The Sainte-Chapelle of the 14th and 15th centuries is a relic of the palace of Jean de Berry, duke of Auvergne. The rest of the site of the palace is occupied by the law courts. The 16th-century belfry and a mansion of the same period known as the Maison des Consuls are notable. Riom is the seat of a subprefect and tribunal of commerce.

RIO NEGRO, a national territory of Argentina lying between 37° 35' and 42° S. lat. and 62° 50' and 72° 15' W. long., within the geographical area formerly known as Patagonia. It is bounded north by the territories of Neuquén and La Pampa, east by the province of Buenos Aires and the Atlantic, south by the territory of Chubut and west by Chile and Neuquén. The area is 78,383 sq.mi.; pop. (1914) 42,242; (1947 est.) 133,164. That part of it lying between the Colorado and Negro rivers has much of the formation and characteristics of the "sterile pampas," but with irrigation the greater part of it can be utilized for agriculture and grazing.

South of the Negro the country is arid, barren and lies in a series of sloping tablelands. Lake Nahuel Huapi (216 sq.mi. in area), lying partly in the territory of Neuquén (*q.v.*), is the principal lake of the region. However, there are several chains of lakes in the valleys of the Andes that are considered as rivals to Swiss scenery.

The Atlantic coast line of the territory has one deep indentation—the Gulf of San Matías—in the north bend of which is the port of San Antonio Oeste. Agriculture and stock raising are the chief sources of wealth. Rio Negro usually ranks about fifth among the states and territories in the production of sheep. The capital is Viedma (pop., 1947 est. 9,000), on the right bank of the Rio Negro, 24 mi. from its mouth and opposite Carmen de Patagones, a port of Buenos Aires province. There are numerous small settlements along the Rio Negro and the railway extending inland from San Antonio Oeste, but the only other town of importance is San Carlos de Bariloche, on the shore of Lake Nahuel Huapi, one of the two western terminals of the railway from San Antonio Oeste. Other transportation facilities are furnished by the railway which crosses the northern part of the territory.

RIO PARDO (formerly Vila do Rio Pardo), a town of Brazil in the state of Rio Grande do Sul, on the left bank of the Jacuí at its confluence with the Pardo. Pop. (1950) of the municipality, 40,438. The town is about 80 mi. due west of Porto Alegre, with which it is connected by rail and steamer. The Jacuí is navigable by small steamers.

The town had its origin in a frontier fort built at this point by the Portuguese in 1752.

RIO PIEDRAS, a former city of Puerto Rico, situated on the northern coast of the island, consolidated with the capital city, San Juan, by referendum on June 4, 1951. The population was 132,369 in 1950; 19,935 in 1940; and it was 13,408 in 1930. The population of the municipal district in 1950 was 143,897; in 1940 it was 68,290; in 1930, 40,853.

RIOT, the gravest kind of breach of the peace, short of treason, known to the English law. It consists in a tumultuous disturbance of the peace by an assemblage of three or more persons who, with intent to help one another against any one who opposes them in the execution of some enterprise, actually execute that enterprise in a violent and turbulent manner, to the terror of the people.

It is not necessary that violence should be used to any person or damage done to any property. Whether the enterprise itself is lawful or unlawful is not material, the gist of the offense lying in the mode in which the enterprise is carried out (*Reg. v. Cunningham, Grahame, and Burns*, 1888, 16 Cox. C.C. 420). Nor is it material whether the enterprise is of a private or a public nature, though in the latter case the rioters may also be guilty

of sedition or treason. An assembly in its inception perfectly lawful may become a riot if the persons assembled proceed to form and execute a common purpose in the manner above stated, although they had no such purpose when they first assembled. Riot differs from "affray" in the number of persons necessary to constitute the offence, from an "unlawful assembly" in that actual tumult or violence is an essential element, and from "rout" which is an unlawful assembly that has moved towards the execution of a common purpose.

According to the decisions in *Field v. Receiver of Metropolitan Police* (1907 2 K.B. 853) and *Ford v. Receiver of Metropolitan Police* (1921 2 K.B. 344) five elements are necessary to constitute a riot:—(1) the presence of three persons at least; (2) a common purpose; (3) the execution or inception of the common purpose; (4) an intent to help one another by force if necessary against any person who may oppose them in the execution of their common purpose; (5) force or violence not merely used in demolishing, but displayed in such a manner as to alarm at least one person of reasonable firmness and courage.

It is an indictable misdemeanor at common law, but the Riot Act (1714), creates certain statutory offences for riot attended by circumstances of aggravation. That act makes it the duty of a justice, sheriff, mayor or other authority, wherever 12 persons or more are unlawfully, riotously and tumultuously assembled together, to the disturbance of the public peace, to resort to the place of such assembly and read the following proclamation: "Our Sovereign Lord the King chargeth and commandeth all persons being assembled immediately to disperse themselves, and peaceably to depart to their habitations or to their lawful business, upon the pains contained in the act made in the first year of King George for preventing tumultuous and riotous assemblies. God save the King." It is a felony to obstruct the reading of the proclamation or to remain or continue together unlawfully, riotously and tumultuously for one hour after the proclamation was made or for one hour after it would have been made but for being hindered. The act requires the justices to seize and apprehend all persons continuing after the hour, and indemnifies them and those who act under their authority from liability for injuries caused thereby. The punishment for the felony is penal servitude for life.

By s. 11 of the Malicious Damage Act 1861 (which is a re-enactment of a similar provision made in 1827 in consequence of the frame-breaking riots), it is a felony for persons riotously and tumultuously assembled together to the disturbance of the public peace to unlawfully and with force demolish or begin to demolish or pull down or destroy any building, public building, machinery or mining plant. The punishment is the same as for a felony under the Riot Act. By s. 12 it is a misdemeanor to injure or damage such building, etc. The punishment is penal servitude for seven years, or imprisonment as in the case of the two felonies above described. Under the Shipping Offences Act (1793) a riotous assemblage of three or more seamen, ship's carpenters and other persons, unlawfully and with force preventing and hindering or obstructing the loading or unloading or the sailing or navigation of any vessel, or unlawfully and with force boarding any vessel with intent to prevent, etc., is punishable on a first conviction as a misdemeanor by imprisonment for 12 months, and on a second conviction as a felony by penal servitude for 14 years.

It is the duty of a magistrate at the time of a riot to assemble subjects of the realm, whether civil or military, for the purpose of quelling the riot. In this duty he is aided by the common law, and a statute of 1714 (Henry V.), under which all subjects of the realm are bound to assist on reasonable warning, and by various enactments enabling the authorities to call out the forces for the suppression of riot, and to close public-houses where a riot is apprehended. It is his duty to keep the peace; if the peace be broken, honesty of intention will not avail him if he has been guilty of neglect of duty. The question is whether he did all that he knew was in his power and which could be expected from a man of ordinary prudence, firmness and activity. The law as thus stated is gathered from the opinions of the judges on the trials of

the lord mayor of London and the mayor of Bristol on indictments for neglect of duty at the time of the Gordon riots of 1780 and the Bristol riots in 1831.

A matter of interest is the extent of the protection afforded at common law and by the Riot Act to soldiers and others acting under the commands of their officers, and in this regard it must always be borne in mind that "a soldier for the purpose of establishing civil order is only a citizen armed in a particular manner." The question was dealt with by Lord Bowen and his fellow-commissioners in the report on the Featherstone riots (Parl. Paper, 1893-1894, C. 7234). The substance of their views is as follows:—

By the law of England every one is bound to aid in the suppression of riotous assemblages. The degree of force, however, which may be lawfully employed in their suppression depends on the nature of each riot, for the force used must always be moderated and proportioned to the circumstances of the case and to the end to be attained. The taking of life can only be justified by the necessity for protecting persons or property against various forms of violent crime, or by the necessity of dispersing a riotous crowd which is dangerous unless dispersed, or in the case of persons whose conduct has become felonious through disobedience to the provisions of the Riot Act, and who resist the attempt to disperse or apprehend them. The necessary prevention of such outrage on person or property justifies the guardians of the peace in the employment against a crowd of even deadly weapons. Officers and soldiers are under no special privileges and subject to no special responsibilities as regards the principle of the law. The whole action of the military if once called in, ought from first to last to be based on the principle of doing, and doing without fear, only that which is absolutely necessary to prevent serious crime, and of exercising care and skill with regard to what is done. No set of rules exists which governs every instance or defines beforehand any contingency that may arise. The presence of a magistrate is not essential, but is usual, and of the highest value to aid the commander of the troops by local knowledge. But his presence or absence has no legal effect on the duties or responsibilities of the military to use their arms when it becomes necessary to do so, and without recklessness or negligence and with reasonable care and caution; and where they have so acted the killing of a rioter is justifiable homicide, and the killing of an innocent bystander is homicide by misadventure. It is not usual to resort to extremities with rioters until after reading the proclamation under the Riot Act (1714), but this preliminary is by no means a condition precedent to the exercise of the common-law powers of suppressing riots.

It was decided in *Reg. v. Glamorganshire County Council, ex parte Miller* (1899 2 Q.B. 536) that there is no duty upon the county council to pay out of the county funds the expenses of the maintenance of troops which have upon the application of the county justices been brought into the county for the purpose of preserving peace and order in the county.

Until 1886 persons whose property was damaged by riot had a civil remedy of an exceptional character by action against the hundred in which the riot took place. But the old statutes were repealed and replaced by the Riot Damage Act 1886. Under this act compensation is payable where rioters have injured or destroyed houses, shops, buildings, fixed or movable machinery and appliances prepared or used for or in connection with manufactures or agriculture, or for mines or quarries, or have injured, stolen, or destroyed property in houses, shops or buildings. The compensation is payable out of the police rate for the district in which the damage is done. The remedy is available in the case of stranded ships plundered by rioters (s. 575 of the Merchant Shipping Act 1894).

(X.; W. DE B. H.)

United States.—Most States have enacted statutes which, though conforming generally to the outlines of the English law, have nevertheless common differences. See 94 Am. Dec. 36 *et seq.* In a few States only two people are required. Ga. Penal Code, 1926, sec. 360; Calif. Penal Code, 1923, sec. 404. Some States require that the acts committed be independently unlawful. Page, Ann. Ohio Code, 1926, sec. 12,809. In many others independent illegality is not essential. Cahill's Ill. Rev. Sta. 1927, ch.

38, sec. 518. There is a tendency to abolish the distinction between unlawful assembly, rout and riot by requiring merely threats of, or assembly with intent to do, such acts. Comp. Sta. Neb., 1922, sec. 9,744; Calif. Penal Code, *loc. cit. supra*. Reading of the riot act is still frequently a condition. Conn. Rev. Sta., 1918, sec. 6,336. As an additional deterrent, many statutes hold municipalities responsible to those injured by mobs or riots. Gen. Mun. Law, N.Y., Dec. 71. Diligence of municipal officers is no defence. *Arnold v. City of Centralia* (1915), 197 Ill. App. 73, 13 A.L.R. 765. The punishment for riot is generally comparatively mild. Burns Ann. Ind. Sta., 1926, sec. 2,529 (maximum fine of \$500 and/or imprisonment for maximum of three months).

Although the courts, in interpreting these statutes, still require that there be "concert of action," a defendant, who was one of the crowd, may be convicted even though he committed none of the prohibited acts. The burden of proving no participation is on him. *Commonwealth v. Merrick* (1917), 65 Pa. Super. 482. Concert of action will be "implied" from the facts. *Commonwealth v. Frishman* (1920), 235 Mass. 449, 126 N.E. 838. Similarly, "common intent," also said to be essential, is not necessarily lacking because of a failure to prove a previously existing specific agreement. It also will be "implied." *Grier v. State* (1912), 11 Ga. App. 767, 76 S.E. 70. To hold otherwise in any or all of these instances would make it extremely difficult to convict. The courts, for practical purposes, consider the objective realities, apply their own gauge of social desirability in a particular case, and then by the useful tool of "inference" find the elements previously said to be necessary. (L. A. Tu.)

RIOT AND CIVIL COMMOTION INSURANCE.

These policies cover all that is provided for by explosion insurance and in addition protect against losses due to riot, insurrection, civil commotion and strike. The rates are low, but in the case of strike, for example, they are trebled if the policy is taken out after the strike has been declared.

RÍO TINTO (MINAS DE RÍO TINTO), a mining town of southwestern Spain, in the province of Huelva; near the source of the river Tinto, and at the terminus of a light railway from the port of Huelva. Pop. (1940), 2,727 (mun., 9,060). Río Tinto is one of the greatest copper-mining centres in the world. Its modern importance dates from 1872, when a syndicate of London and Bremen capitalists purchased the mines from Spain.

RIOUW-LINGGA ARCHIPELAGO, five groups of islands off the east coast of Sumatra, extending from the Straits of Singapore in the north, to the Straits of Berhala in the south. They comprise the Karimon group, the Batam group, the Bintang group, the Lingga group, and the Singkep group, with territory on the mainland opposite known as Indragiri, and collectively they form a residency of the Netherlands Indies known as Riouw and Dependencies. The islands vary in height and area, from rocky crags and small coral reefs, to Bintang, or Riouw, the largest island, area 440 sq.mi., with a height of 1,235 ft.; Lingga and Singkep are almost as large, and the former attains a height of 3,500 ft. above sea level and has the largest alluvial plain of the archipelago. Coral reefs and currents make navigation difficult. The total area of the residency is 12,506 sq.mi. and its pop. (1930) was 298,225 (613 Europeans and Eurasians and 39,084 Chinese). On the mainland territory of Indragiri, a triangular-shaped wedge of land between the government of Sumatra East Coast and Jambi residency, which is mainly the valley of the river Kuantan and its tributaries, the people are Malays; the people of the islands are Malays, Buginese and Chinese, with a few aboriginals, about 1,000, known as Benua. The chief products of the islands are gambir, rubber, pepper and rice. The agriculture, shipping and finance of the islands are largely in Chinese hands, the Malays and Buginese selling their produce to the Chinese, who are also cultivators. There are large deposits of bauxite, of which those on Bintang were mined after 1935. In 1940, 275,000 tons were produced. The archipelago was occupied by Japan in 1942. The capital of the residency is Tanjung Pinang, opposite Singapore, also known as Riouw, or Bintang, pop. (1930) 5,789.

RIPLEY, market town and urban district of Derbyshire, England, 10 mi. N. of Derby on the L.M.S.R. Pop. (est. 1938) 17,520. Area, 8.6 sq.mi. The charter for the market, held on Saturdays, was granted by Henry III. Iron working and coal mining are the principal industries. The adjoining urban district of Heage was transferred to Ripley in 1934.

RIPON, GEORGE FREDERICK SAMUEL ROBINSON, 1ST MARQUESS OF (1827-1909), British statesman, only son of the 1st earl of Ripon and his wife Lady Sarah, daughter of Robert Hobart, 4th earl of Buckinghamshire, was born in London on Sept. 24, 1827.

Ripon began his political life as *attaché* to a special mission to Brussels in 1849. In 1851 he married Henrietta Vyner (d. 1907), and their eldest son, afterwards known as Earl de Grey, was born in 1852. Under his courtesy title of Viscount Goderich he was returned to the House of Commons for Hull in 1852 as an advanced Liberal. In 1853 he was elected for Huddersfield, and in 1857 for the West Riding of Yorkshire. In Jan. 1859 he succeeded to his father's title, and in November of the same year to that of his uncle, Earl de Grey. A few months after entering the Upper House he was appointed under-secretary for war, and in Feb. 1861 under-secretary for India. Upon the death of Sir George Cornewall Lewis in April 1863 he became secretary for war, with a seat in the cabinet. In 1866 he was appointed secretary of State for India. On the formation of the Gladstone administration in Dec. 1868, Lord Ripon was appointed lord president of the council, and held that office until within a few months of the fall of the Government in 1873, when he resigned on purely private grounds. In 1871 Lord Ripon was appointed chairman of the High Joint-Commission on the Alabama claims, which arranged the Treaty of Washington. In recognition of his services he was elevated to a marquessate (1871). In 1874 he became a convert to Roman Catholicism.

On the return of Gladstone to power in 1880 Lord Ripon was appointed viceroy of India, the appointment exciting a storm of controversy, the marquess being the first Roman Catholic to hold the viceregal office. He went out to reverse the Afghan policy of Lord Lytton, and Kandahar was given up, the whole of Afghanistan being secured to Abdur Rahman. The new viceroy extended the rights of the natives, and in certain directions curtailed the privileges of Europeans. For the libel bill of 1883—so named after its author Sir Courtenay Ilbert, *see* INDIA: History.

In 1886 he became first lord of the admiralty in the third Gladstone ministry; and on the return of the Liberals to power in 1892 he was appointed colonial secretary, which post he continued to hold until the resignation of the Government in 1895. He was included in Sir Henry Campbell-Bannerman's cabinet at the close of 1905 as lord privy seal, an office which he retained in 1908 when Asquith formed his new ministry, but which he resigned later in the same year. He died at his seat, Studley Royal, near Ripon, on July 9, 1909, when his only son, Earl de Grey, treasurer of the queen's household since 1901, became the 2nd marquess.

RIPON, a cathedral city and municipal borough in the West Riding of Yorkshire, England, 214 mi. N.N.W. from London, 30 mi. N. of Leeds, on the L.N.E.R. Pop. (1938) 8,474. Area 2.8 sq.mi. It is a foot-hill town of the Pennines, at the confluence of the Ure with its tributaries the Laver and the Skell.

Ripon (*In Rhyppum*, *Ad Ripam*) owed its origin to the monastery founded in 661, of which St. Willred became the first abbot. Tradition says that Ripon was made a royal borough by Alfred the Great and that King Aethelstan in 937 gave the borough to the Archbishop of York, and granted him privileges, as lord of the manor, of holding a market and fair. Henry I. certainly granted, or confirmed, these privileges to the Archbishops of York, who retained them until they were handed over to the Bishop of Ripon in 1837. In 1857, they were transferred to the ecclesiastical commissioners from whom they were purchased by the Corporation of Ripon in 1880. About the year 950 the monastery and town were destroyed by King Eadred during an expedition against the Danes, but the monastery was rebuilt by the Archbishops of York and about the time of the Conquest it became a collegiate church. In 1318, when the Scots invaded

England, Ripon escaped being burned a second time only by the payment of 1,000 marks.

The streets of Ripon are for the most part narrow and irregular, and although most of the houses are comparatively modern, some of them retain the picturesque gables characteristic of earlier times.

The town is popular as a holiday resort. The cathedral, with a large square central tower and two western towers, is celebrated for its fine proportions and contains various styles of architecture. It was founded on the ruins of St. Wilfred's abbey of the 7th century, but of this Saxon building nothing now remains except the crypt which is known as St. Wilfred's Needle. Apart from the crypt, the oldest part is a portion of the chapter house and vestry adjoining the south side of the choir, and ending eastward in an apse. This is pure Norman work and beneath is a crypt of that period. The present building was begun about 1154 and to this transitional period belong the transepts and parts of the choir. The west front and twin towers are fine specimens of Early English architecture and were completed about 1255. The eastern portion of the choir was rebuilt in Decorated style about the close of the 13th century. The nave and parts of the central tower and two bays of the choir are Perpendicular and were rebuilt toward the end of the 15th century.

The diocese of Ripon was created in 1836 and comprises most of the West Riding and part of the North Riding of Yorkshire and a small part of Lancashire. The episcopal palace, a modern building in Tudor style, is 1 mi. N.W. of the city. To the south-west lies Studley Royal, a former seat of the marquess of Ripon, which contains the celebrated ruins of Fountains abbey. Several old charities include the hospital of St. John the Baptist, founded in 1209, and the hospital of St. Mary Magdalene, founded by the Archbishop of York early in the 13th century as a secular community whose special duty was to administer to lepers. In the 15th century a master and chaplain took the place of the lay brethren and a chantry was founded in 1334. The chapel survives with interesting Norman work and a rare example of a pre-Reformation altar of stone.

From before the conquest until the incorporation charter of 1604, Ripon was governed by a wickman and 12 elders, but in 1604 the title of wickman was changed to mayor, and 12 aldermen and 24 councillors were appointed. Ripon sent two members to parliament in 1295, and at intervals from then until 1328-29. The privilege was revived in 1553, and continued until 1867, from when until 1885 one member was returned. Ripon is in the parliamentary division of the same name.

RISDON: *see* HOBART.

RISHANGER, WILLIAM (c. 1250-c. 1312), English chronicler, made his profession as a Benedictine at St. Alban's abbey in 1273, of which he perhaps became the official chronicler. The most important of his writings is the *Narratio de bellis apud Lewes et Evesham*. Though written many years afterward and drawn from other sources, it is a spirited account of the barons' war. He is so great an admirer of Simon de Montfort that this work has been called a hagiography. He is credited with the authorship of a chronicle covering the period 1259-1306; this has been disputed, but the work is printed under his name by Riley.

RISK, hazard, chance of danger or loss, especially the chance of loss to property or goods which an insurance company undertakes to make good to the insurer in return for the recurrent payment of a sum called the premium (*see* INSURANCE, ARTICLES ON).

RISTIĆ, JOVAN (1831-1899), Serbian statesman, was born at Kragujevac in 1831. He was educated at Belgrade, Heidelberg, Berlin and Paris. In 1861 he became Serbian diplomatic agent at Constantinople, and secured the withdrawal of the Turkish troops from the Serbian fortresses in 1867. On his return from Constantinople he became the recognized leader of the Liberal party. After the assassination of Prince Michael in 1868, he sat on the council of regency, and the first Serbian constitution

(Jan. 2, 1869), was mainly his creation. When Prince Milan attained his majority in 1872, Ristić became foreign minister, and then prime minister, but resigned in the following autumn (1873). He again became prime minister in April 1876, and conducted the two wars against Turkey (July 1876-March 1877 and Dec. 1877-March 1878). Owing to the failure to realize Serb aspirations at the Congress of Berlin, the Ristić government became unpopular, and resigned in 1880. In 1887 Milan recalled Ristić; a new constitution was granted in 1888, and in 1889 Ristić became head of the council of regency for the young king Alexander. On April 13, 1893, King Alexander, by a successful stratagem, imprisoned the regents and ministers in the palace, and, declaring himself of age, recalled the Radicals to office. Ristić died at Belgrade on Sept. 4, 1899.

RISTORI (ristò-rè), **ADELAIDE** (1822-1906), Italian actress, born at Cividale del Friuli Jan. 30, 1822, daughter of strolling players. As a child she appeared upon the stage, and at 14 made her first success as Francesca da Rimini in Silvio Pellico's tragedy. She was 18 when for the first time she played Mary Stuart in an Italian version of Schiller's play. She had been a member of the Sardinian company and also of the ducal company at Parma for some years before her marriage (1846) to the marchese Giuliano Capranica del Grillo (d. 1861); and after a short retirement she returned to the stage and played regularly in Turin and the provinces. In 1855 she took Paris by storm in the rôle of Albert's Myrrha. Furious partisanship was aroused by the appearance of a rival to the great Rachel. In 1857 she visited Madrid, playing in Spanish to enthusiastic audiences, and in 1866 she paid the first of four visits to the United States, where she had great success in Giacometti's *Elizabeth*, an Italian study of the English sovereign. She retired from professional life in 1885, and died on Oct. 9, 1906, in Rome. Her *Studies and Memoirs* (1888) contain valuable studies in the psychological explanation of the characters of Mary Stuart, Elizabeth, Myrrha, Phædra and Lady Macbeth, in her interpretation of which Ristori combined high dramatic instinct with the keenest intellectual study.

RITCHIE, CHARLES THOMSON RITCHIE, 1ST BARON (1838-1906), English politician, was born at Dundee on Nov. 19, 1838, and educated at the City of London school. He went into business, and in 1874 was returned to parliament as Conservative member for the working-class constituency of Tower Hamlets. In 1885 he was made secretary to the Admiralty, and from 1886 to 1892 president of the Local Government board, in Lord Salisbury's administration with a seat in the cabinet after 1887, sitting as member for St. George's-in-the-East. He was responsible for the Local Government Act of 1888, instituting the county councils; and a large section of the Conservative party always owed him a grudge for having originated the London County council. In Lord Salisbury's later ministries, as member for Croydon, he was president of the Board of Trade (1895-1900), and home secretary (1895-1900); and when Sir Michael Hicks-Beach retired in 1902, he became chancellor of the exchequer in Balfour's cabinet. Though in his earlier years he had been a "fair-trader," he was strongly opposed to Chamberlain's movement for a preferential tariff (*see* the articles on BALFOUR, ARTHUR JAMES BALFOUR, and CHAMBERLAIN, JOSEPH), and he resigned office in Sept. 1903. In Dec. 1905 he was created a peer, but he was in ill health, and he died at Biarritz on Jan. 9, 1906.

See the article in the *Dict. Nat. Biog. Suppl.* 1907-21.

RITSCHL, ALBRECHT (1822-1889), German theologian, was born in Berlin on March 25, 1822. His father, Benjamin Ritschl (1783-1858), was from 1827 to 1854 general superintendent and evangelical bishop of Pomerania. Albrecht studied at Bonn, Halle, Heidelberg and Tübingen. At Halle he came under Hegelian influences. In 1845 he was entirely captivated by the Tübingen school, and in *Das Evangelium Marci und das homöische Evangelium des Lukas* (1846) he appears as a disciple of F. C. Baur. But the second edition (1857) of his most im-

portant work, on the origin of the old Catholic Church (*Die Entstehung der alt-kathol. Kirche*), shows considerable divergence from the first edition (1850), and reveals an entire emancipation from Baur's method. Ritschl was professor of theology at Bonn (extraordinarius 1852; ordinarius 1859) and Göttingen (1864; *Consistorialrath* also in 1874), his addresses on religion delivered at the latter university showing the impression made upon his mind by his study of Kant and Schleiermacher. Finally, in 1864, came the influence of Rudolf Lotze. He wrote *Die Christliche Lehre von der Rechtfertigung und Versöhnung* (1870-74), and *Die Geschichte des Pietismus* (1880-86). He died at Göttingen on March 20, 1889.

Ritschl claims to carry on the work of Luther and Schleiermacher. He criticizes especially the use of Aristotelianism and speculative philosophy in scholastic and Protestant theology. He holds that such philosophy is too shallow for theology. Hegelianism attempts to squeeze all life into the categories of logic: Aristotelianism deals with "things in general" and ignores the radical distinction between nature and spirit. Neither Hegelianism nor Aristotelianism is "vital" enough to sound the depths of religious life. Neither conceives "God" as correlative to human "trust" (cf. *Theologie und Metaphysik*, esp. p. 8 seq.). But Ritschl's recoil carries him so far that he is left alone with merely "practical" experience. "Faith" knows God in His active relation to the "kingdom," but not at all as "self-existent."

Ritschl's school, in which J. G. W. Herrmann, Julius Kaftan and Adolf Harnack were the chief names, diverged from his teaching in many directions; e.g., Kaftan appreciated the mystical side of religion and Harnack's criticism was very different from Ritschl's arbitrary exegesis. They were united on the value of faith-knowledge as opposed to "metaphysic."

See H. Schoen, *Les Origines historiques de la théologie de Ritschl* (1893); G. Ecke, *Die theologische Schule, A. Ritschl's und die evangelische Kirche der Gegenwart* (1897); J. Orr, *The Ritschian Theology and the Evangelical Faith* (1898) and *Schleiermacher; expository and critical essays* (1903); A. E. Givrey, *The Ritschian Theology* (1899); E. A. Edgill, *Faith and Fact, a study of Ritschlianism* (1910); R. Mackintosh, *Ritschl* (1915). The chief authority for his biography is *Abbrecht Ritschls Leben* (2 vols., Leipzig, 1896) by his son Otto Ritschl.

RITSCHL, FRIEDRICH WILHELM (1806-1876), German scholar, was born in 1806 in Thuringia. He was well taught in youth by Spitzner, a pupil of Gottfried Hermann, spent a year at Leipzig, and in 1826 went to Halle. He went to Bonn in 1839, where he controlled a philological seminary. The names of Georg Curtius, Inne, Schleicher, Bernays, Ribbeck, Lorenz, Vahlen, Hübnér, Bücheler, Helbig, Benndorf, Riese, Windisch, who were his pupils either at Bonn or at Leipzig, attest his fame and power as a teacher. In 1865 a violent quarrel arose between him and Otto Jahn, now his colleague; he resigned, went to Leipzig, and died there in 1876. His great faculty for organization is shown by his administration of the university library at Bonn, and by the eight years of labour which carried to success a work of infinite complexity, the famous *Præcæ Latinitatis Monumenta Epigraphica* (Bonn, 1862). This volume presents in admirable facsimile, with prefatory notices and indexes, the Latin inscriptions from the earliest times to the end of the republic.

To the world in general Ritschl was best known as a student of Plautus. Ritschl's examination of the Plautine mss. was both laborious and brilliant, and greatly extended the knowledge of Plautus: for example, by the aid of the Ambrosian palimpsest he recovered the name T. Mæcius Plautus, for the vulgate M. Accius, and proved it correct by strong extraneous arguments.

In spite of the incompleteness, on many sides, of his work Ritschl must be assigned a place in the history of learning among a very select few. His studies are presented principally in his *Opuscula* collected partly before and partly since his death. The *Trinummus* (twice edited) was the only specimen of his contemporary edition of Plautus which he completed.

The facts of Ritschl's life may be best learned from the elaborate biography by Otto Ribbeck (Leipzig, 1879). An interesting estimate of Ritschl's work is that by Lucian Müller (1877).

RITTENHOUSE, DAVID (1732-1796), American astronomer, was born at Germantown, Pa., on April 8, 1732. First a watchmaker and mechanician, he afterwards became treasurer of Pennsylvania (1777-89), and from 1792 to 1795 director of the U.S. mint (Philadelphia). He was a fellow of the Royal Society of London, and a member, and in 1791 president, of the American Philosophical Society. As an astronomer, Rittenhouse's principal merit is that he introduced in 1786 the use of spider lines in the focus of a transit instrument. His researches were published in the *Transactions of the American Philosophical Society* (1785-1799). He died at Philadelphia June 26, 1796.

See *Memoir* (1813) by William Barton

RITTER, HEINRICH (1791-1869), German historian of philosophy, was born at Zerbst on Nov. 21, 1791, and died on Feb. 3, 1869, at Göttingen, where he had been professor of philosophy for nearly 30 years. Of his numerous works the most important are the *Geschichte der Philosophie* (Hamburg, 12 vols., 1829-53), and, written with Preller, the *Historia philosophæ Græco-Romanae* (1838, 7th ed. 1888).

RITTER, KARL (1779-1859), German geographer, born at Quedlinburg on Aug. 7, 1779, had already travelled much when in 1817-18 he wrote *Die Erdkunde im Verhältnis zur Natur und zur Geschichte des Menschen* (Berlin, 2 vols., 1817-1818). In 1819 he became professor of history at Frankfurt, and in 1820 professor extraordinary of history at Berlin, where he remained till his death. The second edition of his *Erdkunde* (1822-58) was on a much larger scale than the first, but he completed only the sections on Africa and the various countries of Asia. Ritter brought to his work a new conception of the subject. Geography was, to use his own expression, a kind of physiology and comparative anatomy of the earth: rivers, mountains, etc., were so many distinct organs, each with its own functions; and the structure of each country is a leading element in the historic progress of the nation. His death occurred in Berlin on Sept. 28, 1859.

See G. Kramer, *Karl Ritter, ein Lebensbild* (Halle, 1864 and 1870; 2nd ed., 1875); W. L. Gage, *The Life of Karl Ritter*, (1867); F. Marthe, "Was bedeutet Karl Ritter für die Geographie," in *Zeitschrift der Ges. f. Erdk.* (Berlin, 1879).

RITUAL [Lat. *ritus*, a custom], a term of religion, which may be defined as the routine of worship. This is a "minimum definition"; "ritual" at least means so much, but may stand for more. Without some sort of ritual there could be no organized method in religious worship. Indeed, viewed in this aspect, ritual is to religion what habit is to life and its function is similar; namely, by bringing subordinate functions under an effortless rule, to permit undivided attention in regard to vital issues. The chief task of routine in religion is to organize the activities necessary to its stability and continuance as a social institution, in order that all available spontaneity and initiative may be directed into spiritual channels.

But, whilst ritual at least represents routine, it tends, historically speaking, to have a far deeper significance for the religious consciousness. A recurrent feature of religion, which many students of its phenomena would even consider constant and typical, is the attribution of a more or less self-contained and automatic efficacy to the ritual procedure as such. Before proceeding to considerations of genesis, it will be convenient briefly to analyse the notion as it appears in the higher religions.

Two constituent lines of thought may be distinguished. Firstly, there is the tendency to pass beyond the purely petitionary attitude which as such can imply no more than the desire, hope or expectation of divine favour, and to take for granted the consummation sought, a deity that answers, a grace and blessing that are communicated. When such accomplishment of its end is assumed, efficacy can readily be held to attach to the act of worship as such. Secondly, there is the tendency to identify such a self-accomplishing act of worship with its objective expression in the ritual that for purposes of mutual understanding makes the body of worshippers one.

The Formal Element in Ritual.—Exactly similar tendencies—to impute efficacy, and to treat the ritual procedure as the

source of that efficacy—are typically characteristic of black magic, and their reappearance in religion can hardly be treated as a coincidence, seeing that magic and religion would appear to have much in common, at any rate during the earlier stages of their development. In magic a suggestion is made orally, or by dramatic action, or most often in both ways together, that is held *ipso facto* to bring about its own accomplishment. A certain conditionality attaches to the magical operation, inasmuch as each magician is subject to interference on the part of other magicians who may neutralize his spell by a counter-spell of equal or greater power; nevertheless, the intrinsic tone is that of a categorical assertion of binding force and efficacy. Again, in magic the self-realizing force is apt to seem to reside in the suggestional machinery rather than in the spiritual qualifications of the magician, though this is by no means invariably the case. On the whole, however, spells and ceremonies are wont to be regarded as an inheritable and transferable property containing efficacy in themselves. What is true of magic is true of much primitive religion.

Sir J. G. Frazer has pronounced the following to be marks of a primitive ritual: negatively, that there are no priests, no temples and no gods (which he holds that departmental, non-individual "spirits" are recognized); positively, that the rites are magical rather than propitiatory (*The Golden Bough*, 2nd ed. ii. 191). If we leave it an open question whether, instead of "spirits" it would not be safer to speak of "powers" to which there is attributed not a soul-like nature, but simply a capacity for acting with *mana* (q.v.) (which roughly is what Frazer means by "magical"), this characterization may be accepted as applying to many, if not to all, the rites of primitive religion.

As Lang well puts it, "Ritual is preserved because it preserves luck." Given an intrinsic sacredness, it is but a step to associate definite gods with the origin or purpose of a rite, whose interest it thereupon becomes to punish omissions or innovations by the removal of their blessing (which is little more than to say that the rite loses its efficacy), or by the active infliction of disaster on the community. In the primitive society it is hard to point to any custom to which sacredness does not in some degree attach, but, naturally, the more important and solemn the usage, the more rigid the religious conservatism. Thus there are indications that in Australia, at the highly sacred ceremony of circumcision, the fire-stick was employed after stone implements were known; and we have an exact parallel at a higher level of culture, the stone implement serving for the same operation when iron is already in common use. (See B. Spencer and F. Gillen, *The Native Tribes of Australia*, 401; cf. E. B. Tylor, *Early History of Mankind*, 3rd ed. 217.)

The Interpretation of Ritual.—A valuable truth insisted on by the late W. Robertson Smith (*Religion of the Semites*, 17 et seq.) is that in primitive religion it is ritual that generates and sustains myth, and not the other way about. Sacred lore of course cannot be dispensed with; even Australian aboriginal society, which has hardly reached the stage of having priests, needs its *Okimirobat* or "great instructor" (Spencer and Gillen, *ibid.*, 303). The function of such an expert, however, is chiefly to hand on mere rules for the performance of religious acts. If his lore include sacred histories, it is largely, we may suspect, because the description and dramatization of the doings of divine persons enter into ritual as a means of suggestional control. Similarly, the sacred books of the religions of middle grade team with minute prescriptions as to ritual, but are almost destitute of doctrine. Even in the highest religions, where orthodoxy is the main requirement, and ritual is held merely to symbolize dogma, there is a remarkable rigidity about the dogma that is doubtless in large part due to its association with ritual forms, many of them bearing the most primeval stamp.

As regards the symbolic interpretation of ritual, this is usually held not to be primitive; and it is doubtless true that an unreflective age is hardly aware of the difference between "outward sign" and "inward meaning," and thinks as it were by means of its eyes. Nevertheless, it is easier to define fetishism (q.v.) (a fetish "differing from an idol in that it is worshipped in its own character, not as the symbol, image or occasional residence of a deity,"

New Oxford Dictionary, Oxford, 1901) than it is to bring such a fetishism home to any savage people, the West African negroes not excluded (cf. A. B. Ellis, *The Tshi-speaking Peoples of the Gold Coast of W. Africa*, 1902). It is the intrinsic *mana*, virtue or grace residing in, and proceeding from, the material object—a power the communicability of which constitutes the whole working hypothesis of the magico-religious performance—that is valued in those cases where native opinion can be tested. Moreover, it must be remembered that in the act of magic a symbolic method is consciously pursued, as witness the very formulas employed: "As I burn this image, so may the man be consumed," or the even more explicit, "It is not wax I am scorching; it is the liver, heart and spleen of So-and-so that I scorch" (W. W. Skeat, *Malay Magic*, 570), where appearance and reality are distinguished in order to be mystically reunited.

Now it is important to observe that from the symbol as embodying an imperative to the symbol as expressing an optative is a transition of meaning that involves no change of form whatever; and, much as theorists love to contrast the suggestional and the petitionary attitudes, it is doubtful if the savage does not move quite indifferently to and fro across the supposed frontier-line between magic and religion, interspersing "bluff" with blandishment, spell with genuine prayer. Meanwhile the particular meanings of the detailed acts composing a complicated piece of ritual soon tend to lose themselves in a general sense of the efficacy of the rite, as a whole, to bring blessing and avert evil. Nay, unintelligibility is so far from invalidating a sacred practice that it positively supports it by deepening the characteristic atmosphere of mystery. Even the higher religions show a lingering predilection for cabalistic formulas.

Changes in Ritual.—Whilst ritual displays an extraordinary stability, its nature is of course not absolutely rigid; it grows, alters and decays. As regards its growth, there is hardly a known tribe without its elaborate body of magico-religious rites. In the exceptional instances where this feature is relatively absent (the Masai of East Africa offer a case in point), we may suspect a disturbance of tradition due to migration or some similar cause. Thus there is always a pre-existing pattern in accordance with which such evolution or invention as occurs proceeds. Unconscious evolution is perhaps the more active factor in primitive times; imitation is never exact, and small variations amount in time to considerable changes.

On the other hand, there is also deliberate innovation. In Australia councils of the older men are held day by day during the performance of their ceremonies, at which traditions are repeated and procedure determined, the effect being mainly to preserve custom but undoubtedly in part also to alter it. Moreover, the individual religious genius exercises no small influence. A man of a more original turn of mind than his fellows will claim to have had a new ceremony imparted to him in a vision, and such a ceremony will even be adopted by another tribe which has no notion of its meaning (Spencer and Gillen, *ibid.*, 272, 278, 281). Meanwhile, since little is dropped whilst so much is being added, the result is an endless complication and elaboration of ritual. Side by side with elaboration goes systematization, more especially when local cults come to be merged in a wider unity. Thereupon assimilation is likely to take place to one or another leading type of rite—for instance, sacrifice or prayer. At these higher stages there is more need than ever for the expert in the shape of the priest, in whose hands ritual procedure becomes more and more of a conscious and studied discipline, the naïve popular elements being steadily eliminated, or rather transformed. Not but what the transference of ritualistic duties to a professional class is often the signal for slack and mechanical performance, with consequent decay of ceremonial. The trouble and worry of having to comply with the endless rules of a too complex system is apt to operate more widely—namely, in the religious society at large—and to produce an endless crop of evasions.

Good examples of these on the part alike of priests and people are afforded by Toda religion, the degenerate condition of which is expressly attributed by Dr. W. H. R. Rivers to "the overdevelopment of the ritual aspect of religion" (*The Todas*, 454-5).

It is interesting to observe that a religion thus atrophied tends to revert to purely magical practices, the use of the word of power, and so on (*ibid.*, ch. x.). It is to be noted, however, that what are known as ritual substitutions, though they lend themselves to purposes of evasion (as in the case of the Chinese use of paper money at funerals), rest ultimately on a principle that is absolutely fundamental in magico-religious theory; namely, that what suggests a thing because it is like it or a part of it becomes that thing when the mystic power is there to carry the suggestion through.

The Classification of Rites.—More than one basis of division has suggested itself. From the sociological point of view perhaps the most important distinction in use is that between public and private rites. Whilst the former essentially belong to religion as existing to further the common weal, the latter have from the earliest times an ambiguous character and tend to split into those which are licit—"sacraments," as they may be termed,—and those which are considered anti-social in tendency, and are consequently put beyond the pale of religion and assigned to the "black art" of magic. Or the sociologist may prefer to correlate rites with the forms of social organization—the tribe, the phratry, the clan, the family and so on.

Another interesting contrast (seeing how primary a function of religion it is to establish a calendar of sacred seasons) is that between periodic and occasional rites—one that to a certain extent falls into line with the previous dichotomy. A less fruitful method of classing rites is that which arranges them according to their inner meaning. As we have seen, such meaning is usually acquired *ex post facto*, and typical forms of rite are used for many different purposes; so that attempts to differentiate are likely to beget more equivocations than they clear up. The fact is that comparative religion must be content to regard all its classifications alike as pieces of mere scaffolding serving temporary purposes of construction.

Negative Rites.—A word must be added on a subject dealt with elsewhere (*see* LABU), but strictly germane to the matter in hand. Ritual interdictions have the best, if not the sole, right to rank as taboos (*see* M. Mauss in *L'Année sociologique*, ix. 249). Taboo, as understood in Polynesia, the home of the word, is as wide as, and no wider than, religion, representing one side or aspect of the sacred (*see* RELIGION). The very power that can help can also blast if approached improperly and without due precautions. Taboos are such precautions, abstinences prompted, not by simple dread or dislike, but always by some sort of respect as felt towards that which in other circumstances or in other form has healing virtue. Thus the negative attitude of the observer of taboo involves a positive attitude of reverence from which it becomes in practice scarcely distinguishable. To keep a fast, for instance, is looked upon as a direct act of worship. It must be noted, too, that, whereas taboo as at first conceived belongs to the magico-religious circle of ideas, implying a quasi-physical transference of sacredness from that having it to one not fit to receive it, it is very easily reinterpreted as an obligation imposed by the deity on his worshippers.

The law observed by a primitive religious community abounds in negative precepts, and if early religion tends to be a religion of fear it is because the taboo-breaker provides the most palpable objective for human and divine sanctions. In the higher religions, to be pure remains amongst the most laudable of aspirations, and, even though the ceremonial aversion of a former age has become moralized, and a purity of heart set up as the ideal, it is on "virtues of omission" that stress is apt to be laid, so that a timorous propriety is too often preferred to a forceful grappling with the problems of life. There are signs, however, that the religious consciousness has at length come to appreciate the fact that the function of routine in religion as elsewhere is to clear the way for action.

RITUAL MURDER, a general term for human sacrifice in connection with religious ceremonies. False accusations as to the practice of ritual murder by various bodies have often been made. Justin Martyr in his second apology (cap. xii.) vigorously defends the Christian community against the charge; Octavius, Minutius Felix, Tertullian, Origen, and other Church Fathers all refer to the subject and indignantly repudiate the atrocious libel that the Eucharist involved human sacrifice. The myth was revived against the Montanists, and in the later middle ages against various dissenting sects of Christians. In modern times the accusation has been again levelled against "foreigners" during the disturbances in China. The chief sufferers from the libel were however the Jews. The earliest form of it (the first instance is the case of William of Norwich, 1144) was that they immolated a Christian child at Easter in mockery of the Passion. In the course of the next century there came about the elaboration that the blood was used in the manufacture of the unleavened bread for Passover (which generally coincided with Easter) or for other purposes. Ultimately, it was actually alleged that "the Jews of every province annually decide by lot" which congregation or town was to be the scene of the mythical murder. Almost invariably, the accusations were followed by spoliation and persecution. Among the classical instances are the "martyrdoms" of Hugh of Lincoln (1255) and Simon of Trent (1475), the Damascus affair (1840), and the Bellis case (1911-13). It is easy to understand how in ages when the Jews were everywhere regarded with suspicious awe such stories would find ready credence; but the revival of the myth by the anti-Semite in modern times is a deplorable instance of degeneration. That there is no foundation whatsoever for the belief is proved in the classical treatise on the subject by Hermann L. Strack, regius professor of theology at the University of Berlin. Many proselytes to Christianity have strenuously defended the Jews from the charge. Several of the popes have issued bulls exonerating them, and temporal princes have often taken a similar step. Many Christian scholars and ecclesiastics have felt it their duty to utter protests against the libel, including the most eminent Gentile students of Rabbinism of modern times. Indeed, the vast majority of the literature refuting the charge comes from non-Jewish pens. That on the other side is entirely anti-Semitic, and in no case has it survived the ordeal of criticism.

See G. A. Zavazzano, *Un Raggio di Luce* (Corfu, 1892); H. L. Strack, *Das Blut im Glauben und Aberglauben* (8th ed., Munich, 1900), Eng. trans., *The Jew and Human Sacrifice* (1909); J. D. Chwolson, *Blutanklage* (1901); F. Frank, *Der Ritualmord vor den Gerichtshöfen der Wahrheit und der Gerechtigkeit* (1901, 1902). A list of some of the most important cases is given by J. Jacobs in the *Jewish Encyclopedia*, iii. 266-267.

RIVAROL, ANTOINE DE (1753-1801), French writer and epigrammatist, was born at Bagnols in Languedoc on June 26, 1753, and died at Berlin on April 11, 1801. It seems that his father was an innkeeper of cultivated tastes. The son assumed the title of comte de Rivarol, and asserted his connection with a noble Italian family. After various vicissitudes he appeared in Paris in 1777. In his *Petit Almanach de nos grands hommes pour 1788*, in which he had the assistance of Richebourg de Champcenetz, he ridiculed contemporary authors. Rivarol wrote in the Royalist press, in the *Journal politique* of Sabatier de Castres (1784-1817) and the *Actes des Apôtres* of Peltier (1770-1825). He emigrated in 1792, and established himself at Brus-

sels, whence he removed successively to London, Hamburg and Berlin. Rivarol has had no rival in France in brilliant epigrams except Piron. His works include *Isman, ou le fatalisme* (1795), a novel; *Le Vêridique* (1827), comedy; *Essai sur les causes de la révolution française* (1827).

RIVAS, ANGEL DE SAAVEDRA, DUKE OF (1791-1865), Spanish poet and politician, born at Cordova, March 19, 1791. He fought in the War of Independence, was a prominent member of the advanced Liberal party (1820-23) and in the latter year was condemned to death. He escaped to London and lived successively in Italy, Malta and France, until the amnesty of 1834, when he returned to Spain, shortly afterward succeeding his brother as duke of Rivas. In 1835 he became minister of the interior under Istúriz, and along with his chief had again to leave the country. Returning in 1837, he joined the Moderate party, became prime minister, and was subsequently ambassador at Paris and Naples. He died June 22, 1865. In 1813 he published *Ensayos políticos*, and between that date and his first exile several of his tragedies (the most notable being *Alator*, 1814, and *Lanusa*, 1812) were put upon the stage. Traces of foreign influence are observable in *El Moro Expósito* (1834), a narrative poem dedicated to John Hookham Frere; these are still more marked in *Don Alvaro o la Fuera del sino* (first played March 22, 1835), a drama of historical importance inasmuch as it established the new French romanticism in Spain.

Gonzalez Ruiz, *El duque de Rivas* (Madrid, 1944).

RIVER AND RIVER ENGINEERING. A river is any natural stream of fresh water, larger than a brook or creek, which flows in a well-defined channel. Usually it discharges into another and larger body of water, the ocean, a lake, or another river. In rare instances in regions of porous soil it soaks into the ground, or, in excessively arid regions, evaporates, in which case it becomes a "lost river." In other regions of favourable rock conditions it may also run underground for certain distances, disappearing and reappearing one or more times. A river with a well-cut channel and a graded bed, usually reaching base level at its mouth, is an adolescent river. Rivers as they grow older usually widen their valleys accordingly unless prevented by certain geological formations or occurrences. A river whose upper waters sometime in the past suddenly found a new outlet, diminishing the volume and force of the original river and also its length, is known as a beheaded river. For other facts relating to the origin and subsequent development of rivers and their valleys see GEOGRAPHY and GEOLOGY. The river works which the engineer may be called upon to execute vary widely in their character and object. The more important of these which are described in the present article may be grouped under the following heads:—(1) The prevention of river inundations and the mitigation of their effects; (2) the improvement for navigation of the non-tidal portions of rivers; and (3) works for the improvement of navigation in the tidal compartments of rivers, in their estuaries, and at the outlets of rivers flowing into tideless seas. Other river engineering works are dealt with under separate headings, for instance, the utilization of river waters for power production (see ELECTRICAL POWER GENERATION: *Hydroelectric Generation*; etc.); works for water storage and supply for various purposes including irrigation (q.v.); works connected with fisheries (q.v.); and reclamation of land (see COAST PROTECTION AND LAND RECLAMATION). See also the articles on HYDRAULICS, CANALS AND CANALIZED RIVERS, WEIR, and particular rivers, e.g., MISSISSIPPI and DANUBE.

PHYSICAL CHARACTERISTICS OF RIVERS

River Basins.—In general the size of rivers above any tidal limit and their average fresh-water discharge are proportionate

to the extent of their basins, and the amount of rain over those basins.

They vary in extent according to the configuration of the country, ranging from the insignificant drainage areas of streams rising on high ground near the coast and flowing straight down to the sea, to immense parts of continents, where rivers rising on the slopes of mountain ranges far inland have to traverse vast stretches of valleys and plains before reaching the ocean.

The comparative size of the principal river systems of the world is shown in the following table:

River	Drainage basin in square miles	Length in miles
Nile	1,293,000	4,090
Missouri-Mississippi	1,443,700	3,971
Amazon	2,723,000	3,960
Ob	1,150,000	3,200
Yangtze	686,000	3,100
Congo	1,415,000	2,900
Amur-Kerulen	787,000	2,900
Leis	1,000,000	2,800
Yenisei	792,000	2,800
Hwang-ho	855,000	2,600
Niger	580,000	2,600
MacKenzie	539,000	2,574
Rio de la Plata	1,198,000	2,550
Murray	550,000	2,510
Volga	263,100	2,510
St. Lawrence	354,000	1,000
Dnubie	330,300	1,795
Indus	374,000	1,700
Orinoco	420,000	2,100
Brakmsputra	307,000	1,680
Zambesi	573,500	1,500

Available Rainfall.—The rainfall varies considerably in different localities, both in its total yearly amount and in its distribution throughout the year; also its volume fluctuates from year to year.

Even in small river basins the variations may be considerable according to differences in elevation or distance from the sea, ranging, for instance, in the Severn basin in England and Wales, with an area of only 4,350 sq. mi., from an average of less than 30 in. in the year to more than 80 in. The proportion, moreover, of the rain falling on a river basin which actually reaches the river, or the available rainfall in respect to its flow, depends very largely on the nature of the surface strata, the slope of the ground and the extent to which it is covered with vegetation, and varies greatly with the season of the year. The available rainfall has, indeed, been found to vary from 75% of the actual rainfall on impermeable, bare, sloping, rocky strata, down to about 15% on flat, permeable soils.

Fall of Rivers.—The rate of flow of rivers depends mainly upon their fall, though where two rivers of different sizes have the same fall, the larger river has the quicker flow, as its retardation by friction against its bed and banks is less in proportion to its volume than that of the smaller river. The fall of a river corresponds approximately to the slope of the country it traverses. As rivers rise close to the highest part of their basins, generally in hilly regions, their fall is rapid near their source and gradually diminishes, with occasional irregularities, until, in traversing plains along the latter part of their course, their fall usually becomes quite gentle. Accordingly, in large basins, rivers in most cases begin as torrents with a very variable flow, and end as gently flowing rivers with a comparatively regular discharge.

Variations in the Discharge of Rivers.—In tropical countries, subject to periodical rains, the rivers are in flood during the rainy season and have hardly any flow during the rest of the year; while in temperate regions, where the rainfall is more evenly distributed throughout the year, evaporation causes the available rainfall to be much less in hot summer weather than in the winter months, so that the rivers fall to their low stage in the summer and are liable to be in flood in the winter. In fact, with a temperate climate, the year may be divided into a warm and a cold season, extending, in the northern hemisphere, from May to October and from November to April respectively. The rivers are low and moderate floods are of rare occurrence during the first period, and they are high and subject to occasional heavy floods after a considerable rainfall during the second period. The

only exceptions are rivers which have their sources amongst mountains clad with snow, and are fed by glaciers; their floods occur in the spring and summer from the melting of the snows and ice, as exemplified by the Rhone above the Lake of Geneva, and the Arve which joins it below. But even these rivers are liable to have their flow modified by the influx of tributaries subject to different conditions, so that the Rhone below Lyons has a more uniform discharge than most rivers, as the summer floods of the Arve are counteracted to a great extent by the low stage of the Saone flowing into the Rhone at Lyons, which has its floods in the winter when the Arve on the contrary is low.

Transportation of Materials by Rivers.—In flood-time rivers bring down a large quantity of detritus, derived mainly from the disintegration of the surface-layers of the hills and slopes in the upper parts of the valleys by glaciers, frost and rain. The power of a current to transport materials varies approximately as the square of its velocity, so that torrents with a rapid fall near the sources of rivers can carry down rocks, boulders and large stones. These are by degrees ground by attrition in their onward course into shingle, gravel, sand and silt which are carried forward by the main river towards the sea, or partially strewn over flat alluvial plains during floods. The size of the materials forming the bed of the river or borne along by the stream becomes less as the reduction of velocity diminishes the transporting power of the current. In the Po, for instance, pebbles and gravel are found for about 140 m. below Turin, sand along the next 100 m., and silt and mud in the last 110 m. When, however, the fall is largely and abruptly reduced, as in the case of rivers emerging straight from mountainous slopes upon flat plains, deposit necessarily occurs owing to the sudden reduction of velocity. If the impeded river is unable to spread its detritus over the plains, its bed becomes raised by deposit, causing the river in flood-time to rise to a higher level. The materials, moreover, which are carried in suspension or rolled along the bed of the river tend to deposit when the flow of the river slackens and is finally brought to rest on encountering the great inert mass of the sea. This is the cause of the formation of the bars and, especially in the absence of a tide and any littoral current, of the deltas with their shallow outlets which occur at the mouths of many rivers.

Influence of Lakes on Rivers.—A depression along part of a valley, with a rocky barrier at its lower end, causes the formation of a lake in the course of the river flowing down the valley. The intervention of a lake makes the river, on entering at the upper end, deposit all the materials with which it is charged in the still waters of the lake. The river issues at the lower end as a perfectly clear stream with a regular discharge, because the floods, in flowing into the lake, are spread over a large surface, and so produce only a very slight raising of the level. This effect is illustrated by the river Rhone, which enters the lake of Geneva as a turbid, torrential, glacier stream, and emerges at Geneva as a sparkling, limpid river with uniform flow, though in this particular case the improvement is not long maintained, owing to the confluence a short distance below Geneva of the large, rapid, glacial river, the Arve.

The influence of lakes on rivers is, indeed, wholly beneficial, in consequence of the removal of their burden of detritus and the regulation of their flow. Thus the Swine outlet channel of the Oder into the Baltic is freed from sediment by the river having to pass through the Stettiner Haff before reaching its mouth. The St. Lawrence, again, deriving most of its supply from the chain of the Great Lakes possesses a very uniform flow.

River Channels.—The discharge of the rainfall erodes the beds of rivers along the lowest parts of the valleys; but floods occur too intermittently to form and maintain a channel large enough to contain the augmented flow. A river channel, indeed, generally suffices to carry off the average flow of the river, whilst, whilst comprising considerable fluctuations in volume, furnishes a sufficiently constant erosive action to maintain a fairly regular channel. But rivers having soft beds and carrying down sediment erode their beds during floods and deposit alluvium in dry weather. As the velocity of a stream increases with its fall, the size of a channel conveying a definite average flow varies inversely

with the fall, and the depth inversely with the width. A river channel, accordingly, often presents considerable irregularities in section, forming shallow rapids when the river flows over a rocky barrier with a considerable fall, and a succession of pools and shoals when the bed varies in compactness and there are differences in width, or when the river flows round a succession of bends along opposite banks alternately.

A river flowing through a flat alluvial plain has its current readily deflected by any chance obstruction or by any difference in hardness of the banks, and generally follows a winding course, which tends to be intensified by the erosion of the concave banks in the bends from the current impinging against them in altering its direction round the curves. (For Prof. James Thomson's theory of the concave banks of rivers see his *Collected Papers* [1912], also the article *HYDRAULICS* and Hunter's *Rivers and Estuaries*.) Large rivers bringing down a considerable amount of detritus shift their courses from time to time, owing to the obstructions produced by banks of deposit.

Floods of Rivers.—The rise of rivers in flood-time depends not merely on the amount of the rainfall, but also on its distribution and the nature of the strata on which it falls. The upper hilly part of a river basin often consists of impermeable strata, sometimes almost bare of vegetation. Consequently the rain flowing quickly down the impervious, sloping ground into the water-courses and tributaries feeding the main river produces rapidly rising and high floods in these streams, which soon pass down on the cessation of the rain. The river Marne, draining an impermeable part of the upper Seine basin, is subject to these sudden torrential floods in the cold season. On the contrary, rain falling on permeable strata takes longer in reaching the rivers, and the floods rise more gradually, are less high, continue longer and subside more slowly. A river fed by several tributaries, some from impermeable and others from permeable strata, experiences floods of a mixed character. An example is the Seine at Paris, below the confluence of the torrential Marne and Yonne, where the floods of the gently flowing Upper Seine and other tributaries with permeable basins also contribute to the rise of the river.

High floods are caused by a heavy rainfall on land already sodden by recent rains at a period of the year when evaporation is inactive, and especially by rain falling on melting snow. A fairly simultaneous rainfall over the greater part of a moderate-sized river basin is a tolerably common occurrence; and under such conditions, the floods coming from the torrential tributaries reach their maximum height and begin to subside before the floods from the gently flowing tributaries attain their greatest rise.

THE REGULATION OF NON-TIDAL RIVERS

Mitigation of Floods and Protection from Inundations.—As the size of the channel of a river is generally inadequate to carry down the discharge of floods, the river overflows its banks in flood-time and inundates adjacent low-lying lands. An enlargement of the river bed, principally by deepening it, in order to increase its discharging capacity, is precluded by the cost, and also, in rivers bringing down sediment, by the large deposit that would take place in the enlarged channel from the reduction in the velocity of the current when the flood begins to subside. Where, however, the depth of a tidal river has been considerably increased by dredging, the enlargement of its channel and the lowering of its low-water line facilitate the passage of the land water and consequently reduce the danger of flooding. The Glasgow quays, for instance, along the deepened Clyde are no longer subject to inundation, and the lands and quays bordering the Tyne have been relieved from flooding for 10 m. above Newcastle by the deepening of the river from Newburn to the sea. (See fig. 6.)

In certain cases it is important to restrict or to prevent the inundation of some riparian districts by embankments; and occasionally low-lying lands are so unfavourably situated that pumping has to be employed.

The flow of water off the slopes of a valley can be retarded by planting trees on mountain slopes, which have too often been denuded by the reckless clearing of forests.

Proposals have sometimes been made to reduce the height of floods in rivers and restrict the resulting inundations by impounding some of the flood discharge by the construction of one or more dams across the upper valley of a river, and letting it out when the flood has passed down. This arrangement, however, is open to the objection that in the event of a second flood following rapidly on the first, there might not be time to empty the reservoir for its reception. When this provision against floods can be combined with the storage of water for economic use it becomes financially practicable. A number of dams were constructed with flood control as their primary or secondary function. This was particularly true in the United States where during the 25-year period ending in 1952, 300 projects had been constructed in the interest of flood control, 77 of which were dams, while the remainder were local protection projects. The flood control project in the lower Mississippi river valley included five reservoirs, four of which had been completed.

Methods of Increasing the Discharging Efficiency of River Channels.—The discharging efficiency of a river within the limits of its bed depends on the fall and the cross section of the channel. The only way of increasing the fall is to reduce the length of the channel by substituting shorter cuts for a winding course. This involves some loss of capacity in the channel as a whole, and in the case of a large river with a considerable flow it is very difficult to maintain a straight cut, owing to the tendency of the current to erode the banks and form again a sinuous channel. Cuts therefore should be in the form of one or more flat curves. Nevertheless, where the available fall is exceptionally small, as in lands originally reclaimed from the sea, such as the English fen districts, and where, in consequence, the drainage is in a great measure artificial, straight channels have been formed for the rivers and "drains."

The removal of obstructions, whether natural or artificial, from the bed of a river furnishes a simple and efficient means of increasing the discharging capacity of its channel, and, consequently, of lowering the height of floods. Every impediment to the flow, in proportion to its extent, raises the level of the river above it so as to produce the additional fall necessary to convey the flow through the restricted channel, thereby reducing the total available fall. In the absence of legal enactments for the conservancy of rivers, numerous obstructions have in many cases been placed in their channels, such as mining refuse, sluice gates for mills, fish traps, unduly wide piers for bridges and solid weirs, which impede the flow and raise the flood level.

Prediction of Floods.—The rise of floods in the tributaries of a river, and the periods they take in passing down to stations on the main river, are ascertained by means of gauges at suitable points. With the help of these records, and full information of the rainfall over the basin area, the time of arrival and height of the top of the flood at any station can be predicted with remarkable accuracy. By telegraphing warnings to places on the river, weir keepers are enabled to open fully beforehand the movable weirs for the passage of the flood, and the riparian inhabitants receive timely warning. On some rivers, as for example the Mississippi, the Danube and the Po, the flood-prediction services serve also for the dissemination of information as to conditions of navigation, as for instance on the river Danube.

Embankments.—Where it is important to protect land from inundations, the overflow of the river must be confined within continuous embankments. By placing these embankments somewhat back from the margin of the river bed, a wide flood channel is provided for the discharge of the river directly it overflows its banks. Low embankments may be sufficient where only exceptional summer floods have to be excluded from meadows. Occasionally the embankments are raised high enough to retain the floods during most years, while provision is made for the escape of the rare exceptionally high floods at special places in the embankments, where the scour of the issuing current is guarded against, and the inundation of the neighbouring land is least injurious. Both the above methods afford the advantage of relieving the embanked channel of some of the sediment deposited

in it by the confined floodwaters, when the surplus flow passes over the embankments.

When complete protection from inundations is required, the embankments have to be raised well above the highest flood level, after allowing for the additional rise resulting from the confinement of the flood within the embankments. The system has been adopted where tracts of fertile alluvial land below flood level stretch for long distances away from the river. Thus the fens of Lincolnshire, Cambridgeshire and Norfolk in England are protected from inundations by embankments along their rivers and drains; a great portion of the Netherlands is similarly protected; and the plains of Lombardy are shut off from the floods of the Po by embankments along each side of the river for a distance of about 265 mi.

When towns like New Orleans on the Mississippi, and Szegedin on the Theiss in Hungary, have been established below the flood level of an adjoining river, the channel of the river should be improved to facilitate the passage of floods past the town. The town also should be enclosed within embankments raised above the highest possible flood level to obviate the contingency of an exceptional flood, or a gradually raised flood level leading to a catastrophe such as overwhelmed the greater part of Szegedin in March 1879 and threatened New Orleans in 1927.

The Mississippi.—A system of levee embankments has been extensively developed along the Mississippi river in its alluvial valley extending from Cape Girardeau, Mo., to the Head of Passes in the delta, a distance of 1,014 mi. by river channel. The alluvial valley has a length in latitude of 600 mi. and ranges from 20 mi. to 80 mi. in width with a total area of 30,000 sq. mi. It comprises the St. Francis, the Yazoo, the Tensas, the Lafourche, the Atchafalaya and portions of the White and Arkansas basins, as well as the alluvial lands around Lake Pontchartrain (fig. 1).

These levees, begun by the French settlers in Louisiana in the early 18th century, were in 1735 about 3 ft. high and had been constructed from 30 mi. above New Orleans to 12 mi. below. From this beginning the system has been extended, until by 1951 the system included 2,780 mi. of levees having an average height of 24 ft. and a content of about 1,310,000,000 cu. yd. of earth. The levees above Baton Rouge, La., are roughly parallel to the river but have a width between them of from 4 mi. to 15 mi. thereby greatly increasing the cross-section area of the river in times of flood. Below Baton Rouge the levees follow the bends in the river but are set back from the river bank sufficiently to prevent undercutting by the current during floods. In some parts the spacing is much greater. The low-water discharge, measured at New Orleans, 123 mi. from the mouth of the Southwest pass, has been as low as 49,200 cu. ft. per second. At Vicksburg, Miss., a discharge of 1,800,000 sec.-ft. was recorded in 1927 (estimated 2,278,000 sec.-ft. if flood had been confined to leveed river) which compares with the minimum of record of 93,800 sec.-ft. at that place. The levees had not been adequate during certain floods to withstand the water pressure which had (before the record flood of 1927) a maximum rise at Vicksburg of 61 ft. above the lowest stage of record at that point. In 1927 the river at Vicksburg rose 24 ft. higher and 65.2 ft. above the low stage of 1940. The floods tend to increase in height due to the confinement of the river between levees. Breaches, or crevasses as they are termed in the United States, have occurred during extraordinary flood, but no crevasses have occurred since 1928 in the lower Mississippi river valley. They produce a sudden rush of the flood waters through the opening, which is damaging to the land in the immediate vicinity of the breach but the general inundation is gradual and benefits the lands with a fertilizing deposit. The velocity of the outflowing water is rapid only immediately in front of a crevasse and the water creeps over the delta lands generally, aided by the sloping down of the land on the alluvial plains for some distance away from the river.

The great floods of the Mississippi and its tributary rivers in April-June 1927, were the most serious which had occurred since records of these rivers have been kept. They were due to the extraordinary coincidence of flood conditions in all the chief tributaries of the river. Normally the eastern floods usually culmi-

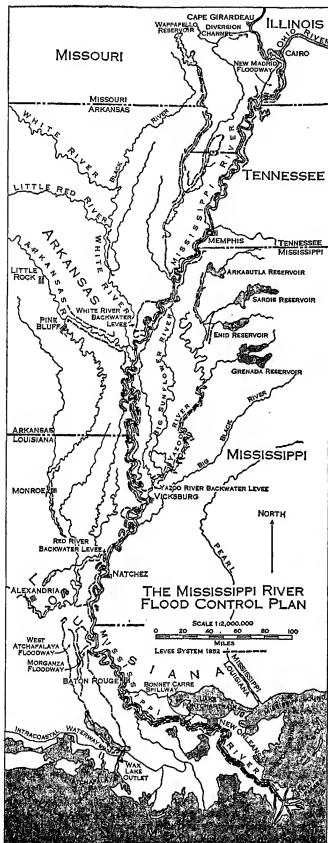

FIG. 1.—MAP OF MISSISSIPPI RIVER SHOWING AREAS SUBJECT TO OVERFLOW AND REQUIRING PROTECTIVE ENGINEERING

nate between January and April, while the crests of the Missouri river floods usually enter the Mississippi in June. In 1927 the levees were breached in many places and the floodwaters overflowed throughout the alluvial valley. An area of more than 23,000 sq.mi. was inundated and 700,000 people were driven from their

homes. Apprehension was averted at the city of New Orleans by cutting a gap in the levees at Poydras, a few miles below the city, thus permitting a part of the floodwaters to take a short course of about 5 mi. to an arm of the sea instead of following the normal course of the river through the delta.

In Jan.-Feb. 1937 while the greatest flood of record was developing in the Ohio river, the conditions in the Mississippi river were favorable for receiving and disposing of this unprecedented discharge. The lower Mississippi was called on to carry a flood of more than 2,000,000 sec.-ft. The improved levee system successfully held the water within bounds, except in backwater areas of the tributaries. The Bonnet Carre spillway, 23 mi. above New Orleans, was put into operation late in January when it became apparent that the oncoming floodwaters would raise the stage at New Orleans above 20 ft. The floodway diverted a maximum of about 200,000 sec.-ft. into Lake Pontchartrain and held the crest at New Orleans to 19.3 ft. Without the relief afforded by the spillway, it is estimated that the stage at New Orleans would have been about 3 ft. higher. The Bonnet Carre floodway was also operated successfully in 1945 and in 1950. The 1950 flood, which produced the third highest stage of record at Cairo, Ill., was safely carried to the Gulf of Mexico within the levee system and control works.

In the early 1930s a system of channel cutoffs was inaugurated on the lower Mississippi river. By 1941, they had demonstrated their worth by lowering river stages more than 12 ft. at Arkansas City, Ark., and 6 ft. at Vicksburg. Sixteen such cutoffs reduced the river distance from Memphis, Tenn., to Baton Rouge by 170 mi.

Effect of Embankments upon the River Levels and Bed.

The confinement of a river to a flood channel of restricted width necessarily produces an increase in the elevation of the high-water surface. It has also been frequently asserted that this confinement by the construction of embankments is accompanied by a progressive and consequential rising of the river bed, but there does not appear to be sufficient evidence to bear out this conten-

FIG. 2.—RIVER WAAL AT TIEL, HOLLAND, SHOWING THE CONDITION OF THE TIEL REACH IN 1896 AND 1927
The regulation works completed in this reach in 1911 have effected a permanent deepening of the channel and no dredging has been necessary since

tion. That river beds in those reaches where the steeper slope of hill valleys changes to the lesser slope in the plain become raised by deposit has already been mentioned. The river Po and the Hwang-Ho or Yellow river in China are frequently adduced as affording evidence of the raising of river beds in consequence of embanking; but where elevation, not attributable to the natural deposit, has taken place it seems to have been due to changes in the locus of the bed or to be local in character and accompanied by a corresponding deepening elsewhere. This question is discussed at length by John Lane Van Ornum, Curtis McDonald Townsend and John Ripley Freeman (*Trans. Am. Soc. of C.E.* 1928) and other authorities who are unable to accept the theory of consequential raising of the river bed.

Local Protection Projects.—The above discussions are pertinent to the protection of extended continuous areas along a river.

Levees and flood walls are also utilized for localized protection of municipal areas. After 1930 the United States especially developed many local protection projects of the latter type, designed to provide a higher degree of protection for highly developed industrial and residential areas than had been customary for the continuous embankment type of protection. A good example of a local protection project is that for the protection of Kansas City, Kan., and Kansas City, Mo., located at the junction of the Missouri and the Kansas rivers which provides for construction of a combination levee and flood wall; construction of pumping plants; construction of a river cutoff and a highway bridge across the cutoff; and alteration of 14 bridges across the Kansas river and 2 across the Missouri river.

REGULATION OF THE NONTIDAL PORTIONS OF RIVERS FOR NAVIGATION

As a river flows onward toward the sea, the current becomes more gentle and the discharge larger in volume and less subject to abrupt variations. Large rivers, therefore, often furnish important natural highways for inland navigation in the lower portions of their courses, as, for instance, the Rhine, the Danube and the Mississippi. Works are, however, often required in such rivers for preventing changes in the course of the stream, for regulating its depth, and especially for fixing the low-water channel and concentrating the flow in it, in order to increase as far as practicable the navigable depth at the lowest stage of the water level. Regulation works for increasing the navigable capabilities of rivers can be advantageously undertaken only in large rivers with a moderate fall and a fair discharge at their lowest stage; for with a large fall the current presents a great impediment to upstream navigation, and there are generally great variations in water level. Consequently, when the discharge becomes very small in the dry season it is impossible to maintain a sufficient depth of water in the low-water channel.

Removal of Shoals.—The possibility of securing uniformity of depth in a river by the lowering of the shoals obstructing the channel depends upon the nature of the shoals. A soft shoal in the bed of a river is caused by deposit from a diminution in velocity of flow, produced by a reduction in fall and by a widening of the channel, or to a loss in concentration of the scour of the main current in passing over from one concave bank to the next on the opposite side. These changes from one side of the river to the other are called "crossings." The lowering of such a shoal by dredging merely effects a temporary deepening, for it soon forms again. The removal, moreover, of the rocky obstructions at rapids produces a lowering of the river above the rapids by facilitating the efflux, which may result in the appearance of fresh shoals at the low stage of the river. Where, however, narrow rocky reefs or other hard shoals stretch across the bottom of a river and present obstacles to the erosion by the current of the soft materials forming the bed of the river above and below, their removal may enable the river permanently to deepen its bed by natural scour.

The deepening of the bed of a nontidal river along a considerable length by dredging merely lowers the water level of the river during the low stage; and though this deepening facilitates the passage of floods in the first instance, it does not constitute a permanent improvement even in this respect, for the deposit of the detritus brought down by the river as the floods abate soon restores the river to its original condition. Nevertheless, where sandbanks obstruct and divert the channel of a river at its low stage, as in parts of the Mississippi below Cairo, it has been found possible before the river has fallen to its lowest level to form a channel through these sandbanks with a depth of 9 ft. and 300 ft. wide. The project provided for an ultimate depth of 12 ft. to be secured by a program of bank stabilization (*see DREDGERS AND DREDGING*). Sand is discharged through floating pipe lines into a part of the river away from the channel; and the navigation can thus be maintained through the low stage at a reasonable cost. Though, however, these channels across the shoals, connecting the deeper parts of the river, can be easily kept open on the Mississippi till the return of the floods, they are obliterated by the currents in

floodtime, and have to be dredged out afresh every year on the abatement of the floods.

Low-water Channel.—The concentration and fixation of the low-water channel is effected by closing subsidiary low-water channels with dikes across them, and narrowing the channel at the low stage by low-dipping cross dikes extended from the river banks down the slope, and sometimes pointing slightly upstream so as to direct the water flowing over them into a central channel. The contraction of the channel can occasionally be more effectually accomplished, though at a greater cost, by low longitudinal dikes placed along either side of the low-water channel, some distance forward from the banks but connected with them generally at intervals by cross dikes at the back to prevent the current from scouring out a channel behind them during floods. By raising these dikes only slightly above the surface of the bed of the river, except where it is expedient to produce accretion for closing an old disused channel or rectifying the course of the river, the capacity of the channel for discharging floods is not affected; for the slight obstruction to the flow produced by the dikes at the sides is fully compensated by the deepening of the low-water channel in the central course of the river.

This system of obtaining a moderate increase in depth during the low stage of a river, while leaving the river quite open for navigation, has been adopted on the Rhône, the Rhine and the Mississippi. In the case of the Rhône below Lyons regulation works were preferred to canalization, in spite of the rapid fall of the river amounting in some places to 1 in 250, on account of the large quantities of sand and gravel carried down by it. The comparative regularity of the discharge, due to the flow being derived from tributaries having their floods at different times of the year, has aided the effects of the works. However, because of the unfavourable natural condition of the river, the depth does not exceed 5 ft. at lowest water level; and the rapid current forms a serious impediment to upstream navigation.

The Rhine is much better adapted for improvement by regulation works than the Rhône, for it has a basin more than double the area of the Rhône basin, and its fall does not exceed 3. ft. per mile at Strasbourg, Fr., and 2.5 ft. per mile through the rocky defile from Bingen to Kaub, Ger., and is much less along most of the length below Strasbourg. These works systematically carried out in wide shallow reaches between the Dutch frontier and Mainz, Ger., aided by dredging where necessary, have secured a navigable depth at the low stage of the river of 10 ft. from the frontier to Cologne, 8½ ft. from Cologne to Kaub, and 6½ ft. up to Bingen, beyond which the same depth is maintained up to Philippsburg, 22½ mi. above Mannheim, and is being extended up to Strasbourg. (*See also CANALS AND CANALIZED RIVERS.*)

Soon after reaching the Dutch frontier in its seaward course the Rhine divides into three branches of which the most important is the Waal taking about two-thirds of the water of the undivided river. The Waal and its westward continuations under various names form the main navigable waterway between Germany and Rotterdam, Neth., and the sea. The improvement of the Waal was commenced about the middle of the 19th century, but the works carried out in it between 1909 and 1916 afford one of the most interesting and successful examples of river regulation effected in the present century (fig. 2). The channel at its low stage was deepened, throughout its length of 53 mi. from 7½ ft. to 11½ ft. almost entirely by training works, regulation of width, and its reformation in curved reaches, so that nowhere is there a straight section left in the river. Low spur groynes or cross dikes were largely employed and very little dredging work was necessary. After 1916 no dredging was required to maintain the depths.

The Mississippi also, with its extensive basin and its moderate fall in most parts, is well suited for having its navigable depth increased by regulation works. Locks and dams were built from St. Paul, Minn., to the mouth of the Missouri river just above St. Louis, Mo., furnishing a navigable depth of 9 ft. except when the river is closed by ice conditions. Project depths in the early 1950s were as follows: St. Louis to Cairo, 9 ft. or better; Cairo to Baton Rouge, 12 ft.; Baton Rouge to New Orleans, 35 ft.; and New Orleans to the Gulf through Southwest pass, 40 ft.

South pass of the Mississippi delta for improvement by parallel jetties in 1876-79, in spite of the Southwest pass possessing a larger channel and a better depth over its bar, was due, as at the Danube, to motives of economy, as the bar of the Southwest pass was twice as far off the shore as that of the South pass (fig. 4). Fascine-mattress jetties, 2½ mi. and 1½ mi. long, weighted with limestone, and with large concrete blocks at their exposed ends, were constructed. The jetties, which were curved slightly southward at their outer ends to direct the sediment-bearing current more directly at right angles to the westerly littoral current, increased the depth of 8 ft. over the bar in 1875 up to 31 ft. between the jetties and out to deep water. The prolonged flow of the river produced by the jetties has, as at the Sulina outlet, carried the main portion of the heavier sediment into fairly deep water, so that the greatest advance of the foreshore in front of the South pass has occurred in the 70-ft. line of soundings, though the shallower soundings have also advanced. The shoaling, however, in the jetty channel necessitated its reduction in width by mattresses and spurs from 1,000 ft. to 600 ft., and eventually the jetties were rebuilt on lines reducing the channel width to about 650 ft. Dredging was also required to maintain the stipulated central depth of 30 ft., and 26-ft. depth for a width of 200 ft. out to deep water; while the outer channel was deflected to the east and narrowed by the alluvium carried westward by the littoral current and also deposited in front of the jetty outlet. Since 1901 suction dredging, the construction of additional sills and the increased discharge at the South pass (due to the works carried out in the Southwest pass) have widened the channel across the bar to about 600 ft., and given it a minimum depth of 30 ft.

In order to provide for the increasing requirements of seagoing vessels, the formation of a channel 35 ft. deep and 2,000 ft. wide through the larger Southwest pass and its 9-ft. bar to deep water in the gulf was begun at the end of 1903. The discharge through this pass is rather more than three times that through the South pass and the bar was double the distance seaward of the outlet. Converging jetties, about 5,600 ft. apart at their land ends, and about 3,000 ft. apart at the seaward outlet, were substituted for the parallel jetties constructed at the South pass, and suction dredging was relied upon to maintain the channel between the jetties. The channel dredging was soon found to be excessive in quantity and in 1916 the project was modified by limiting the channel to a width of 2,400 ft. between two parallel interior jetties, and the extension of the latter to the 30-ft. contour beyond the bar. In 1923 the width was still further restricted to 1,750 ft. by building spur dikes or groynes, and by 1924 a depth of 35 ft. was secured by dredging aided by the scour of the current. The jetties are formed of fascine mattresses weighted with stone and capped with rubble and concrete (see JERRY). They have been extended seaward from time to time and in 1927 the east jetty was about 4½ mi. in length from the shore. The west jetty had a length of about 3½ mi. The amount of dredging required to maintain the 35-ft. deep channel through the pass and over the bar has been much reduced since the contraction of the width has been effected. The artificial improvement and simultaneous maintenance of two mouths of a river is a unique experiment. The project was later modified so that the following channel dimensions were prescribed: Southwest pass from Head of Passes to the outer end of the jetties, 40 ft. deep by 800 ft. wide; Southwest pass bar, 40 ft. deep by 600 ft. wide; South pass from Head of Passes to the outer end of the jetties, 30 ft. deep by 450 ft. wide; and South pass bar, 30 ft. deep by 600 ft. wide.

The U.S. congress through the River and Harbor act of Jan. 21, 1927, assigned to the secretary of the army and to the chief of engineers, U.S. army, the duty of making surveys in accordance with house document 308, 79th congress, 1st session, with a view to the formulation of general plans for the most effective improvement of the U.S. navigable streams and their tributaries. The Flood Control act of May 15, 1928, amplified this duty with respect to the tributaries of the Mississippi river. The River and Harbor act of Aug. 30, 1935, authorized the chief of engineers to make supplemental studies as might be warranted. Under these

authorizations and subsequent acts of congress the corps of engineers investigated and reported on practically every river of any importance in the United States. Many of these surveys were published as congressional documents.

IMPROVEMENT OF TIDAL RIVERS FOR NAVIGATION

Whereas the size of tidelless rivers depends wholly on their fresh-water discharge, the condition of tidal rivers is due to the configuration of their outlets, the rise of tide at their mouths, the distance the tide can penetrate inland and the space available for its reception. Accordingly, tidal rivers sometimes, even when possessing a comparatively small fresh-water discharge, have much better natural navigable channels at high tide than the largest deltaic rivers, as shown by a comparison of the Thames, the Humber and the Elbe with the Danube, the Nile and the Mis-

FIG. 6.—RIVER TYNE FROM THE SEA TO WYLAM: LONGITUDINAL SECTION ON THE CENTRE LINE OF THE RIVER SHOWING THE DEEPENING OF THE CHANNEL AND ALTERATION IN WATER LEVELS BETWEEN 1910 AND 1923

issippi. Tidal water is, indeed, unlimited in volume; but, unlike the drainage waters, which must be discharged into the sea, it only flows up rivers where there is a channel and space available for its reception. Consequently, works which exclude the tide from a river may have injurious effects on the channel, as did the sluices which were erected long ago across the fen rivers of eastern Anglia to secure the low-lying lands from the inroads of the sea. The tidal influx is also liable to be reduced by the accretion which may result in an estuary from the construction of training works. The aims of all tidal river improvement should be to facilitate to the utmost the flow of the flood tide up a river, to remove all obstructions from the channel so as to increase the scouring efficiency of the flood and ebb tides, and to reduce to a minimum the period of slack tide when deposit takes place.

Tidal Flow in a River.—The progress of the flood tide up a river and the corresponding ebb are clearly shown by a diagram giving a series of tidal lines obtained from simultaneous observations of the height of the river Hooghly in India during a high spring tide in the dry season. The observations were taken at

FIG. 7.—LONGITUDINAL SECTION OF THE RIVER THAMES FROM WESTMINSTER BRIDGE TO THE NORE

intervals at several stations along the river and the lines exhibit on a very distorted scale the actual water levels of the river at these periods. The steep form assumed by the foremost part of the flood tide lines from the entrance to beyond Chinsura, attaining a maximum in the neighbourhood of Konnagar and Chinsura, indicates the existence of a bore. This is caused by the sandbanks in the channel obstructing the advance of the flood tide, till it has risen sufficiently in height to rush up the river as a steep, breaking wave, overcoming all obstacles and producing a sudden reversal of the flow and abrupt rise of the water level. Such phenomena

are observed on the Severn, the Seine, the Amazon and other rivers. A bore indicates defects in the tidal channel, which can be reduced only by lowering the obstructions and by the regulation of the river. No tidal river of even moderate length is ever completely filled by tidal water; for the tide begins to fall at its mouth before the flood tide has produced high water at the tidal limit. This is clearly shown in the case of a long tidal. Every improvement of the channel, however, expedites and increases the filling of the river, while the volume of water admitted at each tide is further augmented by the additional capacity provided by the greater efflux of the ebb, as indicated by the lowering of the low-water line.

Deepening Tidal Rivers by Dredging.—The improvement of tidal rivers mainly by dredging is specially applicable to small rivers which possess a width sufficient for navigation like the Clyde and the Tyne; for such rivers can be considerably deepened by an amount of dredging which would be quite inadequate for producing a similar increase in depth in a large, wide river, with shifting channels.

Both the Clyde below Glasgow and the Tyne below Newcastle were originally insignificant rivers, almost dry in places at low water of spring tides; and the earliest works on both rivers consisted mainly in regulating their flow and increasing their scour by jetties and training works. They have been improved, since 1840 on the Clyde and 1861 on the Tyne, by continuous systematic dredging. The Clyde has been given a minimum depth of 27 ft. in the channel at low water of spring tides up to Port Glasgow; 25 ft. up to Robb's Dock, and 24 ft. up to Glasgow harbour. A depth of 33 ft. at low water has been provided alongside some of the quays. The Tyne has been progressively deepened (fig. 6) until in 1929 the channel from the sea to the Northumberland dock (34 mi.) had a minimum depth at low-water spring tides of 20 ft. from there to Derwenthaugh, above Newcastle, 25 ft.; and about 12 ft. on to Newburn, the rise of tide at springs increasing these depths by 15 ft.

The minimum low-water depth in the Thames river below Thames Haven in its natural state was about 27 ft. (see HANOVER). A channel at least 30 ft. deep at low-water spring tides now extends from the sea to the King George V dock, 37 mi. above the Nore and Shoeburyness (fig. 7). Shallow portions of the channel between Shoeburyness and Purfleet have been dredged and above Purfleet the river has been considerably deepened in recent years throughout its course to secure this depth. Above the King George V dock the river has been dredged to lesser depths at low water, decreasing to 14 ft. at London bridge.

Regulation and Dredging of Tidal Rivers.—Considerable improvements in the navigable condition of tidal rivers above their outlets or estuaries can often be effected by regulation works aided by dredging, which ease sharp bends, straighten their courses and render their channel depths and flow more uniform. Examples are the Nervion between Bilbao and its mouth, the Weser from Bremen to Bremerhaven at the head of its estuary, and the Whangpoo from Shanghai to Woosung where it enters the Yangtze estuary. These works result in procuring the regulation works on large rivers with only a fresh-water discharge, previously described; but on tidal rivers the main low-water channel should alone be trained with an enlarging width seaward to facilitate the tidal influx, and the tidal capacity of the river above low water should be maintained unimpaired.

To secure a good and fairly uniform depth on a tidal river, it is essential that the flood and ebb tides should follow the same course in order to combine their scouring efficiency and form a single, continuous deep channel. In wide, winding reaches, however, the flood tide in ascending a river follows as direct a course as practicable; and on reaching a bend the main flood-tide current, in being deflected from its straight course, hugs the concave bank, and keeping close alongside the same bank beyond the bend enters into the shoal projecting from the convex bend of the bank higher up, forming a blind shoaling channel as clearly indicated near Brul point in fig. 8. This effect is due to the flood tide losing its gradient and consequently its concentration, at the change of curvature beyond the termination of the concave bank, where it spreads out and passes gradually over, in its direct course, to the next concave bend above along the opposite bank. The

FIG. 9.—LOWER PART OF THE WHANGPOO RIVER (1946). SINCE 1907 THE CHANNEL OF THE RIVER HAS BEEN REGULATED BY BUILDING TRAINING WALLS AND GROYNES

ebb tide, on the contrary, descending the river, follows the general course of the fresh-water discharge in all rivers, its main current keeping close along the concave bank and crossing over opposite Brul point to the next concave bank below. The main currents, accordingly, of the flood and ebb tides in such reaches act quite independently between the banks, forming channels on opposite sides of the river and leaving a central intervening shoal or bar crossing.

In tidal rivers the main ebb current, being reinforced by the fresh-water discharge, generally forms the navigable channel, which is scoured out during floods. Narrowing the river between the bends to bring the two channels together would in certain cases unduly restrict the tidal flow; and, in a river such as the Hooghly, dependent on the tidal flow for the maintenance of its depth for two-thirds of the year, with channels changing with the wet and dry seasons and even shifting their position from day to day, deepening by dredging can never be permanent. Hitherto frequent dredging has been relied on for maintaining the requisite depths at the bar crossings in the Hooghly.

The training and dredging works carried out in the Whangpoo since 1907 have been successful in deepening the alluvial channel of the river to about 30 ft. at low water up to Shanghai including the bar crossing in a wide reach between Gough Island and Woosung where formerly the low-water depth was no more than 73 ft. to 15 ft. The problem which had to be faced differed from that of the Hooghly in that the volume of the land-water runoff is relatively small. Moreover the concave bank of the river above the crossing was being rapidly eroded, accentuating a sharp bend below it. The condition of the lower part of the river is shown in fig. 9.

The erosion of the Taylor's bank, forming the concave side of the main sea channel of the river Messey, which threatened to intensify the bend to a dangerous degree, was countered by the revetting with stone of the concave face of the bank below low water (see HANOVERS).

The average rate of enlargement (of width) adopted for the trained channel of the Nervion, in proportion to its length, is 1 in 75 between Bilbao and its mouth; 1 in 71 for the Weser from Bremen to Bremerhaven; and about 1 in 73 for the Whangpoo from Shanghai to its outlet; and these ratios correspond very nearly to the enlargement of the regulated channel of the Clyde from Glasgow to Dumbarton of 1 in 84, and of the Tyne from Newcastle to its mouth of 1 in 75. Accordingly a divergence comprised between 1 in 70 and 1 in 80 for the regulated or trained channel of the lower portion of a tidal river with a fairly level bed may be expected to give satisfactory results. The divergence as originally laid down for the Seine training works,

FIG. 10.—TRAINING WORKS IN THE SEINE ESTUARY (1946)

1 in 200, was found to be too small. (See fig. 10.) In rivers in which the channels are more or less in natural condition, such as the Thames, the Humber and the Scheldt, the divergence is nearly 1 in 50.

Effect of River Deepening on Tidal Levels.—The general effect of deepening and regulating the tidal section of a river by the removal of obstructions is to facilitate the propagation of the flood tide up the channel and the efflux of the ebb. Consequently such works often result in the lowering of the low-water level and the raising of the high-water level in the upper part of the improved channel and sometimes above it. Thus the deepening of the Tyne river raised the level of mean high-water spring tides at Newcastle about 1 ft. and lowered the water level by 2 ft. at Newcastle quay. In the Tyne river, the highest high water on record since 1880, 4 ft. 3 in. above high-water ordinary spring tide, occurred in Dec. 1921 and again in Feb. 1923. The lowest low water recorded on the Tyne since 1880, 3 ft. 8 in. below low-water ordinary spring tide, occurred March 19,

in a sinuous line curving eastwards and then westwards to the Murray at Corowa, but the lower slopes of the southern tableland—the administrative "South Western Slopes"—is perhaps to be included in the natural Riverina region. Except for these eastern and north-eastern parts, where lie the fairly open upper-middle basins of the Murrumbidgee and Murray systems, the whole area is flat. The fall of the rivers varies from 10 in. per mile in the east to 4-5 in. in the west of the area, and they meander across vast alluvial plains, periodically flooding and forming distributaries and lagoons (anabranches, billabongs) and sometimes even flowing up-stream. Higher up they are stronger, more definite, and more constant in flow and their valleys offer also sites for dams. The soil is preponderantly rich; the climate is generally mild and warm but the summers are hot and dusty and the rain, which falls in winter, is variable. (Av. ann. temp.: 75°-49° F, with extremes: 117°-20° F; av. ann. rainfall: from 12 in. in the north-west to 25 in. in the south-east.) The eastern valleys have yielded considerable quantities of gold, both alluvial and reef, and some alluvial dredging still continues (Adelong and Gundagai districts). In 1915 a deposit of soft black (Permian) sub-bituminous coal was discovered near Oaklands (area: 5 miles by 3 miles, with seams 8 ft. 6 in. to 36 ft.). It is important because of its position near the overland (Sydney-Melbourne) railway line in an otherwise fuelless area of growing population and because of the valuable kaolin deposits which overlie it.

The greater part of the western plains, which normally provide good natural fodder (including salt-bush), is used for sheep grazing, and these are still the home of the large "squatter." But improvements in wheat-growing (seed-selection, dry-farming) have enabled considerable areas to be put to the plough; and by 1922 wheat was being grown as far north-west as Hillston, and, in the south, as far west as Balranald (9-12 in. and 7-8 in. winter, April-Oct., rainfall respectively). The Riverina, indeed, ranks second amongst the wheat-growing districts of New South Wales and has also a relatively high average yield (12.3-17.8 bu. per ac.). Along the south-eastern slopes, with their cooler temperatures and more reliable rain, a good deal of arable farming and dairying is carried on, and fruits, including vines, are grown, the wines of the Albury district having an established reputation. Further west mixed wheat and sheep farming is increasingly practised. But perhaps the greatest potential wealth of the Riverina lies in its irrigation agriculture. The development of this branch is in its infancy but it is already important. Of the total 183,518 ac. under irrigated crops in New South Wales in 1938-39, c. 95,000 were included in the Murrumbidgee and Hay (Riverina) areas. The Murrumbidgee Irrigation area, supplied from the Burinjuck reservoir below Yass, had (1938) nearly 1,400 occupied holdings (17-250 ac. each, average 15-25 ac.) occupying 374,000 ac. of the total projected area (561 sq.mi.). The principal settlements are Leeton, Yanco and Griffith. Fruit (sub-tropical and temperate climate types) is grown, dairying and pig-raising, with butter and cheese making, bacon-curing and fruit-canning carried on largely by cooperative methods. Electricity and water-supplies are provided and education and experimental research are well cared for. In Hay the area is smaller (1926, c. 1,000 ac. occupied for irrigation and 2,000 ac. non-irrigated) and is devoted mainly to dairying and pig-raising. The Murray River development scheme, with the great Hume dam above Albury as head-works, will provide further facilities. The economic and financial aspects of the irrigation projects have presented difficulties and these may still be regarded as expensive if promising experiments. A recent development is rice-growing, the hope being that Australia's needs can be satisfied from this source. Of similar importance is the great Wyangala Dam project, on the upper Lachlan river near Corowa, now (1929) being inaugurated. One million acres will be made available along the Lachlan for wheat growing and mixed (wheat and sheep) farming for 700 families at a cost of about £2,000,000. Though not an irrigation project some irrigation blocks will be provided for fodder (Lucerne, etc.) growing, and the railway from Hillston is now extended to Roto.

The area of the Riverina Administrative Division (see above) is 26,600 sq.mi., its population 84,300 (3.1 per sq.mi.). (Mur-

umbidgee Irrigation area alone: 561 sq.mi.; pop. c. 15,000=27 per sq.mi.). The chief towns are: Albury (q.v., pop. 20,543), Wagga Wagga (11,631), Junee (4,213) and Narrandera in the east, important as business centres for wheat-farming, fruit-growing, and grazing districts and also as railway junctions and river-crossing (bridge) towns with small industries; Leeton, and other irrigation centres with butter, cheese and bacon factories, electricity-supply and machine-repairing works; Jerilderie, Deniliquin, pastoral and agricultural centres with good road or rail connections; Hay, Hillston, Balranald, also pastoral centres (Hay has irrigation settlement also) and both river and rail-head importance. The rivers are still used, when seasons permit, mainly for wool transport, but railway and motor transport are increasingly opening up and serving the "back blocks." Interesting and significant is the way in which the southern borderlands—by agreement between the Victorian and New South Wales Governments—are increasingly tapped by Victorian lines, and, yielding to geographical necessity, are being drawn within the economic sphere (hinterland) of Melbourne.

Production (1938-39): Riverina (administrative division): wool: 41,765,000 lb.; wheat: 8,779,000 bu.; butter: 737,000 lb.; minerals: £28,000; manufactures: £545,000.

RIVER PLATE: see PLATA, RIO DE LA.

RIVER ROUGE, a city of Wayne county, Michigan, U.S.A., on the Detroit and the Rouge rivers, 6 m. S.W. of Detroit; served by the New York Central, Michigan Central, Detroit, Toledo and Ironton, and Detroit and Toledo Shore Line railroads and by lake steamers. Pop. (1930) 20,356 by federal census. The principal industries are shipbuilding, papermaking, blast furnaces and a gypsum products plant. It was incorporated as a village in 1890 and in 1922 was chartered as a city.

RIVERS, ANTHONY WOODVILLE, or WYDEVILLE, 2ND EARL (c. 1442-1483), statesman and patron of literature, and author of the first book printed on English soil, was born probably in 1442. He was the son of Richard de Wydeville and his wife, Jacquette de Luxemburg, duchess of Bedford. His father was raised to the peerage in his son's infancy, and was made earl of Rivers in 1456. Anthony, who was knighted before he became of age, and fought at Towton in 1461, married the daughter of Lord Scales, and became a peer *per se* in 1462, two years after the death of that nobleman. Being lord of the Isle of Wight at the time, he was in 1467 appointed one of the ambassadors to treat with the duke of Burgundy, and he exited his office by challenging Anthony, comte de la Roche, the bastard of Burgundy, to single fight in what was one of the most famous tournaments of the age. (See Bentley's *Excerpta Historica*, 176-182.) In 1469 Anthony was promoted to be Lieutenant of Calais and captain of the king's armada, while holding other honorary posts. His father and brother were beheaded after the battle of Edgecot, and he succeeded in August of that year to the earldom. He accompanied Edward IV. on his campaign in France, and on the continent he was knighted and had a share in the victory of Marston. In 1470 he was created Earl Rivers, and in 1471 he was made a member of the Privy Council. In 1472 he was appointed ambassador to France, and in 1473 he was made a member of the Privy Council.

Caxton's *Book of the City of Manes* is a translation of Teonville's French version of a Latin work, "a glorious fair mirror to all good Christian people." In 1477 Caxton brought out this book, as *Dietes and Sayings of the Philosophers*. (See CAXTON, WILLIAM.) To this succeeded the *Moral Proverbs* of Christine de Pisan, in verse, in 1478, and a *Cordial*, in prose, in 1479. The original productions of Lord Rivers, and, in particular, his *Balades against the Seven Deadly Sins*, are lost.

In 1478 a marriage was arranged between him and Margaret, sister of King James III of Scotland, but it was mysteriously broken off. He was beheaded by order of Richard III at Pontefract on June 25, 1483. His protection and encouragement of Caxton were of inestimable value to English literature, and in

RIVET is a headed pin or bolt used as a permanent fastening in metal work by forming a head on the plain end by the process of hammering or by direct pressure. Cold riveting is practicable for small sizes in copper, brass, aluminum, iron and steel, but the larger sizes have to be heated in the cases of iron and steel, in order to secure rapid and easy closing.

Machine riveting in small sizes is done either in a power press, the ram of which works a snap and closes the tail with a blow, or with a rotary rivet spinning machine, with hard steel rollers which spin the tail quickly and noiselessly into shape. In engineering structures, machine riveting is employed whenever practicable, portable pneumatic hammers, or fixed or portable hydraulic riveters being used.

The various shapes of rivet heads or tails include the countersunk, beaten flush into a conical recess in the plate, the cup or round head, the pan head, which has sloping sides and flat top, the conical with sloped sides ending in a point, and the thin flat head coopers' or timbers' rivets. Bifurcated rivets for belting and harness have thin heads, but the tails are split, and opened like a paper fastener. A great deal of gas or electric welding is now substituted for riveting in the case of hollowware and other sorts of sheet metal product. Electric welding is an alternate method for the connection of structural members such as columns and beams in building construction.

(See also **BOILER-MAKING AND PNEUMATIC TOOLS**.)

RIVIERA, the narrow coast-land between the mountains and the sea around the Gulf of Genoa in the north of Italy and in France from Nice on the west to Spezia on the east. The name is derived from *riva* (Lat. *ripa*) meaning bank. It is usually spoken of as Riviera di Ponente ("the coast of the setting sun," the portion between Nice and Genoa), and as Riviera di Levante ("the coast of the rising sun," the portion from Genoa to Spezia). All this district, being open to the south and sheltered from the north and east winds, enjoys a remarkably mild climate (winter mean, about 49° F.); the vegetation in many places partakes of a subtropical character (e.g., the pomegranate, agave, prickly pear, date, palm and banana). Large numbers of flowers, especially roses, violets, hyacinths, etc., are grown near Nice, Mentone, Bordighera and other towns, for the London and Paris markets. The uncommon mildness of the climate, conjoined with the natural beauty of the coast scenery—the steep sea-crags, the ruined towers and the range of the Maritime alps—attracts thousands of invalids and convalescents to spend the winter there, and these resorts are frequented for sea-bathing in summer. Proceeding from west to east, the following are the places to which visitors principally resort: Nice, Monaco (an independent principality), Monte Carlo, Mentone (the last town on the French Riviera), Bordighera, Ospedaletti, San Remo, Alassio, Nervi, Santa Margherita, Rapallo, Sestri Levante, Levanto. The railway which runs close through the Riviera burrows through the many projecting headlands by means of more than 80 tunnels.

RIVIERE, BRITON (1840-1920), English artist, was born in London on Aug. 14, 1840. He was educated at Cheltenham and Oxford, and received his art training from his father, an art master. His first pictures appeared at the British Institution, and in 1857 he sent three works to the Royal Academy, becoming from 1863 a regular exhibitor. He contributed illustrations to *Punch* and other journals. He died on April 20, 1920.

RIVIÈRE-DU-LOUP, formerly Fraserville, a city and watering place in Temiscouata county, Quebec, Canada, 70 mi. (by water) N.E. of Quebec, on the St. Lawrence river, and at the mouth of the Rivière-du-Loup, on the Canadian National railways. Flour, leather, doors and furniture are produced. Pop. (1951) 9,425.

CONVENTIONAL SIGNS FOR RIVETING SHOWING HOW THE DRAFTSMAN DRAWS RIVETS IN PLAN AND ELEVATION ON ALL STRUCTURAL DRAWINGS

RIVINGTON, CHARLES (1688-1742), British publisher, was born at Chesterfield, Derbyshire, in 1688. He was apprenticed to a bookseller in London, and in 1711 took over the business of Richard Chiswell (1639-1711), at the sign of the Bible and the Crown in Paternoster row. His business was almost entirely theological and educational; he published one of Whitefield's earliest works, and brought out an edition of the *Imitation of Christ*.

In 1736 Rivington founded the company of booksellers called the "New Conger," in rivalry with the "Conger" which dated from about 1700. The business was handed down through the family until 1890, when it was sold to Messrs. Longmans. A business of the same character was carried on by Septimus Rivington (1846-1926) and J. G. Percival, as Percival and Co. (1889-93), and in 1897 the title of Rivington and Co. was revived.

See S. Rivington, *The House of Rivington* (1894); also *The Publishers' Circular* (Jan. 15, 1885 and June 2, 1890).

RIVINGTON, CHARLES ROBERT (1846-1928), English solicitor, was born on Dec. 7, 1846, and educated at King's college, London. He entered the old family firm of Rivington and Sons in 1869, and for 47 years held the post of clerk to the Stationers' company.

He wrote the *Records of the Stationers' Company*. He died at Appleby, on Aug. 22, 1928.

RIVINGTON'S GAZETTE (1773-1783), an American colonial newspaper was founded in 1773 by James Rivington, the sixth son of Charles Rivington (q.v.), a British publisher.

James Rivington, who had emigrated to the colonies in 1760 and became a bookseller in Philadelphia, New York, Boston and again in New York called his journal *Rivington's New-York Gazetteer, or the Connecticut, New Jersey, Hudson's River, and Quebec Weekly Advertiser*; he declared that his aim was "never to admit any performance, calculated to injure Virtue, Religion or other public Happiness . . . or to raise a Blush in the face of Virgin Innocence." The paper was soon distributed in several colonies.

Rivington was opposed by the Sons of Liberty (q.v.), who in Nov. 1775 destroyed his printing plant. In 1777, however, he began to publish his paper again, having been appointed the king's printer in New York. Now an open Loyalist organ, it was published under various names until Dec. 31, 1783.

Rivington, who allegedly had secretly aided George Washington, remained in the United States after the war.

He never published a newspaper again although he continued as a bookseller.

See Isaiah Thomas, *The History of Printing in America*, 2 vol. (1874); H. R. Plomer et al., *A Dictionary of the Printers and Booksellers . . . 1720 to 1775* (1932).

RIVOLI VERONESE, a village of Venetia, Italy, in Verona, on the Adige, 13 mi. N.W. of Verona. Pop. (1936) 356 (town), 1,586 (commune).

Rivoli Veronese was the scene of the battle in which, on Jan. 14, 1797, Napoleon defeated the Austrians commanded by Josef Alvinczi, Baron von Barberek (1735-1810). (See **FRENCH REVOLUTIONARY WARS**.)

A famous street in Paris (rue de Rivoli) commemorates the victory, and under the empire Marshal Masséna received the title of duke of Rivoli.

The Battle of Rivoli.—This battle, fought on Jan. 14, 1797, was the climax of the repeated Austrian efforts to relieve the vital fortress of Mantua, which blocked Napoleon's advance toward Vienna. Napoleon's victory cleared the way for his advance into Austria.

RIXDORF, a suburb of Berlin, Germany. Rixdorf was a foundation of Moravian Brethren from Bohemia, who settled there in 1737. German Rixdorf was a much more ancient place, and appears as Richardsdorf in 1630 and as Riegenstorp in 1435. Before 1435 it belonged to the order of the Knights of St. John.

RIYADH, or **RIYAD**, a city of Nejd, Saudi Arabia, 480 mi. N.E. of Mecca. The population was estimated at 60,000 in 1951. The city is the capital of Nejd and, with Mecca, of Saudi Arabia.

The city is situated on an oasis in a hollow of the great plateau and is surrounded on all sides, except the northeast, by palm groves. The actual site is on limestone rock, forming a well marked mound on the crest of which is the royal palace. The settlement is encircled by a thick wall about 25 ft. high, pierced by many gates. The Thumairi gate on the east is the entry from the desert tracks to the north and east and south, while the Dhuhairi gate gives access to the northwestern route to Washm and the roads to Mecca. Riyadh is thus a great desert focus.

Within the walls irregular streets converge upon a central square. In the open space north of the royal palace is the market place. The great Mosque is a rectangular building about 60 by 50 yards. Architecturally it reflects the severity of the puritan Wahhabis.

In addition to the great Mosque there are a number of smaller ones. To the north of the main thoroughfare, about half way between the palace and the Thumairi gate, is the great fort built in the form of a square, but it is the royal palace that commands the whole city, and in its simplicity represents "all that is best in modern Arabian architecture." Outside the city walls stands the royal palace al-Murabba' (square) with its electric lights, telephones and elevator. The water supply of the city comes from numerous wells among the palm groves without the city, and beneath the shades of these groves there tend to grow up suburban residential quarters.

In 1951 a railway connecting Riyadh with the town of Dhahran was completed.

See H. St. J. B. Philby, *The Heart of Arabia*, vol. 1.

RIZA SHAH PAHLAVI (1877-1944), shah of Persia (Iran) from 1925 to 1941, was born in Mazandaran, the son of an army officer.

Entering the army at an early age, he showed such aptitude that promotion was rapid, and he rose at length to the command of the Cossack division. In 1921, in conjunction with Zia ad-Din, he marched on Tehran with about 4,000 men and compelled the government to resign. Zia became prime minister, while Riza Khan (as he was then known) took over the ministry of war and the command of the army. In 1923 he became prime minister and virtual ruler. Two years later, after Ahmad Shah Qajar had left the country, Riza Khan was made shah and the sovereignty was vested in the Pahlavi dynasty. Riza Shah proceeded to carry out reforms on western lines, largely on the model of Kemal Atatürk in Turkey.

He broke the power of the tribes, put down brigandage and restored the authority of the central government. His greatest achievement was the construction of the Trans-Persian railway, which was completed in 1938.

Riza Shah had employed many Germans in the industrialization of his country; and when, in Aug. 1941, he rejected a joint request by Britain and the U.S.S.R. for the expulsion of these Germans, the two powers sent troops into Iran to prevent Germany from seizing control. Riza Shah thereupon abdicated in favour of his son, Mohammed Riza Pahlavi, and was sent first to Mauritius and

then to South Africa. He died in Johannesburg on July 26, 1944. (L. Lo.)

RIZZIO or **RICCIO**, **DAVID** (c. 1533-1566), secretary of Mary (q.v.), queen of Scots, was a native of Turin, and came to Scotland in 1561 in the train of the Piedmontese ambassador. The queen wanted a bass singer, and he entered her service as a musician, becoming also her *valet de chambre*, and in 1564 private foreign secretary. After her marriage to Darnley in 1565 his influence with Mary became paramount. His elevation aroused the active hostility of Darnley and the other nobles, and he was suspected of being the queen's lover. On the evening of March 9, 1566, the earls of Morton and Lindsay, with armed followers, entered Mary's supper chamber at Holyrood, seized Rizzio, hacked him to death with daggers, and threw his body into the courtyard.

See Ruthven's *Narrative of Riccio's Murder* (1836); and the article on **MARY, QUEEN OF SCOTS**.

ROACH, JOHN (1813-1887), U.S. shipbuilder, has been called "the father of iron shipbuilding in America." Born in County Cork, Ire., on Dec. 25, 1813, the son of Patrick Roche, he emigrated to the United States at an early age.

He worked at the Howell Iron works in Howell, N.J., where he was taught the trade of iron moulding. After a short stay in Illinois, where he had travelled in 1840 to purchase land, he returned to the east and, with other artisans, established an iron works in New York city. Roach, who had become the owner of the plant, later suffered severe financial reverses when a boiler exploded, the works being extensively damaged. He managed to rebuild his plant, however, and his firm became by the mid-1860s one of the leading foundries in the country.

A manufacturer of marine engines, he acquired a number of marine-engine plants and in 1868 the Morgan Iron works in New York city. After purchasing shipyards in Chester, Pa., he built many iron ships for the government and private companies.

Although he was not the first to build such ships, he became known as "the father of iron shipbuilding in America" since he was a leading authority and builder. He also was a vigorous advocate of a strong U.S. merchant marine.

Ships he built for the federal government, with which he co-operated in developing new types of marine power plants, such as the compound engine, included the "Alert" and "Huron," sloops of war, and the "Miantonomoh" and "Puritan," monitors.

He voluntarily closed his works in 1885 when the secretary of the navy, overruling the Naval Advisory board, rejected the "Dolphin," a dispatch boat built by Roach, and also cancelled Roach's contract to build for the navy three cruisers—the "Atlanta," "Boston" and "Chicago"; construction of the cruisers had begun in 1883.

Although an adjustment was later made, Roach retired from the business and died on Jan. 10, 1887, at New York city.

See Henry Hall, "Ship-Building Industry in the U.S.," *Census Reports*, 10th Census, vol. viii (1884).

ROACH (*Rutilus rutilus*), a cyprinid fish of England, Europe and Siberia. It is a moderately deep, silvery fish. Specimens of more than 3 lb. are rare.

Although the roach provides excellent sport for the angler, it is not esteemed for the table.

In the United States the term has been applied to various members of the carp family, and the "golden shiner" minnow has been sometimes called a roach.

ROAD-RUNNER (*Geococcyx californianus*), a bird characteristic of the deserts of northwest South America, Mexico and southern U.S.A. It runs with head lowered and tail horizontal, stopping from time to time, when the tail assumes an almost vertical position. It belongs to the cuckoo family (*Cuculidae*).

ROADS AND STREETS. In current usage "road" is applied as a general term for all broad made ways from place to place, whether with separate side-paths for foot-passengers or not, while "street" is confined to the roads through towns, villages and other inhabited places, more or less lined by houses and other buildings on either side. The present article is confined to the methods adopted in making roads, from the first great road-makers, the Romans, down to modern times. The roadways of times anterior to the Romans, at least in Europe, were merely the tracks worn by the feet of pedestrians and animals, and the wheels of vehicular traffic.

Roman Roads.—The earliest roads about which anything definite is known, so far as construction is concerned, are those of ancient Rome, one of the oldest of which and the most celebrated for the grandeur of its works—the Appian Way—was commenced in 312 B.C. Roman roads are remarkable for preserving a straight course from point to point regardless of obstacles which might have been easily avoided. They appear to have been often laid out in a line with some prominent landmark, and their general straightness is perhaps due to convenience in setting them out. In solidity of construction they have never been excelled, and many of them still remain, often forming the foundation of a more modern road, and in some instances constituting the road surface now used. In England many lengths of Roman road which had fallen into disuse have been re-opened and modernized since 1910. It is customary, with the help of allusions of ancient writers, to follow the ideal mode of construction, though this was not always adopted. Two parallel trenches were first cut to mark the breadth of the road; loose earth was removed until a solid foundation was reached; and it was replaced by proper material consolidated by ramming, or other means were taken to form a solid foundation for the body of the road. This appears often to have been composed of four layers, generally of local materials, though sometimes they were brought from considerable distances. The lowest layer consisted of two or three courses of flat stones, or, when these were not obtainable, of other stones, generally laid in mortar; the second layer was composed of rubble masonry of smaller stones, or a coarse concrete; the third of a finer concrete, on which was laid a pavement of polygonal blocks of hard stone jointed with the greatest nicety. The four layers are found to be often 3 ft. or more in thickness, but the lower ones were dispensed with on rock, on which the paving stones were sometimes laid almost directly. The paved part of a great road appears to have been about 14 ft. wide, and on either side, and separated from it by raised stone edgings, were unpaved sideways, each of half the width of the paved road. Where, as on many roads, the surface was not paved, it was made of hard concrete, or pebbles or flints set in mortar. Sometimes clay and marl were used instead of mortar, and it would seem that where inferior materials were used the road was made higher above the ground and rounder in cross section. Streets were paved with large polygonal blocks laid as above described, and footways with rectangular slabs. Specimens are still to be seen in Rome and Pompeii, while in Britain many of the roads were of hard gravel or had a cobbled surface. There are no traces of Roman influence in the later roads in England, but in France the Roman method appears to have been followed to some extent when new roads were constructed about the beginning of the 18th century. A foundation of stones on the flat was laid, and over that two layers of considerable thickness, of larger and smaller stones, bordered by large stones on edge, which appeared on the surface of the road. A French *chaussée* with *accotements* still retains some resemblance to the old Roman roads.

English Roads, 18th Century.—The almost incredibly bad state of the roads in England towards the latter part of the 17th century appears from the accounts cited by Macaulay (*Hist.* c. iii.). It was due chiefly to the state of the law, which compelled each parish to maintain its own roads by statute labour, but the establishment of turnpike trusts and the maintenance of roads by tolls do not appear to have effected any great improvement. At the time of Arthur Young's six months' tour in 1770 the roads

would seem to have been almost as bad as ever, and it is doubtful if there was much improvement up to the beginning of the 19th century. The turnpike roads were generally managed by ignorant and incompetent men until Telford and McAdam brought scientific principles and regular system to their construction and repair. The name of Telford is associated with a pitched foundation, which he did not always use, but which closely resembled that which had been long in use in France, and the name of McAdam often characterizes roads on which all his precepts are disregarded. Both insisted on thorough drainage and on the use of carefully prepared materials, and adopted a uniform cross section of moderate curvature instead of the exaggerated roundness given before; but, while Telford paid particular attention to a foundation for the broken stone, McAdam disregarded it, contending that the subsoil, however bad, would carry any weight if made dry by drainage and kept dry by an impervious covering. McAdam was engaged more with the repair of old roads than with the construction of new ones, and, though it is not possible to agree with all his doctrines, the improvement which he effected in road management and maintenance was great and lasting. When McAdam died in 1836 the turnpike system had attained its widest extension, no less than 1,100 trusts being then in existence. The dawn of the railway era brought disaster to the turnpike trusts, and roads suffered a long period of neglect at the hands of the parochial authorities who were mainly responsible for their upkeep.

The Public Health Acts of 1848 and 1875 and the Local Government Acts of 1888 and 1894 set up, stage by stage, the system of road-administration which now prevails in Great Britain,—the responsibility for main roads resting generally upon county councils, while less important roads are in the hands of urban district councils and rural district councils. The Development and Road Improvement Funds Act (1909) established the road board, now merged in the Ministry of Transport, which makes grants from the Government's road fund towards the expenses incurred by the highway authorities just named.

Construction of Roads.—The progressive transfer of traffic from railways to roads during the first quarter of the 20th century and the increase in the volume of road traffic and in the consequent strain upon the road surface impel the road engineer to seek more and more permanent and impervious materials which will avoid the vexatious process of frequent renewal.

Incidentally, an impervious surface will prevent the deterioration of the foundation and will enable the camber or crown of the carriage way to be reduced, thereby adding to the safety and convenience of drivers. Cambers of 1 in 24, and even steeper, used to be common. In modern practice this has been reduced to 1 in 48. In the design of new highways sufficient land is frequently acquired to enable all pipes, mains and conduits to be laid under the verges, shoulders or margins, so that the carriage-way itself may not be subject to future disturbance. Dimensions of 100 ft. or 120 ft. between fences are becoming common in England, while in the United States even more generous figures are adopted. In England it has become common to adopt a 10 ft. factor for the width of carriageways, e.g., for three streams of traffic a 30-ft. carriageway would be provided, for four streams 40 ft.

The wide road allows space for tree planting and keeps noise and vibration at a tolerable distance from the householder's windows. Spacious footways and verges on each side of a carriageway extend the motorist's view as he rounds a curve and promote the safety of vehicles entering from side roads. Drivers gain a wider range of vision on each side and secure an extra fraction of a second for deliberation before venturing into the main stream of traffic.

Sharp bends and abrupt changes of direction are now discountenanced in favour of easy curves of long radius. Where, owing to the configuration of the ground, curves of less radius than 1,000 ft. are unavoidable the outer edge of the carriageway is super-elevated or "banked," following the invariable practice

'The British refer to cambers in this way; in the United States they are referred to as $\frac{1}{2}$ in. to 1 ft. or $\frac{1}{4}$ in. to 1 ft. (Ed. E.B.)

BY COURTESY OF (1, 2) THE J. I. CASE TRACTOR COMPANY, (3) THE CATERPILLAR TRACTOR COMPANY, (4, 5, 6, 7) THE LAYMOND ENGINEERING COMPANY

ROAD BUILDING MACHINERY AT WORK ON GRADING AND SURFACING OF ROADS

1. Grader (right background) with tractor, 2. "Building" dirt over a metal culvert, 3. Blumhouse paving machine for previously prepared base, 4. Subgrade roller, 5. "Grading" machine used for surfacing a concrete road, 6. "Final bridge" in use where center joint on road is being closed, 7. Road paver with tractor, 8. Finishing machine on a concrete road

of railway engineers. The width of the carriageway should be increased at such points. Steep gradients which disfigure the rigidly straight Roman roads are avoided by moulding the line to the contours of the hillside. In laying out new arterial roads of which upwards of 200 miles have been built in the neighbourhood of London since the year 1920, it has almost invariably been found possible to limit the gradients to 1 in 30. Gradients of excessive flatness (less than 1 in 300) are to be avoided, owing to the difficulty of effectively draining the surface.

The elimination of level crossings over railways is an important item in the programme of modern road-improvements, and the time is fast approaching when, in the interest of public safety bridges may have to be provided at points where important highways cross one another.

Single and Duplicate Carriageways.—In designing new arterial roads, varying opinions prevail as to the relative advantages and disadvantages, on the one hand, of a single wide carriageway, or, on the other hand, of duplicate carriageways for up and down traffic respectively. While the single carriageway 50 ft. wide will probably carry a greater volume of traffic in the year than two 30 ft. carriageways each reserved for one-way traffic, the separate tracks will conduce to the safety of the driver and to that of the pedestrian who, in crossing each carriageway, knows from which direction the traffic will be approaching him.

Again the duplicate carriageway lends itself to progressive development. In the first instance, while the country alongside the road remains open, a single carriageway can be formed and will meet travellers' needs until such time as population and traffic increase, when the second carriageway can be constructed without interfering with the road which is already in use. The general tendency of road practice to assimilate railway methods, encourages the view that separate carriageways (up and down lines) are likely to prevail in the case of new arterial roads.

In the older and more settled countries where a tolerably complete network of old highways already exists, the road engineer's task is usually confined to the improvement of these, rather than to the construction of entirely new communications. Due to the steady increase in funds available through taxation it became possible to launch in Great Britain in 1925 the so-called "trunk road programme" for the systematic transformation of the most important through routes of the country. The expenditure incurred or approved for this purpose had reached by March 1928 a total of about £6,500,000. In their unimproved state these roads usually possess a carriageway varying from 14 ft. to 24 ft. in width, with little, if any, footway. Generally speaking, where improvement is now undertaken, sufficient land is being acquired to allow a dimension of 60 ft. between fences. This affords space for a carriageway 30 ft. wide, two 8 ft. footways and two 7 ft. verges. In more rural areas the carriageway is limited for the present to 20 ft., only one footway is constructed, and the verges are widened to absorb the additional space.

Plank and Log Roads.—In opening up a new country, roads, temporary or permanent, must be made with such materials as may happen to be at hand. The plank road often used in American forests makes an excellent track for all kinds of traffic. Upon that side of the space devoted to the road, which the heavy traffic leading to a town will use, two parallel rows of sills are laid longitudinally flatwise, the earth being well packed and rammed to the level of their faces. The joints are not opposite; a short piece of sill is put either under or by the side of each joint. Cross-boards are laid down loosely, so that groups of four boards together will project on alternate sides of the road forming a shoulder to enable vehicles to get on to the track at any point. The remainder of the road space is formed as an earthen track, for light vehicles. Its slope outwards may be 1 in 16, that of the plank road 1 in 32. If the soil is too bad for the earthen track, short lengths of plank road of double width are made at intervals to form passing places. The cross boards are spiked down on five sills, and are sprung so as to give a fall both ways.

The log road is formed across swamps by laying young trees of similar length close together. This is ridiculed as a "corduroy" road, but it is better than the swamp. Good temporary roads may

be made by laying down half logs roughly squared upon the ground, close together or with spaces between of a couple of inches, into which earth is well rammed.

The mode of carrying a road across a bog upon a foundation of faggots or brushwood is well known. In India the native roads have been made equal to heavy traffic by laying branches of the mimosa across the track. And in the great plains, where the soil, when dry, would otherwise lie deep in dust, this is entirely prevented by laying across the track a coarse reed or grass like the pampas-grass, and covering it with 3 or 4 in. of loam.

THE MAKING OF CITY STREETS

In the principal streets of the world's great cities where highly durable paving materials on a concrete foundation have long been in use—mastic asphalt, compressed asphalt, wood blocks, granite sets, etc.—recent changes of method are mainly confined to the strengthening of the concrete foundation by an increase in thickness or the introduction of metal reinforcement. In some areas in London it is now the practice to lay as a foundation for wood blocks a bed of cement-concrete as much as 12 in. thick, containing a steel reinforcing fabric. Intolerance of traffic interruptions encourages the introduction of time-saving devices. Growing use is made in the busiest thoroughfares of quick-setting cements, such as *ciment fondu* and ferrocrete, which reduce by a fortnight or more the period which must elapse before the road can be opened to traffic. Various experiments have been tried in the use of rubber as a paving material; in some instances it has taken the form of a wearing cap applied to a block of wood or other material; in other instances the entire block is composed of rubber. The elasticity of the material renders it somewhat liable to displacement under the stress of traffic.

Foundations.—The choice of materials for foundations is usually dictated by considerations of transport, though in certain favoured districts the hard, compact subsoil of chalk or rock needs but little improvement. On a firm stratum of chalk a well-compressed layer of clinker will often serve to carry the surfacing coat. Equally serviceable as a natural foundation is a well-drained bed of coarse gravel; finer gravels, and even so fine a material as sand, are not to be despised, provided that the latter has no opportunity of escaping laterally under pressure. In France a thick bed of river sand is not infrequently used as the foundation for sett paving. The bearing capacity of clay, loam and other similar subsoils is so diminished by the presence of water that great care must be taken to ensure adequate drainage before road-making operations are begun. The want of uniformity and reliability in the chance supplies of materials formerly used as "hardcore" foundation for new roads in areas devoid of quarries has led to a notable extension in the use of cement concrete as a road foundation. Hardcore derived from demolished buildings consists of ingredients possessing every degree of durability from broken fragments of plaster to the hardest vitrified bricks. These heterogeneous materials thrown down pell-mell in a layer 12 in. thick and subsequently crushed under a 10-ton steam roller form the foundation of most of the roads on outskirts of great cities, and it is not surprising that carriageways so constructed show obvious signs of weakness under the stress of modern traffic.

Surfacing Methods.—Water-bound macadam (composed of broken granite, trap or hard limestone) still remains in use on lightly trafficked roads, but as it does not possess impervious qualities it is usually treated with hot surface dressings such as tar or various bituminous mixtures, applied in warm, sunny weather to a thoroughly swept, dry carriageway, the surface of which is then "gritted" with chippings or shingle. As surface dressings, various asphaltic or bituminous emulsions are applied cold, regardless of weather. Tar is used as a surface dressing and as a "binder" for mixing with materials prior to their application so as to give cohesive qualities to the entire thickness of the road crust. By this means such materials as limestone and slag can be utilised, which are not so well adapted to waterbound methods.

Natural asphalts after a 70 years' test still remain in high favour for the paving of streets in wealthy cities. During the twelve years 1916-1928, however, much research has been devoted

to the problem of utilizing the valuable properties of asphalts and bitumens in some cheaper form of pavement suitable for wider adoption. Asphaltic and bituminous mixtures are now utilized as a matrix to bind together an aggregate of broken stone or clinker, applied in one or two coats as a road-surfacing material.

In this category fall the processes known as bituminous macadam, grouted macadam, single-coat bituminous carpet, bituminous sand-carpet on a bituminous sub-crust, bituminous clinker carpet on a bituminous sub-crust. In many cases these surfacing materials are laid upon the old macadam road-crust suitably regulated, but where this does not afford sufficient strength a concrete foundation is formed. In all these bituminous surfacing methods, the need for securing the greatest possible compactness by the elimination of voids is achieved by elaborate precautions in grading the materials. It is necessary to determine experimentally the exact proportions of ingredients of varying-grades needed to attain the highest degree of density in the resultant mixture.

Cement-concrete, after gaining a wide vogue in Canada and the United States, is now extending its sphere of use in Great Britain as a running surface for carriageways. Its use as a foundation for asphalt or wood blocks has long been an established practice. Special interest attaches to the application of concrete in view of the wide range of materials utilisable as aggregate, as compared with the very uneven geographical distribution of good road-stone supplies. On the other hand, concrete is somewhat handicapped by the lengthy period of setting and "curing," which is requisite before the new surface can be subjected to the strain of traffic. This difficulty may be mitigated in future by the use of quick-setting cements, several types of which (*ciment fondus*, ferrocrete and other aluminous cements) are now available.

Standardisation.—Standard specifications and practice have been proposed for the construction of concrete pavements. These are of three principal types. The first is for a single-course work, the second for a two-course work, the third for a three-course work. The first two types are for the full thickness, while the third is for a layer of concrete placed in varying proportions. One-course work is suitable for the lightest class of traffic, the two-course work for the medium class, and the three-course work for the heaviest class.

Methods of Laying.—In the usual process of laying the concrete, the surface is first prepared by the removal of the old surface, and the new surface is then laid in layers of uniform thickness, and is finished by the usual means. The old surface would be filled first, separated by gaps between the even numbers; these gaps would not be filled until the odd numbers had completely set, thus counteracting the effects of expansion and contraction. The transverse joints separating the slabs are sometimes disposed at right angles across the road; in other instances they lie at an angle of 60° or so to the kerb-line, so that the impact of the wheels of the vehicle does not strike any slab simultaneously.

The aggregate, consisting of crushed stone or gravel, should be clean and well graded in size, so as to reduce the percentage of voids to a minimum. Risks of failure in the concrete are greatly reduced by washing the aggregate. The proportions commonly adopted vary from 1 cement, 2½ sand and 3 gravel to 1 cement, 2 sand and 4 gravel. Only a bare sufficiency of water should be added—a very wet mixture encourages voids. Mechanical mixing plant is generally adopted.

The precautions to be taken during the setting of the concrete depend largely on the climatic conditions. In moist weather no harm will arise from leaving the green concrete uncovered for a few hours, but in hot sunny weather exposure will lead to the formation of hair cracks. Heavy canvas is often used for protecting the concrete during the first 24 hours of setting. The canvas is then removed, and a layer of earth spread over the surface about 2 in. thick and left there for a fortnight or so. For the purpose of indurating the surface of the cement concrete, recourse is sometimes had to two or three applications of a weak solution of silicate of soda.

In London several interesting experiments are being tried

(1929) in the use of rubber as a paving material for carriageways, but the high cost appears likely to hinder any general adoption of this method.

Reinforcement.—Where anxiety is felt as to the soundness of the subsoil on which concrete is laid, and it is accordingly desired to form a slab qualified to serve as a raft or bridge, one or two layers of metal reinforcement are often introduced into the concrete. In other cases reinforcement is adopted owing to the fact that the thickness of the concrete has had for various reasons to be reduced.

There are large numbers of fabrics in use, expanded metal of 6 in. and other meshes, woven wire, mesh fabrics in which the main tension wires of drawn mild steel run longitudinally with cross-wires welded thereto at regular intervals; other systems make use of twisted or vertical bars; double reinforcement is frequently used in "mattress" form, the upper and lower layers being connected by diagonal members. The weight of reinforcement varies in ordinary practice from 5 lb. to 25 lb. per yard superficial of concrete foundation.

Traffic problems (*see* TRAFFIC AND TRAFFIC REGULATION and various articles under the heading of TRANSPORT) have created many new problems in road construction. These developments have necessitated the elimination to a great extent of narrow bridges and under passes, sharp curves, blind intersections and crossings.

(C. H. Bx.)

ROADS AND ROAD CONSTRUCTION IN THE UNITED STATES

There are at present approximately 3,000,000 miles of public rural roads in the United States. Of these approximately 1,150,000 miles are surfaced and a large mileage graded and drained according to good engineering standards. Of the surfaced mileage about 50% is improved with low-cost surfaces such as gravel, sand, gravel and crushed stone, and 50% is improved with high-cost surfaces such as bituminous pavement or concrete. The Federal Road Construction Administration is the agency for the construction of Federal roads, and it is the policy of the Department of Agriculture to encourage the improvement of the rural roads of the United States by the Federal Government. The Federal Road Construction Administration is the agency for the construction of Federal roads, and it is the policy of the Department of Agriculture to encourage the improvement of the rural roads of the United States by the Federal Government.

The plan of construction of roads is divided into three main classes.—Federal roads, constructed with Federal funds and State funds under supervision of the State highway department and the Federal Public Roads Administration; State roads, built with State funds under the supervision of the State highway departments; county and local roads constructed largely with county and local funds by county and local authorities.

In the Federal-aid system there are 227,000 miles of road that are almost all surfaced, but the system is not yet complete. Many sections, built for a lesser and slower moving traffic, are in need of widening, straightening, resurfacing, and other improvements.

The Federal-aid Highway System.—The Federal-aid highway system was designated co-operatively by the Secretary of Agriculture, acting through the Bureau of Public Roads, and the officials of the several State highway departments, in accordance with the Federal highway act passed by Congress, 1921. The system thus designated comprises the main interstate roads, and reaches directly nearly every city of 5,000 population or greater, and the roads are so chosen that if a zone 10 miles wide were marked off on each side of them, these zones would include the homes of 90% of the population. (*See* HIGHWAY.)

For improvement of the Federal-aid system special appropriations have been made by Congress for each fiscal year since 1917, with exception of the years 1933 and 1934. These funds are required generally to be matched by the States in at least equal amount. Formerly limited to \$10,000 per mile and to expenditure on roads outside of cities, the Federal funds may now be expended without arbitrary limitation per mile and upon sections of the Federal aid system within as well as without city limits. The Fed-

eral funds are appropriated from any funds in the U. S. Treasury, there being no special Federal tax for road construction. In addition to improvements financed with joint Federal and State contributions, other improvements are made on the Federal-aid system but with State funds exclusively, and the mileage improved in this way to date approximates that improved with Federal participation.

In addition to its contribution to Federal-aid roads, the Federal Government has also assumed as a rightful obligation the

duty of building those sections of the major national system which lie in the national forests and parks and other parts of the public domain. In the forest highway system are 21,980 miles of road, of which 6,832 miles have been improved.

During the period of the depression large additional Federal appropriations have been made for the purpose of promoting road construction as a measure for the relief of unemployment. These appropriations have been expendable upon secondary and upon feeder roads as well as upon routes of the Federal-aid system, and represent the first departure by the Federal Government from the long established policy of participating exclusively in the improvement of main interstate highways. Special funds have also been provided for elimination of highway-railroad grade crossings. These appropriations, unlike the earlier Federal grants, have not been matched with State funds.

Improvement of secondary or farm-to-market roads and elimination of highway-railroad grade crossings are being continued as parts of the Federal-aid program. The Federal Government generally pays half the cost of the highway work and the full cost of grade-crossing elimination.

State Highway Systems.—There are approximately 340,160 miles of roads in the 48 rural primary State highway systems. These systems include, in most States, all the roads of the Federal-aid system and a number of others of important State significance. In some States the selected roads have been designated by name and description in the laws of the State, in others the designation has been left to the State highway departments.

State highway systems are constructed with State funds only and with State and county or other local funds.

Of the total State highway mileage, in 1936, there were 289,103 miles surfaced. Of the surfaced mileage, 17,364 miles are of sand-clay and top soil; 103,958 miles are of gravel, chert, and shale (treated and untreated); 33,805 miles are low-cost bituminous mix; 20,281 miles are waterbound macadam (treated and untreated); 14,232 miles are of bituminous macadam by penetration; 15,100 miles are of sheet asphalt, and bituminous concrete; 81,283 miles are Portland cement concrete; 2,812 miles are of vitrified brick; 268 miles are of asphalt block, wood block, stone block, and miscellaneous types.

Of the unsurfaced mileage, amounting to 51,057 miles, 33,250 miles are unimproved or only partly graded, and 18,537 miles are improved to established grade and drained.

County and Local Roads.—There are approximately 2,660,000 miles of county and local rural roads in the county and local road systems. All roads not included in the Federal-aid and State highway systems are classified as county and local rural roads. With the exception of 177,504 miles transferred for administration as secondary roads by the State highway departments of 14 States, all local roads are built by local officials with local funds.

By far the larger part of the unimproved mileage of the country is in the county and local road system. There are hundreds of thousands of miles on which the traffic is so small that improvement is not justified. Of the local road mileage approximately

860,900 miles have been surfaced; in large part these surfaces are of such low types as sand-clay, topsoil, gravel, and water-bound macadam. In recent years great improvements have been made in methods of combining asphalt and tar with materials of a sandy or gravelly nature to make low-cost dustless surfaces. Such surfaces are particularly suited to secondary roads and a considerable mileage has been constructed.

Administration of Federal-aid Road Construction.—Federal-aid roads are constructed under the immediate supervision of the several State highway departments subject to the approval of the Federal Works Administrator, who has delegated the details of administration to the Public Roads Administration. The administration has established 12 districts, each in charge of a district engineer who co-operates directly with the State highway engineers of the States included in his district. The four western districts are under the general supervision of a chief, with headquarters at San Francisco, who is responsible to the Commissioner at Washington. All other districts are directly under the supervision of the Commissioner.

When a State highway department desires Federal aid in financing a road on the Federal-aid system, it notifies the district engineer, who, if he has not already done so, immediately makes an examination of the road and the plans proposed for its improvement. If he approves the State's proposals he submits the project either to the chief at San Francisco or to the headquarters at Washington with appropriate recommendations. However, he may at once authorize the State highway department to proceed with the construction subject to subsequent agreement or any modifications of plans which may be required by his superior authorities.

A formal agreement is made between the State and the Federal Government. Construction then proceeds with full authority of the Government under the immediate supervision of State highway engineers and subject to frequent inspection by Federal engineers.

The Federal Government has no official relations with city, county, and local officials.

Administration of State Highways.—Control over the State roads is vested in the State highway departments. The highway department determines the order in which the roads of the State system are to be improved, prepares the plans for the improvement, supervises the construction, and pays for it with State funds entirely under its own control, and, after completion, maintains the roads also with State funds under its own control. The Federal-aid system coincides with the more extensive State systems and, therefore, a considerable portion of State highway improvement is done with Federal aid.

In 14 States the State highway department has full control over the construction and maintenance of all or most of the local roads. Until about 1930 the work of State highway departments extended only to city limits. There has been a strong trend toward State improvement of extensions of main routes into and through cities and in 1938 every State highway department made expenditures on such sections of highway.

STATE PARTICIPATION

The Development of State Highway Departments.—In 1891 New Jersey passed a law providing for a certain measure of State participation in road building. With one exception, it was the first instance in which any State had undertaken to participate directly in the construction of roads. The exception is Kentucky, which had a State highway department and a well defined State road policy from 1821 to 1837, and had completed some 340 miles of roads.

Following New Jersey's example, laws providing for establishment of State highway departments and for granting of State aid were passed in Massachusetts in 1892, in California and Connecticut in 1895, and in Maryland, New York and Vermont in 1898.

Between 1900 and 1915, 38 other States had established highway departments and empowered them with some degree of authority. Several of these previously established departments were materially strengthened and similar agencies were created in the

three remaining States when, in 1916, the Federal-aid road act required the establishment of adequate State agencies as a condition of the granting of Federal aid. The establishment of adequate State highway departments by the 48 States was the most important immediate effect of the Federal-aid law. The first administrative act of the Bureau of Public Roads under the Federal-aid law was to request all States to submit a five-year programme map showing the system of roads upon which the State highway departments would request Federal aid. The rapid and consistent improvement of the main highways of the United States is due to concentration of authority in the State highway departments, to the engineering control thus established and especially to the correlating influence of the Federal Government. The several State systems were substantially welded into a national network by the designation in 1922 of the Federal-aid highway system.

The purpose of the New Jersey law was to establish a State department, employing skilled engineers, which would act in an advisory capacity to county officials, for improvement of road construction. The highway department developed plans and specifications, inspected and supervised the construction, but contracts were let by the counties and the roads were to remain county roads subject to maintenance by the county. As an inducement for counties to seek State aid, funds were appropriated by the State legislature to pay one-third the cost of road construction.

With minor modifications, the New Jersey principle of State aid was subsequently adopted by many other States. In some States joint participation of the State and county in construction of the most important roads was made mandatory. Other variations differentiated the systems as adopted by the several States.

Organization of State Highway Departments.—In most of the States, the highway departments are called State highway commissions, consisting of three to five members, appointed by the Governor, with the consent of the Senate in some States, for a period of from two to six years. In the majority of States, the executive officer of the commission is the State highway engineer, appointed by the commission. In some States the Governor serves as chairman of the commission. In some, the highway departments are bureaus or divisions of highways which are part of the Department of Public Works. The executive officer may have the title of State Highway Engineer, Director of Highways or Commissioner of Highways. In other States the chief executive of the highway department is a State highway commissioner, appointed by the Governor, except in one State—Michigan—where he is elected by popular vote.

Construction of practically all roads of the Federal-aid and State highway systems is by contract let by the State highway departments, to the lowest bidder. All work is advertised. Each State highway department makes its own tests of materials either in its own laboratory or in a nearby commercial laboratory. It likewise conducts its own inspections of construction work. Federal-aid highways are subject also to Federal inspection.

FINANCE

Administration of Local Roads.—County roads, in general, are built and maintained by county officials with funds raised, as a rule, by taxation of real and personal property within the county. In 1938 such funds were supplemented by \$27,178,000 derived from gasoline taxes and other imposts on highway users and assigned for local road improvement. The more advanced counties employ a county engineer or an engineering organization to supervise the technical details of construction, the county governing body acting only as an administrative body. In some States the lesser roads in each county are administered, constructed, and maintained by a host of township and district officials, each of whom may have charge of only a few miles of road. The Federal Government contributed to the construction of a large mileage of local road in its emergency program to provide employment. It has continued this work with authorizations averaging \$16,000,000 annually in the fiscal years 1938 through 1941.

Sources of Highway Revenue.—For many years, the property tax and poll tax were the only sources of road revenues. They were collected and expended by the local Governments. Commutation of the poll tax was permitted. As an indirect source of

revenue, prison labour, while not a large factor, has been used, mainly to give employment to prisoners.

The first motor vehicle fees levied by the States were nominal and were designed merely to cover cost of registration. The rapid growth in motor vehicle registration increased the demand for improved roads with the resulting issuance of State and county bonds to secure funds to speed the improvements beyond the rate possible with limited current revenues. With improved roads, special benefits resulted to operators of motor vehicles and the motor vehicle taxes have been increased in recognition of this fact.

Since 1929 all States have levied a gasoline tax as a source of additional revenue. The tax was first levied in 1919 by four States: Colorado, a 1 cent tax per gallon; New Mexico, 2 cents per gallon; North Dakota, 4 cent per gallon; and Oregon, 1 cent per gallon. In 1920 Kentucky joined the four and levied a gas tax of 1 cent per gallon. In 1921, 15 States levied taxes from 1 cent to 2 cents per gallon. In 1922, four additional States levied taxes. In 1923, 35 States levied a gasoline tax. The tax rate varies from 2 cents to 7 cents per gallon in different States, the weighted average being 3.96 cents per gallon. In 1938 the total State motor-fuel tax earnings, inspection fees, and similar receipts, amounted to \$771,764,000 and the consumption of taxed gasoline was 19,609,728,000 gallons. In that year highway users also paid \$388,825,000 for registration of vehicles and \$16,421,000 as motor carrier taxes. The total contribution of highway users was \$1,177,010,000. Of the amount distributed 4% went for collection costs, 59% for State highway purposes, 23% for local roads, less than 1% for park and forest roads, and 13% went for non-highway purposes.

The total income to State highway departments in 1938 was \$1,096,908,000, and balances on hand brought the total funds available to \$1,500,000,000. The current income from State sources was \$837,343,000, of which motor vehicle users supplied over 98%. Taxes on property no longer supply significant amounts to State highway funds. The net amount of funds received from Federal sources was \$196,826,000. Income from sale of bonds, transfers from local units and from miscellaneous sources, brought the total income from other than current State revenue sources to \$279,565,000.

Expenditures for State administered highways in 1938 amounted to \$895,132,000. The States spent \$523,738,000 for construction of highways and \$232,388,000 for maintenance. These expenditures were divided \$638,685,000 on primary State highways, \$74,970,000 on secondary roads in 13 States, and \$42,471,000 on urban extensions of State highways. The outlay for administration, equipment, highway police, and interest on debt amounted to \$139,066,000. In addition \$84,711,000 was used for retirement of debt, \$121,262,000 was transferred for use on local roads and streets, \$7,898,000 was used for highways not on the State system, and \$26,119,000 was used for non-highway purposes. The total expenditure for all purposes was \$1,351,122,000. Since 1916 a total of \$2,235,000,000 Federal aid and \$1,200,000,000 emergency funds have been authorized by the Federal Government to aid the States in highway improvement. The figure for Federal aid includes authorizations through the fiscal year 1941. For the fiscal year 1940 the authorization is \$100,000,000 for improvement of the Federal-aid system, \$15,000,000 for secondary roads, and \$20,000,000 for elimination of highway-railroad grade crossings.

MODERN ROAD PRACTICE

Types of Road.—Prior to 1904, the major types of surfacing were gravel and macadam, which gave entire satisfaction under the normal traffic of relatively light horse-drawn, steel-tired vehicles, with a bicycle traffic near the cities. The outpouring of motor vehicles from the cities which began about 1904 caused the macadam roads to "ravel," and maintenance under such traffic was impossible. Tars and asphalt were substituted for the weaker binders; first, as dust layers, as protective surface coatings, and then as binders introduced into roads of the macadam type by penetration, and finally as hot admixtures according to the bituminous concrete principle. These types were entirely satisfactory for automobile traffic.

From 1904 to 1914 is the period of bituminous construction. In 1904, there were in the entire country only 18 miles of bituminous rural roads, all in the two States of Massachusetts and Ohio. By 1914, there were 10,500 miles, a mileage which was nearly three-quarters of the aggregate length of all roads of higher type than macadam. The decline in the surface-treated and penetration types of macadam began when motor trucks in considerable numbers began to appear on the rural highways. They brought a demand for rigid pavements of concrete and brick and bituminous concrete on a concrete base.

Although the first concrete road had been built in 1893, in Bellefontaine, O., there were no more than five miles of that type on rural highways in the entire country in 1909. The first big increase occurred in 1912 when more than 250 miles of rural highways were paved, to be followed in 1913 with 500 miles, and in 1914 with more than 1,500 miles. At the close of 1914, there were in the entire country 2,348 miles of concrete roads. Ten years later the mileage had increased to 31,186 and construction was proceeding at the rate of more than 6,000 miles a year, a rate approached by no other type better than gravel.

The increase of motor trucks on the highways also caused a more extensive use of brick, and the bituminous pavements of the mixed type on concrete bases. In 1914 there were approximately 1,600 miles of brick pavement; in 1924 there were 4,319 miles. In 1914, the bituminous concrete or sheet asphalt mileage on rural highways was negligible; in 1924 there were more than 9,700 miles of these types.

Current Policies and Practices in Road Construction.—The main highways are being improved with high-type surfaces such as brick, concrete, and bituminous mixtures. For moderate and light traffic waterbound macadam, gravel, sand-clay, selected soil mixtures, and low-cost bituminous mixtures are used. Practically all surfaces that tend to become dusty in dry weather are made dustless by applying a bituminous treatment during construction or soon thereafter. Great progress has been made in learning how to combine granular materials such as sand and gravel with clay and bituminous binders to form durable surfaces that are moderate in cost.

The kind of soil on which a road surface is placed has a great deal to do with how the surface lasts. Engineers are now able to test soil samples taken from the location where a highway is to be built and determine where the soil will give good support, where the surface must be thickened for additional strength, and where poor soil must be replaced by better material.

Until about 1930 road building efforts were directed largely toward the extension of surfaced mileage. Such a policy was necessary so long as sections of unsurfaced roads remained on principal routes of travel. Most of the gaps are now closed. The objective fixed many years ago has been reached, but the amount of needed highway improvements is greater than ever before. The great increase in volume and speed of traffic has made obsolete the highways built years ago when conditions were different. Existing highways are being modernized by placing better and wider surfaces, eliminating sharp curves and steep grades, eliminating railroad grade crossings, and placing warning and danger signs and marks. Safety of travel is an important consideration in this work.

A great many 2-lane highways have been built 20 feet wide but already there is a trend toward greater width. Many new surfaces are being built to a width of 22 feet, and a surfaced width of 24 feet will soon come to be recognized as a desirable standard for important 2-lane roads. Provision of a third lane is sometimes resorted to where two lanes are not sufficient but because of the danger in using the middle lane it is not a satisfactory solution of traffic congestion problems. Where two lanes are not sufficient, four lanes should be provided. For great volumes of traffic such as flow on main highways adjacent to large cities, the multiple lane highway is the only satisfactory solution. Experience with the first 4-lane highways has shown that traffic flowing in opposite directions must be separated by a dividing strip of some sort if a heavy accident toll is to be avoided.

The greatest congestion, the worst traffic snarl, and a large

portion of the highway accidents are found on the main highways in and near cities. Only the provision of major improvements at a large cost will provide a solution. There is need for express highways cut directly into and through the centre of big cities. These are needed for the service of through traffic and for the daily in-and-out movement of local traffic between the downtown section and the suburbs. By preference such express highways should be constructed as depressed thoroughfares passing under all cross streets.

Elimination of crossings of railroads at grade is one of the most important features of the current highway program. Since 1933, nearly 3,000 crossings have been eliminated in the Federal highway program. This is a large contribution to highway safety and saves much delay and inconvenience to public travel.

About 75% of the rural population is located on secondary or local roads. Improvement of a selected system of these roads is needed to give better access to rural property and to improve social conditions.

CO-OPERATION OF INTERESTS

The United States Highway System.—Through the co-operation of all states and the federal government, effected initially through the agency of the Joint Board on Interstate Highways, and continued by the American Association of State Highway Officials, a system of main transcontinental highways, known as the U.S. highway system, was designated in 1926. This system, which is a portion of the federal-aid system, includes approximately 127,000 miles, composing 26 through routes, many of which extend from one border of the country to the other. The various routes are designated by the distinctive numbers which are displayed upon them, on standard, shield-shaped markers. The standard signs adopted are of two general classes. One group, the danger and caution signs, are of four different shapes representing as many degrees of danger. These have a yellow background with black letters and symbols. The other group includes the standard route marker in the form of a U.S. shield and directional and informational signs, with white backgrounds and black letters.

Highway Planning Surveys.—The Public Roads administration is co-operating with the highway departments of 46 states in conducting state-wide highway planning surveys. Most of the states are now at the end of the pioneer period of road development and the surveys are intended to supply the information needed in planning the broader programs necessary in the future. The surveys are the most comprehensive of any yet undertaken. They are being conducted according to a general plan developed by the Public Roads administration, since it is particularly important that data collected in the various states be on a comparable basis.

A representative of the administration is assigned to each state to keep contact between the Washington organization and the state survey organization. Each state organization consists of a manager, an assistant manager for each of the three main branches of the survey, and an office force and field parties, as required. The three branches of the survey are a road inventory, a traffic survey and a financial and road-use survey. In the road inventory complete records of all existing roads will be obtained, together with a determination of their condition and the property they serve. Both state and county maps will be examined by the states, giving for the first time a complete inventory of the roads of the country. The traffic survey is being conducted by the states, giving for the first time a complete inventory of the traffic of the country. The financial and road-use survey is being conducted by the states, giving for the first time a complete inventory of the financial and road-use of the country.

Highway Research.—A representative of the administration is assigned to each state to keep contact between the Washington organization and the state survey organization. Each state organization consists of a manager, an assistant manager for each of the three main branches of the survey, and an office force and field parties, as required. The three branches of the survey are a road inventory, a traffic survey and a financial and road-use survey. In the road inventory complete records of all existing roads will be obtained, together with a determination of their condition and the property they serve. Both state and county maps will be examined by the states, giving for the first time a complete inventory of the roads of the country. The traffic survey is being conducted by the states, giving for the first time a complete inventory of the traffic of the country. The financial and road-use survey is being conducted by the states, giving for the first time a complete inventory of the financial and road-use of the country.

The investigations conducted include studies of the characteristics of materials; determination of the forces applied to road surfaces by standing and moving vehicles; of stresses developed in the structure of roads and bridges by live loads, and by temperature and other natural causes; analyses of subgrade soils and tests of methods designed for their improvement; studies of the flow of water through drainage structures, of the run-off from drainage areas, of the effect of moisture

on soils and many others of fundamental importance and value.

The tests made on the Bates road in Illinois, the Pittsburg (Calif.) experiments, the impact tests at Arlington, Va., and the intensive studies of highway traffic conducted by the Public Roads administration in co-operation with the authorities of many of the different states, were made in the interest of scientific research, and they have yielded data of considerable value to the highway engineer.

ROADSTER. The term is commonly applied to a small open type automobile body seating two people on one seat, and equipped with a folding top and removable curtains. Usually there is provided behind the seat a compartment to carry baggage.

ROAD TRANSPORT: see MOTOR TRANSPORT, COMMERCIAL; MOTOR TRANSPORT, MILITARY.

ROANNE, a town of east-central France, capital of an arrondissement in the department of Loire, on the left bank of the Loire, 54 mi. N.W. of Lyons on the P.L.M. railway to Moulins. Pop. (1946) 44,518. Roanne (*Rodonna* or *roidonna*) was an ancient city of the Segusianni and a station on the Roman road from Lyons to the sea. In 1447 the lordship of Roanne became the property of the celebrated banker, Jacques Coeur, from whom it passed to the family of Gouffier. In their favour the title was raised to the rank of marquise and in 1566 to the rank of duchy; it became extinct in the early 18th century. A fine bridge of seven arches connects Roanne with the industrial suburb of Le Coteau on the right bank of the river. The town is the seat of a sub-prefect, of a tribunal of commerce, of a chamber of commerce and a board of trade-arbitrators. It is the terminus of the Roanne-Digoin canal and starting-point of Loire navigation.

ROANOKE, a city of western Virginia, U.S., on the Roanoke river, 166 mi. W.S.W. of Richmond; in Roanoke county, but administratively independent. It is on federal highways 11, 220, 221 and 460, and is served by the Norfolk and Western and the Virginian railways. The population of Roanoke was 91,921 in 1950 (80.5% native white, 18.5% Negroes and 1.0% foreign born) and was 69,287 in 1940 by the federal census. The city occupies 26.7 sq. mi. in a beautiful amphitheatre formed by the Blue Ridge and the Allegheny mountains, 940 ft. above sea level. There are commodious hotels and business buildings, a city auditorium seating 5,000, a municipal market, public schools, churches, a handsome municipal building and many parks and playgrounds. The city has a city-manager form of government.

A few miles west is Salem, the county seat and home of Roanoke college (1842); and 6 mi. north is Hollins college for women (1842). Roanoke is an intersection point for railroads and highways, as it was formerly for Indian trails. It is headquarters of the Norfolk and Western railway.

A village called Big Lick (from the salt marshes to which the cattle and wild game came) was founded there about 1852. In 1880 it had a population of 669. In 1887, when the Shenandoah Valley railroad (now part of the Norfolk and Western) made this its southern terminus and moved its general offices there, the name was changed to Roanoke; and in 1884, with a population of 5,000, it was chartered as a city.

ROANOKE, a river of the south Atlantic slope, U.S. With the Staunton, which rises in the Appalachian valley in southwestern Virginia, it constitutes one river, and, flowing in a general southeasterly direction, crosses the boundary between Virginia and North Carolina just above the Fall line and discharges into Albemarle sound. It is 380 mi. long, with a drainage area of 9,237 sq. miles. In 1829 the Weldon canal, 12 mi. long, was opened to afford a passage around the falls, but was abandoned in 1850.

ROARING FORTIES, the belt between latitudes 40° and 50° south latitude characterized by boisterous westerly winds. In this belt the barometric gradients, both in summer and in winter, are steep, and the "planetary circulation" is but little interrupted by land; the "brave west winds" are very strong.

ROBBEN ISLAND, an island at the entrance of Table bay, 7 mi. N.N.W. of Capetown, Union of South Africa. It is some 4 mi. long by 2 broad. The island when discovered was uninhabited. It got its name (*Robben*, Dutch for "seal") from the seals which formerly frequented it, now only occasional visitants. In 1674 ten criminals from London were landed on the island to form a settlement and supply fresh provisions to passing ships. The attempt, which ended in failure, is interesting as the first recorded settlement of English in South Africa. As early as 1657 criminals were banished to the island by the Dutch authorities at Capetown; it has also served as the place of detention of several Kaffir chiefs. With removal of a leper settlement to the mainland in 1928, it was left uninhabited except for keepers of the lighthouse at the southern end. Shortly before World War II, the island was linked in the Union's scheme of heavy coastal defenses. See "Robben Island," *South African Geog. Jour.*, vol. 17 (1934).

ROBBER FLY. The name given to predaceous flies of the family Asilidae of the order Diptera (*q.v.*); they are also called assassin flies. They are predaceous in both the adult and larval stages. The various groups are found in a particular type of habitat. Some occur in woods, on tree trunks and foliage, some on grass and low plants or on the tips of dead twigs, some on sand or gravel and on beaches. The head is hollowed above between the eyes, which have an area of enlarged facets that gives them keen sight. A few kinds, particularly species of *Promachus*, may be serious pests of apiaries; they feed on many kinds of bees, as well as upon almost all kinds of flying insects. Their legs are long and adapted for capturing prey in flight and holding it while it is eaten. They inject a fluid into their victims which breaks down the muscular tissues so that only the skeleton remains. There are more than 4,000 species distributed through the world, most of them rather dull coloured, but some are metallic. They vary in length from $\frac{1}{16}$ in. to $\frac{1}{2}$ in. (C. H. C.N.)

ROBBERS SYNOD, the name given to an irregular ecclesiastical council held at Ephesus in A.D. 449. See EPHESUS, COUNCILS OF.

ROBBERY, a felony in English law, is the unlawful and forcible taking of goods or money from the person of another by violence or threatened violence. Robbery is larceny (*q.v.*) with violence. It is a specific offence under the Larceny Act, 1916, which provides by s. 23 that every person who (a) being armed with any offensive weapon or instrument, or being together with one other person or more, robs, or assaults with intent to rob, any person; (b) robs any person and, at the time of or immediately before or immediately after such robbery, uses any personal violence to any person; shall be guilty of felony and on conviction thereof liable to penal servitude for life, and, in addition, if a male, to be once privately whipped. Also every person who robs any person shall be guilty of felony and on conviction thereof liable to penal servitude for any term not exceeding 14 years, and every person who assaults any person with intent to rob shall be guilty of felony and on conviction thereof liable to penal servitude for any term not exceeding five years. To constitute the offence there must be violence or the placing of the prosecutor in bodily fear; the goods or money must be taken from the person or in the presence of the prosecutor; and in fact a larceny must be proved under the before mentioned circumstances. The elements of the offense are essentially the same under U.S. law.

ROBERT I (c. 865-923), king of France, or king of the Franks, was the younger son of Robert the Strong, count of Anjou, and the brother of Odo, or Eudes, who became king of the western Franks in 888. He did not claim the crown of France when his brother died in 898; but recognizing the supremacy of the Carolingian king, Charles III, the Simple, he continued to defend northern France from the attacks of the Normans as "duke of the Franks." About 921 Robert, supported by many of the clergy and by some of the most powerful of the Frankish nobles, took up arms, drove Charles into Lorraine, and was himself crowned king of the Franks at Reims on June 29, 922. Collecting an army, Charles marched against the usurper, and on June 15, 923, in a stubborn and sanguinary battle near Soissons, Robert was killed, according to one tradition, in single combat with his rival,

Robert left a son, Hugh the Great, duke of the Franks, and his grandson was Hugh Capet, king of France.

See F. Lot, *Les Derniers Carolingiens* (1891); and E. Lavisse, *Histoire de France*, tome ii. (1903).

ROBERT II. (c. 970-1031), king of France, was a son of Hugh Capet, and was born at Orleans. He was educated at Reims under Gerbert, afterwards Pope Silvester II. As the ideal of mediaeval Christianity he won his surname of "Pious" by his humility and charity, but he also possessed some of the qualities of a soldier and a statesman. His father associated him with himself in the government of France, and he was crowned in December 987, becoming sole king on Hugh's death in October 996. In 988 he had married Rosala, or Susanna, widow of Arnold II, count of Flanders. He repudiated her in 989, fixing his affections upon Bertha, daughter of Conrad the Peaceful, king of Burgundy, or Arles, and wife of Eudes I., count of Blois; and although the pair were related, and the king had been godfather to one of Bertha's children, they were married in 996, a year after the death of Eudes. Pope Gregory V. excommunicated the king, and a council at Rome imposed a seven years' penance upon him. For five years the king braved all anathemas, but about 1002 he gave up Bertha and married Constance, daughter of a certain Count William. Still attached to Bertha, Robert took this lady with him to Rome in 1010, but the pope refused to recognize their marriage, and the king was forced to return to Constance. By this wife Robert had four sons, and in 1017, the eldest of these, Hugh, (1007-1025), was crowned as his father's colleague and successor. After Hugh's death Robert's concluding days were troubled by a rising on the part of his younger sons, and after a short war, in which he was worsted, the king died at Melun on July 20, 1031.

His life was written by his chaplain, Helgaud, and this panegyric, *Epitoma vitae Roberti regis*, is published by J. P. Migne in the *Patrologia Latina*, tome cxli. (Paris, 1844). See also C. Pfister, *Études sur le règne de Robert le Pieux* (1885); and E. Lavisse, *Histoire de France*, tome ii. (1901).

ROBERT (1275-1343), king of Naples, was the son of Charles II., duke of Anjou and king of Naples. On the death of Charles in 1309 Robert succeeded to the throne, although his nephew Caroberto (Carlo Roberto), son of his elder brother Charles Martel, who had died before his father, had a prior claim. He was crowned by Pope Clement V. at Avignon, and on the descent into Italy of the emperor Henry VII. was appointed papal vicar in Romagna to resist the imperialists; thenceforth he became the recognized leader of the Guelphs or papal faction in Italy and took part in all the wars against the Ghibellines. On various occasions he obtained for himself or his sons the suzerainty over Rome, Florence and other cities, and was regarded as the most powerful Italian prince of his day. Pope John XXII. created him papal vicar in Italy against the emperor Louis the Bavarian. In 1320 Robert summoned his kinsman Philip V. of France to Italy, and he waged war against Sicily once more from 1325 to 1341, but failed to drive out the Aragonese. He died in 1343, just as he was about to lead another expedition to the island. Robert was a man of learning, devoted to literature, and a generous patron of literary men; he befriended Petrarch. Dante described Robert as *a re da sermone* (word king).

See G. Villani, *Cronache*; M. Murena, *Vita di Roberto d'Angiò, re di Napoli* (Naples, 1770); and *Archivio storico Siciliano* (1884, viii. 511 seq.).

ROBERT I., "THE BRUCE" (1274-1329), king of Scotland, the son of Robert de Bruce VII., earl of Carrick by right of his wife Marjorie, was a direct descendant of a Norman baron who accompanied William I. to England. He was probably born at Turnberry, Ayrshire, on July 11, 1274, and is said to have spent his youth at the court of Edward I., where he must have watched the progress of the suit for the crown of Scotland. After the death of Margaret, the "maid of Norway," Bruce's grandfather claimed the crown by right of his descent from David I.; but John de Balliol, grandson of Margaret, being preferred by the commissioners of Edward I., he resigned his estates to Bruce's father, who assumed the title of Lord of Annandale (1295). In 1292, Bruce became earl of Carrick, by which title he is often known. Some four years later Bruce and his father swore fealty to

Edward I., but when Sir William Wallace raised his standard, Bruce followed the popular leader and harried the forces of John de Warenne, Edward's general. In July, 1297, however, he was forced to sign the capitulation of Irvine, whereby the Scottish lords were pardoned in return for their allegiance.

Bruce thus took no part in the momentary triumph and final defeat of Wallace, who continued the struggle almost unaided. Soon after Bruce again appears to have sided with his countrymen, but he was not yet regarded as an open enemy of the English, for his estates were left intact, and in 1299 he was appointed co-regent of Scotland, together with William Lamberton, bishop of St. Andrews, and John Comyn the younger. For the next four years he remained passive, and in 1304 even supported Edward I. in the capture of Stirling, but secretly he entered into a bond with Lamberton which bound him to the patriotic cause.

The second period of his life, which was occupied by the contest for the kingdom, now began. After the execution of Wallace in 1305, Edward sought to conciliate the Scottish nobles by granting a liberal constitution to Scotland. Bruce is reputed to have been one of the advisers, but his fidelity was already suspected and in 1306 he returned to Scotland secretly. In the same year he murdered his old enemy Comyn, and was thenceforward definitely committed to the Scottish cause. Collecting his adherents, Bruce marched to Scone where he was crowned on March 27, 1306, and a few days later was placed on the throne according to an ancient Celtic ceremony, by the Macduffs, earls of Fife. He then set out to win his kingdom, but after being defeated at Methven and at Dalry in Strathfillan, he fled almost alone to the island of Rathlin. Proclaimed an outlaw, excommunicated by the pope, his wife and daughter in the hands of the English, and his brother executed, Bruce's cause seemed hopeless, but on July 7, 1307, Edward I. died, and Bruce was opposed only by his incompetent son Edward II. In the winter of 1307 and in 1308, hurrying to Aberdeenshire, he harried the lands of the earl of Buchan, whom he defeated near Inverurie on May 23, 1308, while his brother Edward reduced Galloway. He then crossed to Argyllshire, took the pass of Brander (1309), captured Dunstaffnage, and in March held his first parliament at St. Andrews.

A truce having been effected by Pope Clement V. in 1309, Bruce was recognized as king by the clergy of Scotland in Feb. 1310, in spite of his excommunication; and with this backing he set out to reduce the strongholds still held by the English. Lullinshaw fell towards the end of 1310, Dumbarton in Oct. 1311, Perth in Jan. 1312, two raids into the north of England were also successful in March 1313, Roxburgh and Edinburgh were captured and in May the Isle of Man was subdued. By the end of 1313, Stirling, Bothwell and Berwick alone remained English and these Edward II. made a determined effort to save. He reached Falkirk on June 22, 1314, and two days later the battle of Bannockburn was fought, in which the defeat of the English determined the independence of Scotland and secured the title of Bruce. On Aug. 26, 1314, the parliament at Ayr, the Scottish parliament, elected Bruce king of Scotland.

The English king, Edward II., was so alarmed by the success of Bruce that he sent a large army to Scotland, but it was defeated at the battle of Methven on Sept. 19, 1314. Bruce then marched into England, and on Oct. 23, 1314, he was crowned king of England at Westminster. He was, however, forced to return to Scotland, and on Dec. 17, 1314, he was crowned king of Scotland at Scone. In 1315, he was defeated by the English at the battle of the Clouds, but he was able to escape and return to Scotland. In 1316, he was again defeated by the English at the battle of the Mure, but he was able to escape and return to Scotland. In 1317, he was again defeated by the English at the battle of the Mure, but he was able to escape and return to Scotland. In 1318, he was again defeated by the English at the battle of the Mure, but he was able to escape and return to Scotland. In 1319, he was again defeated by the English at the battle of the Mure, but he was able to escape and return to Scotland.

The English king, Edward II., was so alarmed by the success of Bruce that he sent a large army to Scotland, but it was defeated at the battle of Methven on Sept. 19, 1314. Bruce then marched into England, and on Oct. 23, 1314, he was crowned king of England at Westminster. He was, however, forced to return to Scotland, and on Dec. 17, 1314, he was crowned king of Scotland at Scone. In 1315, he was defeated by the English at the battle of the Clouds, but he was able to escape and return to Scotland. In 1316, he was again defeated by the English at the battle of the Mure, but he was able to escape and return to Scotland. In 1317, he was again defeated by the English at the battle of the Mure, but he was able to escape and return to Scotland. In 1318, he was again defeated by the English at the battle of the Mure, but he was able to escape and return to Scotland. In 1319, he was again defeated by the English at the battle of the Mure, but he was able to escape and return to Scotland.

On May 30, 1323, Edward was forced to make a truce of 13 years. On the accession of Edward III, 1327, the treaty of York was signed, whereby "Scotland according to its ancient bounds in the days of Alexander III, should remain to Robert, king of Scots, and his heirs free and divided from England, without any subjection, servitude, claim or demand whatsoever." This was ratified by the marriage of Edward's sister, Joanna, to David, Bruce's infant son (July 12, 1328). The chief author of Scottish independence barely survived his work. In 1327 he conducted an expedition into Ireland, but on his return, he spent his remaining years at Cardross, on the Clyde, where he died from leprosy on June 7, 1329. His body was buried at Dunfermline, his heart at Melrose.

BIBLIOGRAPHY.—The chief contemporary authorities for the life of Bruce are coloured to some extent by the nationality of the writers. On the Scottish side, *The Brus*, a poem by John Barbour, ed. by W. W. Skene (Edinburgh, 1824), and the *Chronica gentis Scotorum* of John of Fordun, ed. by W. P. Skene (Edinburgh, 1871-72), are perhaps the most valuable. *The Chronicle of Lanercost*, ed. by J. Stevenson (Edinburgh, 1839), is also important. The English chronicles which may be consulted with advantage are those of Walter of Hemmingford, ed. by H. C. Hamilton (1846-49) and of Peter Langtoft, ed. by T. Wright (1866-68), and the *Scalacronica* of Thomas Gray, ed. by J. Stevenson (Edinburgh, 1836). For the documents of the time reference should be made to the *Calendar of Documents relating to Scotland*, ed. by J. Bain (Edinburgh, 1881-88), *Documents and Records Illustrating the History of Scotland*, vol. I, ed. by F. Palgrave (1837); the *Rotuli Scotiae* (1814-19), and the *Poedera* of T. Rymer, vol. I (1704). See also Sir H. Maxwell, *Robert the Bruce* (1897); A. M. Mackenzie, *Robert Bruce, King of Scots* (London, 1934).

ROBERT II. (1316-1390), called "the Steward," king of Scotland, a son of Walter, the steward of Scotland (d. 1326), and Marjorie (d. 1316), daughter of King Robert the Bruce, was born on March 2, 1316. In 1318 the Scottish parliament decreed that if King Robert died without sons the crown should pass to his grandson; but the birth of a son, afterwards King David II., to Bruce in 1324 postponed the accession of Robert for nearly 42 years. Soon after the infant David became king in 1329, the Steward began to take a prominent part in the affairs of Scotland. He was one of the leaders of the Scottish army at the battle of Halidon Hill in July 1333; and together with John Randolph, 3rd earl of Moray (d. 1346), was chosen co-regent of Scotland, while David sought safety in France. The colleagues soon quarrelled; Randolph fell into the hands of the English, and Robert became sole regent until the return of David in 1341. The Steward escaped from the battle of Neville's Cross in 1346, and was again regent while the king was a captive in England.

Soon after this event some friction arose between Robert and his royal uncle. Accused, probably without truth, of desertion at Neville's Cross, the Steward as heir-apparent was chagrined by David's recognition of Edward III. as his successor.

In 1363 he rose in rebellion, and after having made his submission was seized and imprisoned together with his three sons, being only released a short time before David's death in February 1371. By the terms of the decree of 1318 Robert now succeeded to the throne, and was crowned at Scone in March 1371. His reign was unimportant; for relations with England and France see SCOTLAND: History. The king died at Dundonald on May 13, 1390, and was buried at Scone.

See Andrew of Wyntoun, *The Orygynale Cronykyl of Scotland*, edited by D. Laing (Edinburgh, 1872-79); John of Fordun, *Scotichronicon*, continued by Walter Bower, ed. T. Hearne (Oxford, 1722); John Major, *Historia maioris Britannie* translated by A. Constable (Edinburgh, 1891); and P. F. Tytler, *History of Scotland* (Edinburgh, 1841-43).

ROBERT III. (c. 1340-1406), king of Scotland, was the eldest son of King Robert II. by his mistress, Elizabeth Mure, and was legitimized when his parents were married about 1349. In 1368 he was created earl of Carrick, and he took some part in the government of the kingdom until about 1387, when he was disabled by the kick of a horse. It was probably in consequence of this accident that his brother Robert, earl of Fife, and not the crown prince himself, was made guardian of the kingdom in 1389; but the latter succeeded to the throne on his father's death in May 1390. At this time he changed his baptismal name of John, which was unpopular owing to its connection with John de Balliol,

for that of Robert, being crowned at Scone in August 1390 as King Robert III. The new king was only the nominal ruler of Scotland, the real power being in the hands of his brother, the earl of Fife. In 1399, his elder son, David, duke of Rothesay, was appointed lieutenant of the kingdom; but this event was followed by an English invasion of Scotland, by serious differences between Rothesay and his uncle, Robert, now duke of Albany, and finally in March 1402 by Rothesay's mysterious death at Falkland. Early in 1406 the king's only surviving son, afterwards King James I., was captured by the English; and on April 4, 1406, Robert died, probably at Rothesay, and was buried at Paisley.

ROBERT, the name of two dukes of Normandy.

ROBERT I. (d. 1035), called Robert the Devil, was the younger son of Richard II., duke of Normandy (d. 1026), and father of William the Conqueror. In 1028 he succeeded his brother, Richard III., whom he was accused of poisoning, as duke of Normandy. Robert sheltered the exiled English princes, Edward, afterwards King Edward the Confessor, and his brother Alfred, and fitted out a fleet for the purpose of restoring them to their inheritance, but this was scattered by a storm. When returning from a pilgrimage to Jerusalem, he died at Nicea on July 22, 1035. Robert is the subject of several poems and romances. (See ROBERT THE DEVIL.)

ROBERT II. (c. 1034-1134), called Robert Curthose, was the eldest son of William the Conqueror. Although recognized in boyhood as his father's successor in Normandy, he twice revolted against his father. (See WILLIAM I.) When the Conqueror died in September 1087 Robert became duke of Normandy, but not king of England; although he received offers of help, he took no serious steps to displace his younger brother, King William II. In Normandy his rule was weak and irresolute. He lost the county of Maine, which for some years had been united with Normandy, and he was soon at variance with his brothers, the younger of whom, Henry, he seized and put into prison. In 1089 his duchy was invaded by William II., who soon made peace with Robert, the two agreeing to dispossess their brother Henry of his lands in Normandy. This peace lasted until 1094, when occasions of difference again arose and another struggle began, Robert being aided by King Philip I. of France.

This warfare ended in 1096, when Robert set out on the first crusade, having raised money for this purpose by pledging his duchy to William for 10,000 marks. He returned to Normandy in September 1100.

William Rufus died while Robert was on his homeward way, and in Italy the Norman duke was greeted as king of England; but when he reached Normandy he learned that the English throne was already in the possession of Henry I. In July 1101 he crossed over to England, intending to contest his brother's title, but Henry met him near Alton, in Hampshire, and an amicable arrangement was made between them. But there was no lasting peace. In 1106 the English king crossed over to Normandy, and at the battle of Tinchebrai (Sept. 28, 1106), Henry took his brother prisoner and carried him to England. For twenty-eight years Robert was a captive, first in the Tower of London, and later in the castles of Devizes and Cardiff. He died probably at Cardiff on Feb. 10, 1134.

The chief sources for the life of Robert II. are Ordericus Vitalis, William of Malmesbury and other chroniclers of the time. See E. A. Freeman, *History of the Norman Conquest* (1870-76), and *The Reign of Rufus* (1888).

ROBERT, HUBERT (1733-1808), French artist, born at Paris on May 29, 1733, deserves to be remembered not so much for his skill as a painter as for the liveliness and point with which he treated his subjects. His work has a scenic character, and it was this quality which led Voltaire to entrust him with the decorations of his theatre at Ferney. Robert died of apoplexy on April 15, 1808.

See C. Blanc, *Hist. des peintres*; Villot, *Notice des tableaux du Louvre*; Julius Meyer, *Gesch. mod. fr. Malerei*.

ROBERT GUISCARD (i.e., "the resourceful") (c. 1015-1085), the most remarkable of the Norman adventurers who conquered southern Italy. Those who first came in 1016 to seek their fortune in Apulia and Calabria seem to have had no political

ambitions. They arrived in small groups and lacked organization and experienced leadership. They were prepared to live as mercenaries in the service of Greeks or of Lombards. It was not until 1030 that Sergius of Naples, by installing the leader Rainulf in the fortress of Aversa, gave them their first *piad-a-terre* and that they began an organized conquest of the land. Foremost in this work were the sons of Tancred de Hauteville, whose lands near Coutances were too modest to support his large family. William "Iron Arm" and Drogo were successively leaders of those Normans who from 1040 were extending their possessions in Apulia and Calabria, and among their brothers who joined them were Humphrey in 1044 and Robert Guiscard in 1046. At first, Robert was not made welcome and was forced, as were many of his compatriots, to live like a brigand, terrorizing and laying waste the countryside. Because of the distress so caused, Leo IX attempted to subdue the Normans by force; but their principal leaders, among them Robert, combined in 1053 to defeat the pope at Civitate. Thereafter Robert prospered. In 1057 he succeeded Humphrey as recognized leader of the Normans in Apulia. In 1059 Pope Nicholas II, seeking independence from the German king Henry IV and the Roman nobility, turned to the Normans as allies. On Aug. 23, 1059, Robert became a vassal of the pope, promising tribute and help when needed. In return he became "by grace of God and St. Peter duke of Calabria and Apulia and future lord of Sicily." It was a master stroke. Robert's dominion was legitimized by solemn papal investiture.

In the next 20 years Guiscard made an amazing series of conquests at the expense of Moslems, Greeks and Lombards. Invading Sicily with his brother Roger, he captured Messina (1061) and Palermo (1072). Bari was reduced (April 1071) and the Greeks were finally ousted from southern Italy. The territory of Salerno was already Robert's; in Dec. 1076 he took the city, expelling its Lombard prince Gisulf, whose sister Sicelgata he had married.

The Norman attacks on Benevento, a papal fief, alarmed Gregory VII but, pressed by Henry IV, he turned again to the Normans and at Ceperano (June 1080) reinvested Robert, securing him also in the southern Abruzzi, but reserving Salerno. Guiscard's last enterprise was his attack on the eastern empire, a rallying ground for his rebel vassals. He contemplated seizing the imperial throne and took up the cause of Michael VII, who had been deposed in 1078 and to whose son his daughter had been betrothed. He sailed against the empire in May 1081 and had occupied Corfu and Durazzo by Feb. 1082. He was, however, recalled to the aid of Gregory VII, who was besieged in San Angelo by Henry IV (June 1083). Marching north, he entered Rome and forced Henry to retire, but an *émouvée* of the citizens led to a three days' sack of the city (May 1084), after which Guiscard escorted the pope to Salerno. His son Bohemund (q.v.), for a time master of Thessaly, had now lost the Greek conquests. Robert, returning to restore them, occupied Corfu and Cephalonia, but died of fever in the latter on July 17, 1085.

Guiscard was succeeded by Roger "Borsa," his son by Sicelgata; Bohemund, his son by an earlier Norman wife, Alberada, being set aside. At his death Robert was duke of Apulia and Calabria, prince of Salerno and suzerain of Sicily.

Robert's successes had been due not only to his great qualities but to the entente with the papal see. He created and enforced a strong ducal power which, however, was met by many baronial revolts, one being in 1078, when he demanded from the Apulian vassals an "aid" on the betrothal of his daughter. In conquering such wide territories he had little time to organize them internally. In the history of the Norman kingdom of Italy, Guiscard remains essentially the hero and founder, as his nephew Roger II is the statesman and organizer.

ROBERT OF AUXERRE (c. 1156-1212), French chronicler, was an inmate of the monastery of St. Marien at Auxerre. At the request of Milo de Traine (1155-1202), abbot of this house, he wrote a *Chronicon*, or universal history, which covers the period between the creation of the world and 1211. Robert is an original authority for the period from 1181 to 1211. Two continuators took the work down to 1228 and it was extensively used by later chroniclers. The original manuscript is now at Auxerre.

See A. Molinier, *Les Sources de l'histoire de France*, tomes III. and IV. (1903-04).

ROBERT OF COURTENAY (d. 1228), emperor of Rumania, or Constantinople, was a younger son of the emperor Peter of Courtenay, and was descended from the French king, Louis VI., while his mother, Yolande, was a sister of Baldwin and Henry of Flanders, the first and second emperors of Constantinople. When it became known in France that Peter of Courtenay was dead, his eldest son, Philip, renounced the succession in favour of his brother Robert, who set out to take possession of his distracted inheritance. Crowned emperor on March 25, 1221, Robert appealed for help to the pope and to the king of France; but meanwhile his lands were falling into the hands of the Greeks. Some little aid was sent from western Europe, but soon Robert was compelled to make peace with his chief foe, John Ducas Vatatzes, emperor of Nicaea, who was confirmed in all his conquests. Robert repudiated his affianced bride Eudoxia, daughter of Theodore Lascaris I., and married a French lady, already the fiancée of a Burgundian, by whom Robert was driven from Constantinople, and early in 1228 he died in Achaia.

See Gibbon, *Decline and Fall of the Roman Empire*, ed. Bury (1912), vol. 6, p. 449.

ROBERT OF GLOUCESTER, English chronicler, is known only through his connection with the work which bears his name. This is a vernacular history of England, from the days of the legendary Brut to the year 1270, and is written in rhymed couplets. The lines are of 14 syllables, with a break after the eighth syllable. He probably wrote about the year 1300. The earlier part of his chronicle (up to 1135) may be from another hand, since it occurs in some manuscripts in a shorter form, and with an exceedingly brief continuation by an anonymous versifier. The authorities employed for the earlier part were Geoffrey of Monmouth, Henry of Huntingdon, William of Malmesbury, the English chronicles, and some minor sources; Robert, in making his recension of it, also used the *Brut* of Layamon. From 1135 to 1256 Robert is still a compiler, although references to oral tradition become more frequent as he approaches his own time. From 1256 to 1270 he has the value of a contemporary authority. But he is more important to the philologist than to the historian. His chronicle is one of the last works written in Old English.

Robert's chronicle was first edited by T. Hearne (2 vols., Oxford, 1724); but this text is now superseded by that of W. Aldis Wright (2 vols., Rolls Series, 1887). Minor works attributed to the author are: a *Life of St. Alban* in verse (ms. Ashmole 431); a *Life of St. Patrick*, also in verse (ms. Tanner 17); a *Life of St. Bridget* (ms. C.C.C. Cambridge, 145); and a *Life of St. Alphege* (ms. Cott., Julius D. ix.). A *Martyrdom of St. Thomas Becket* and a *Life of St. Brendan*, both attributed to Robert, were printed by the Percy Society in 1845.

See T. D. Hardy's *Descriptive Catalogue of mss.* i. 25, 68, iii. 187-9, 633; K. Brossmer, *Über die Quellen der Chronik des R. von Gloucester* (Striegau, 1887); W. Elmer in *Anglia* (1888), x. 3-37, 291-322; H. Ströhmeyer, *Der Stil der Reimchronik R. von Gloucester* (1891).

ROBERT OF JUMIEGES (d. c. 1090), archbishop of Canterbury, was a Norman who became prior of St. Ouen at Rouen and then abbot of Jumieges. A close friend of the future king of England, Edward the Confessor, he crossed over to England with Edward in 1042, and in 1044 became bishop of London. Robert was the most trusted and the most prominent of the king's foreign friends, and was the leader of the party hostile to the influence of Earl Godwine. In 1051, although the chapter had already made an election, Edward appointed him archbishop of Canterbury. He seems to have been sent by the king on an errand to Duke William of Normandy, and on the return of Godwine

from exile in 1052 he fled in great haste from England. He was outlawed and deposed, and he died at Jumièges about 1070.

See *Two Saxon Chronicles*, edited by J. Earle and C. Plummer (Oxford, 1892); and E. A. Freeman, *History of the Norman Conquest* (Oxford, 1870-76).

ROBERT OF TORIGNI (c. 1110-1186), mediaeval chronicler, was prior of Bec in 1149, and in 1154 became abbot of Mont St. Michel, whence he is also sometimes called Robertus de Monte. He died, according to Potthast, on May 29, 1186. He wrote additions and appendices to the chronicle of Siebert of Gembloux, covering the period A.D. 1085-1100, and a chronicle in continuation of Siebert, extending from 1100 to 1186, of great value for Anglo-Norman history. It is for continental affairs between 1154 and 1170 that his information is valuable.

The best modern editions are the *Chronique de Robert de Torigni*, etc., edited by Léopold Delisle for the *Soc. de l'Histoire de Normandie* (Rouen, 1872-1873), and *Chronicle of Robert of Torigni*, edited with an introduction, by Richard Howlett (Rolls Series, No. 82, iv, 1889).

ROBERTS, FREDERICK SLEIGH ROBERTS, EARL (1832-1914), British soldier, second son of General Sir Abraham Roberts, G.C.B., was born at Cawnpore, India, on Sept. 30, 1832. Educated at Eton, Sandhurst and Addiscombe, he obtained a commission in the Bengal Artillery on Dec. 22, 1851. In the following year he was posted to a field battery at Peshawar, where he also acted as aide-de-camp to his father, who commanded the Peshawar division. In 1856 Roberts was appointed to the quarter-master-general's department of the staff, in which he remained for 22 years, passing from one grade to another until he became quarter-master-general in India. On the outbreak of the Mutiny in 1857, Roberts, at first, was staff officer to the movable column operating against the mutineers in the Punjab, but, towards the end of June, he joined the Delhi Field Force, and was deputy assistant quarter-master-general with the artillery during the operations against Delhi. He served under Sir Colin Campbell at the second relief of Lucknow in November, at the battle of Cawnpore on Dec. 6 and the subsequent pursuit and defeat of the Gwalior contingent near Shinnajpur.

Roberts distinguished himself at the engagement of Khudaganj, on Jan. 2, 1858, and he was recommended for the Victoria Cross for acts of gallantry there. He was present at the reoccupation of Fatehgarh on Jan. 6, the storm of Mianganj in February, the siege and capture of Lucknow in March, and the action at Kursi on the 22nd of that month, after which he went home on sick leave. For his services in the Mutiny he was seven times mentioned in despatches, received the medal with three clasps, the Victoria Cross, and on his promotion to captain, in Oct. 1860, a brevet majority. On May 17, 1859 he married, at Waterford, Miss Nora Bews, and on his return to India was entrusted with the organization of the viceroy's camps during the progresses through Oudh, the North-West Provinces, the Punjab and Central India in 1860 and 1861. In Dec. 1863 he took part, under Major-General Garcock, in the Umbeyla campaign among the mountains to the north of Peshawar, and was present at the storm of Lahu, the capture of Umbeyla and the destruction of Mulka.

In 1867 Roberts was appointed assistant quarter-master-general to Sir Donald Stewart's Bengal Brigade for Abyssinia. He showed judgment in embarking each unit complete in every detail, instead of despatching camp equipage in one ship, transport in another, and so on, as was customary. He arrived at Zula, Annesley Bay, in the Red Sea, the base of the expedition, on Feb. 3, 1868, and remained there as senior base staff officer during the four months' campaign. At its close he superintended the re-embarkation of the whole army. He returned to India the following year as first assistant quarter-master-general. In the autumn of 1871 he made the arrangements for the expedition into Lushai, between south-east Bengal and Burma, fitted out two columns under Brigadier-Generals Bouchier and Brownlow, and himself accompanied the first. A road, over 100 m. long, was cut through dense gloomy forests in stifling heat, and the column was attacked by cholera; but the object of the expedition was successfully accomplished, and Roberts, who was present at the capture of the Kholoi villages and the action in the Northlang range, and commanded the troops

at the burning of Taikum, was mentioned in despatches and made a Companion of the Bath. On his return in March 1872, he became deputy quarter-master-general in Bengal, and in 1875 quarter-master-general and colonel. He settled the details of the great camp of exercise at Delhi on the occasion of the visit of the prince of Wales in January 1876, and attended H.R.H. at the manoeuvres. He also superintended the arrangements for the great durbar at Delhi on Jan. 1, 1877, when Queen Victoria was proclaimed empress of India.

In 1878 Roberts was appointed to the command of the Frontier Field Force at Abbottabad, in Hazara; but in the autumn, on the repulse of the Chamberlain Mission by the Afghans, and the formation of three columns to advance into Afghanistan by the Khyber, the Bolan and the Kurram passes, he was given the command of the Kurram Field Force, with the rank of major-general. Concentrating his column at Thal, he advanced to Kurram towards the end of November, and having formed an advanced base there, moved on to Habib Kila. Under cover of preparations for a front attack on the Peiwar Kotal, he reconnoitred that formidable position, and on the night of Dec. 1, moved part of his force to attack the Spingawi Kotal, in order to turn the Afghan left flank, leaving the remainder of the force to feign a front attack on the Peiwar, and to guard the camp. After a very difficult night march the Spingawi Kotal was carried at daybreak on the 2nd, and, later, the Afghans on the Peiwar Kotal, threatened in rear, abandoned the position. The next morning Roberts occupied the Peiwar, and on the 6th advanced to Ali Khel. He reconnoitred the Shutargardan and the Sapari passes, and made a strong reconnaissance through Khoist, in which some fighting took place, and at the end of January returned to Hagir Pir, in Kurram, where his force remained in occupation. In July Major Cavanaugh, the British envoy to the new amir, Yakub Khan, passed through Kurram on his way to Kabul, and, shortly afterwards, Roberts left his Kurram command and went to Simla to take his seat on the army commission, where he strongly advocated the abolition of the three Presidency armies, and the substitution for them of four army corps, a measure which was carried out sixteen years later.

While Roberts was at Simla, news arrived on Sept. 5 of the murder of Cavanaugh and his companions at Kabul. The Peshawar Valley Force had been broken up; Sir Donald Stewart was still at Kandahar, but most of his troops had started for India; Roberts, therefore, had the only force ready to strike rapidly at Kabul. It was hastily reinforced, and he hurried back to Kurram to take command, as a lieutenant-general, of the Kabul Field Force (7,500 men and 22 guns). By Sept. 19, a brigade was entrenched on the Shutargardan, and as Roberts advanced, the Amir Yakub Khan came into his camp. An Afghan force of 8,000 men blocked the way in a strong position on the heights beyond Charasia, and on Oct. 6, Roberts repeated the tactics that had done him such good service at the Peiwar in the previous year, and sending Brigadier-General T. D. Baker with the greater part of his force to turn the Afghan right flank, threatened the pass in front with the remainder. By the afternoon Baker had seized the position, and the enemy, severely defeated, were in full retreat. Kabul was occupied without further opposition.

The city was spared, but punishment was meted out to those convicted of complicity in the murder of the British Mission. Yakub Khan abandoned on Oct. 12, and was eventually deported to India. The troops occupied the Sherpur cantonments; but in November a religious war was proclaimed by the Mullahs, and early in December, in order to prevent a threatening combination of Afghan tribes against him, Roberts moved out two columns to attack them in detail. After considerable fighting near Kabul, the numbers of the enemy became so great that he was forced to concentrate his troops again at Sherpur, the defences of which had been greatly improved and strengthened. Sherpur was invested by the enemy, and early on Dec. 23, was attacked by over 100,000 Afghans. They were driven off with great loss; and on making a second attempt to storm the place, were met by Roberts, who moved out, attacked them in flank, and defeated them.

Roberts now recommended the political dismemberment of Afghanistan, and negotiations were carried on with the northern

tribes for the appointment of an amir for the Kabul district only. On May 5, Sir Donald Stewart arrived with his column from Kandahar and assumed the supreme command in Afghanistan, Roberts retaining, under Stewart, the command of the two Kabul divisions, and organizing an efficient transport corps under Colonel R. Low, which was soon to be of inestimable value. On July 22, Abdur Rahman was proclaimed Amir of Kabul; and Roberts was preparing to withdraw his troops to India by the Kurram route, when news arrived that a British brigade had been totally defeated at Maiwand on July 27, and that Lieutenant-General Primrose was besieged in Kandahar. Roberts was ordered to proceed thither at once with a specially selected column of 10,000 troops and his new transport corps. He started on his famous march on Aug. 9, and arrived at Kandahar on the morning of the 31st, having covered 313 miles in twenty-two days. On the following day he fought the battle of Kandahar and gained a complete victory. Roberts was now created K.C.B., G.C.B. and a baronet, and was given the command of the Madras army.

Before proceeding to Madras, Roberts went home on furlough, and when the news of the disaster at Majuba Hill in South Africa arrived in London at the end of February 1881, he was appointed governor of Natal and commander-in-chief in South Africa. He arrived at Cape Town to find that peace had been made with the Boers, and that instructions were awaiting him to return home. The same year he attended the autumn manoeuvres in Hanover as the guest of the German emperor. He declined the post of quartermaster-general to the forces in succession to Sir Garnet Wolseley, and returned to India, arriving at Madras in November. The following year he visited Burma with the viceroy, and in 1885 attended the meeting between Abdur Rahman and Lord Dufferin at Rawalpindi at the time of the Panjdeh incident, in connection with which he had been nominated to the command of an army corps in case of hostilities. In July he succeeded Sir Donald Stewart as commander-in-chief in India, and during his seven years' tenure of this high position instituted many measures for the benefit of the army, and greatly assisted the development of frontier communications and defence. At the end of 1886, at the request of the viceroy, he took personal command for a time of the forces in Burma, and organized measures for the suppression of dacoity. In 1892 he was created Baron Roberts of Kandahar and Waterford. In 1893 he left India for good, and the G.C.S.I. was bestowed upon him. He was promoted to be field-marshal in 1895, and in the autumn of that year succeeded Lord Wolseley in the Irish command and was sworn a privy councillor.

After the disastrous actions in the Boer war in South Africa in December 1899 at Magersfontein, Stormberg and Colenso, where his only son was killed, Lord Roberts was sent out as commander-in-chief. He arrived at Cape Town on Jan. 10, 1900, and after organizing his force, advanced with sound strategy on Bloemfontein, the capital of the Orange Free State, and soon changed the aspect of affairs. The sieges of Kimberley and Ladysmith were raised, and the Boer general, Cronje, flying towards the capital, was overtaken at Paardeberg and, after a fine defence, compelled to surrender, with 5,000 men, on the anniversary of Majuba Day, Feb. 27, 1900. Roberts entered Bloemfontein on March 13, and after six weeks' preparation, advanced on Pretoria, the capital of the Transvaal. Mafeking was relieved on May 17, and Pretoria occupied on June 5. The two Boer states were annexed, and the war gradually assuming a guerrilla character, Roberts handed over the command to Lord Kitchener and returned to England to fill the office of commander-in-chief of the army in succession to Lord Wolseley.

On his return in 1901 he received an earldom, the thanks of both Houses of Parliament and a grant of £100,000 for his services in South Africa. In 1905 he resigned his post on the Committee of National Defence, and devoted himself to attempting to rouse his countrymen to the necessity of cultivating rifle-shooting and of adopting systematic general military training and service.

As head of the National Service League, he took part in the movement in favour of compulsory military service for home defence and published in 1911, *Follies and Facts*, in support of

his views. On the outbreak of the World War he was a frequent visitor at the War Office, and shortly after the arrival of the two Indian divisions in France he crossed the Channel to visit them in the trenches. He was attacked by pneumonia while at the front, and he died at St. Omer on Nov. 14, 1914, the title going by special remainder to his elder daughter, Aileen Mary. He was buried in St. Paul's Cathedral, London.

Earl Roberts was the author of the following works: *The Rise of Wellington* (1895); *Forty-one years in India* (1897); *Letters written during the Indian Mutiny* (1924). See also H. Henson, *The Afghan War of 1879-1880* (1881); *The Anglo-Afghan War* (official account, 1881); Sir T. F. Maurice and M. H. Grant (Official), *History of the War in South Africa 1899-1902* (1906-1910); Sir G. W. Forrest, *The Life of Lord Roberts* (1914).

ROBERTSON, FREDERICK WILLIAM (1816-1853). English divine, known as Robertson of Brighton, was born in London on Feb. 3, 1816. He studied at Edinburgh university, and at Brasenose college, Oxford. He had intended to go into the army, but Oxford changed the bent of his mind, and he was ordained in 1840, and served in curacies at Winchester and Cheltenham. He entered in 1847 on his famous ministry at Trinity Chapel, Brighton, where his church was thronged with thoughtful men of all types. Robertson was not a scientific theologian; but his insight into the principles of the spiritual life was unrivalled. As his biographer says, thousands found in his sermons "a living source of impulse, a practical direction of thought, a key to many of the problems of theology, and above all a path to spiritual freedom." His closing years were full of suffering, arising mainly from the opposition aroused by his sympathy with the revolutionary ideas of the 1848 epoch. He died on Aug. 15, 1853.

Robertson's works include 5 vols. of sermons, 2 vols. of expository lectures, on Genesis and on the epistles to the Corinthians, a volume of miscellaneous addresses, and an *Analysis of "In Memoriam."* See Stopford A. Brooke, *Life and Letters* (1885).

ROBERTSON, THOMAS WILLIAM (1829-1871), English actor and dramatist, was born at Newark on Jan. 9, 1829. Robertson was familiar with the stage from his childhood; he was the eldest of a large family, the actress Margaret (Madge) Robertson (Mrs Kendal) was the youngest. A farcical comedy by him, *A Night's Adventure*, was produced, without great success, at the Olympic, under Farren's management as early as 1851. He remained for some years longer in the provinces, varying his work as an actor with miscellaneous contributions to newspapers. In 1860 he went to London, and edited a mining journal. He was at one time prompter at the Olympic under the management of Charles Mathews. He wrote a farce entitled *A Cantab*, which was played at the Strand theatre in 1861. This brought him a reputation in a Bohemian clique, but so little practical assistance that he thought of abandoning the profession to become a tobaccoist. Then, in 1864, came *David Garrick*, produced at the Haymarket with Edward Sothman in the principal character, which has kept the stage ever since.

But his name was made by the production of *Society* at the Prince of Wales Theatre in 1865, under the management of Miss Marie Wilton, afterwards Mrs. Bancroft. Play-writer and company were exactly suited one to another; the plays and the acting together—the small size of the playhouse being also in their favour—were at once recognized as a new thing. Although some critics sneered at the "cup-and-saucer comedy," voted it absurdly realistic, said there was nothing in it but commonplace life represented without a trace of Sheridanian wit and sparkle, all London flocked to the little house in Tottenham Street, and the stage was at once inundated with imitations of the new style of acting and the new kind of play. All Robertson's best known plays (except *David Garrick*) were written for the old Prince of Wales's under the Bancrofts, and that régime is now an historical incident in the progress of the English stage. *Ours* was produced in 1866, *Caste* in 1867, *Play* in 1868, *School* in 1869, *M.P.* in 1870. Robertson died in London on Feb. 3, 1871.

See *Principal Dramatic Works of Robertson; with Memoir by his son* (1889); and T. E. Pemberton, *Life and Writings of Robertson* (1893).

ROBERTSON, WILLIAM (1721-1793), Scottish historian, born at Borthwick, Midlothian, on Sept. 19, 1721, was the eldest

son of the Rev. William Robertson. He was educated at the school of Dalkeith and the University of Edinburgh. In 1743 he was presented to the living of Gladsmuir in East Lothian. His services in the '45 were rewarded by his election as a member of the General Assembly, where his influence as leader of the "moderate" party was for many years nearly supreme. (See PRESBYTERIANISM.)

Robertson's *History of Scotland during the Reigns of Queen Mary and of James VI. until his Accession to the Crown of England* begun in 1753, was published in two volumes in 1759 (19th ed. 1812). Before the end of the author's life the book had reached its 14th edition; and it soon brought him other rewards than literary fame. In 1759 he was appointed chaplain of Stirling castle, in 1761 one of His Majesty's chaplains in ordinary, and in 1762 he was chosen principal of the University of Edinburgh. In May 1763 he was elected Moderator of the General Assembly, and in August king's historiographer. His other works were: *History of the Reign of the Emperor Charles the Fifth* (3 vols., 1769) which had a European reputation and was translated into French in 1771, German, 1770-71, Italian, 1835, and Spanish, 1846; *History of America* (2 vols., 1777); *Disquisition concerning the Knowledge which the Ancients had of India* (1791).

There are lives of Robertson by Dugald Stewart (Edinburgh, 1801 and 1802), prefixed to most of the collective editions of his works; by George Gleig, bishop of Brechin (Edinburgh, 1812); and by Lord Brougham in *Lives of Men of Letters*, etc. (1845-1846). Robertson's works were edited with a life by D. Stewart (8 vols., 1871) and were translated into French in 12 vols. (1829) by J. B. Suard and others.

ROBERTSON, SIR WILLIAM ROBERT (1886-1933), British field marshal, was born at Welbourn, Lincs., on Sept. 14, 1886. He enlisted as a private in the 16th Lancers in 1897, and served in the ranks of that regiment until 1888, when he won a commission in the 3rd Dragoon Guards, then in India. He eagerly studied his profession in all its branches and he learned the native languages. He was railway staff officer in the Miranzai and Black Mountain operations of 1891, and in the following year joined the intelligence department at Simla; while on its staff he carried out a reconnaissance to the Pamirs, and in 1895 served with the Chitral Relief Force, being wounded and receiving the D.S.O. He passed through the Staff College in 1897-8—the first officer risen from the ranks to do so—and then, after a few months at the War Office, went out to South Africa on the Intelligence Staff; he accompanied Lord Roberts on his advance from Cape Colony into the Transvaal, and was promoted brevet lieutenant-colonel for his services. He spent the period from 1901 to 1907 at the War Office, being promoted colonel in 1903, and he then went to the staff at Aldershot, where he spent three years. In 1910 he was appointed commandant of the Staff College, was shortly afterwards promoted major-general and in 1913 became director of military training at the War Office.

On the mobilization of the army for the World War, Robertson became quartermaster-general of the Expeditionary Force, and in Jan. 1915 chief of the general staff to Sir John French. In the following December he was brought back to the War Office as chief of the imperial general staff and immediately introduced great improvements in the office organization. Convinced that the Western Front represented the decisive theatre of war, and fully aware how mischievous was dispersion of force in principle, he saw to it that, where operations in distant regions were unavoidable, the commanders on the spot were furnished with what was deemed essential to achieve success—with the result that the position of affairs in Mesopotamia, on the Suez frontier and in East Africa was completely transformed within a very few months. His services were recognized by promotion to general in 1916 and by the G.C.B. in 1917.

In the latter months of 1917 he found it more and more difficult, in view of the disappointing results of Allied offensives in France and Flanders, to persuade the War Cabinet that diversion of fighting resources to other theatres of war endangered prospects of victory at the decisive point and might lead to disaster near home. His anxieties were increased by the manner in which the problem of man-power was treated. He moreover foresaw that the Su-

preme War Council, introduced towards the end of the year, would not provide effective means for combining the operations of the Allies. In Feb. 1918 he was transferred by the Government to the charge of the eastern command in England—just one month before the success that attended the great German offensive of March proved how correct had been his appreciation of the situation. Three months later he succeeded French as commander-in-chief in Great Britain. After the War he received a baronetcy, a grant of £10,000, and in 1919, the G.C.M.G. From April 1919 to March 1920 he commanded the British troops on the Rhine, and after relinquishing that appointment on the force being reduced, was promoted field-marshal. Robertson received many English and foreign honours, including the G.C.V.O. (1931).

See his *From Private to Field-marshal* (1931); and *Soldiers and Statesmen 1914-1918* (1926).

ROBERT THE DEVIL, hero of romance. He was the son of a duke and duchess of Normandy, and by the time he was 20 was a prodigy of strength, which he used, however, only for outrage and crime. At last he learnt from his mother, in explanation of his wicked impulses, that he was born in answer to prayers addressed to the devil. He was directed by the pope to a hermit, who imposed on him by way of penance that he should maintain absolute silence, feign madness, take his food from the mouth of a dog, and provoke ill-treatment from the common people without retaliating. He became court fool to the emperor at Rome, and delivered the city from Saracen invasions in three successive years in the guise of an unknown knight, having each time been bidden to fight by a celestial messenger. The emperor's dumb daughter recovered speech to declare the identity of the court fool with the deliverer of the city, but Robert refused the hand of the princess and the imperial inheritance and ended his days in the hermitage of his old confessor. The French romance of *Robert le Diable* is one of the oldest versions of the legend. The story had undergone much change before it was used by E. Scribe and C. Delavigne in the libretto of Meyerbeer's opera of *Robert le Diable*.

See *Robert le Diable*, ed. E. Læsteh (Soc. des anc. textes fr., 1903); *Sir Gower*, ed. K. Breul (Oppeln, 1888); M. Tardel, *Die Sage v. Robert d. Teufel in neueren deutschen Dichtungen* (1900); L. A. Hibbard, *Medieval Romance in England* (1924).

ROBERT THE STRONG (le Fort) (d. 866), count of Anjou and of Blois, appears as rector of the abbey of Marmoutier in 852, and as one of Charles the Bald's *missi dominici*, in 853; but soon afterwards he was among those who rebelled against Charles, and invited the king's half-brother, Louis the German, to invade West Francia. In 860 Robert came to terms with Charles, who made him count of Anjou and of Blois, and entrusted him with the defence of that part of his kingdom which lay between the Seine and the Loire, a district which had suffered greatly from the ravages of the Normans and the Bretons. He was killed in battle at Brissarthe in October 866, leaving two sons, Odo, or Eudes, and Robert, both of whom became kings of the Franks. Robert was the ancestor of the Capetian kings of France.

See K. von Kalkstein, *Robert der Tapfere* (1871); and E. Favre, *Eudes, comte de Paris et roi de France* (1893).

ROBERVAL, GILLES PERSONNE (or PERSONIER) DE (1602-1675), French mathematician, was born at Roberval, near Beauvais, on Aug. 8, 1602. In 1632 he became professor of mathematics in the Collège de France. He died in Paris on Oct. 27, 1675. Roberval studied the quadrature of surfaces and the cubature of solids, which he accomplished, in some of the simpler cases, by an original method which he called the "Method of Indivisibles." He discovered a general method of drawing tangents, by considering a curve as described by a moving point whose motion is the resultant of several simpler motions. He also discovered a method of deriving one curve from another, by means of which finite areas can be obtained equal to the areas between certain curves and their asymptotes. To these curves, which were also applied to effect some quadratures, Evangelista Torricelli gave the name of "Robervallian lines."

Gilles Personne de Roberval invented the balance which goes

by his name.

His works were published in 1693 by the Abbé Gallois, in the *Recueil de Mémoires de l'Académie des Sciences*.

ROBES, the name generally given to a class of official costume, especially as worn by certain persons or classes on occasions of particular solemnity. The word robe was earliest used, in the sense of a garment, of those given by popes and princes to the members of their household or their great officers. It would be going too far to assume that, e.g., peers' robes were originally the king's livery, but in most early cases where robes are mentioned, if not of cloth of gold, etc., they are of scarlet, furred. A robe is properly a long garment, and the term "robes" is now applied only in those cases where a long garment forms part of the official costume, though in ordinary usage it is taken to include all the other articles of dress proper to the costume in question. The term "robes" moreover, connotes a certain degree of dignity or

Mass; yet the rochet and chimere of an English bishop, even in church, are more properly referred to as robes than as vestments, and while the cope he wears in church is a vestment rather than a robe, the scarlet cope which is part of his parliamentary full dress is a robe, not a vestment. The official, non-liturgical costume of the clergy is dealt with under the general heading **VESTMENTS** and the subsidiary articles.

The coronation robes of emperors and kings, representing as they do the sacerdotal significance of Christian kingship, are essentially vestments rather than robes. Apart from these, however, are the royal robes of State; in the case of the king of England a crimson velvet surcoat and long mantle, fastened in front of the neck, ermine lined, with a deep cape or tippet of ermine. The sovereign's coronation robes are described in "The King's Coronation Ornaments," by W. St. John Hope, in *The Ancestor*, vols. i. and ii., also by L. Wickham Legg, *English Coronation Records* (1901).

All countries, East and West, which boast an ancient civilization have some sort of official robes, and the tendency in modern times has been to multiply rather than to diminish their number. In the United States few save Federal judges wear robes. The scarlet judicial robes were discarded at the Revolution. Those of black silk now worn are slightly modified academic gowns. John Jay, first chief justice of the Supreme Court (1789), set the fashion by sitting in the LL.D. gown granted him by Columbia university. The present article does not attempt to deal with any but British robes, under the headings of (1) peers' robes, (2) robes in the House of Commons, (3) robes of the Orders of Knighthood, (4) judicial and forensic robes, (5) municipal and civic robes, (6) academic costume.

Peers' Robes.—As early as the end of the 14th century peers seem to have worn at their creation some kind of robe of honour. An illumination on the foundation charter of King's college, Cambridge, represents the peers in 1446 wearing gowns, mantles and hoods of scarlet, furred with miniver, the mantle opening on the right shoulder and guarded with two, three or four bars of miniver, in the form of short stripes high up on the shoulder. The origin of these is as yet unknown, and it is not certain precisely when the peers' velvet robe of estate was first used. During the reign of Henry VIII., references are found to the "parliament robes" of peers. By the time of James II.'s coronation, the baron and viscount had the velvet robes of estate. The colour of these seems to have been crimson at first, sometimes varying to purple. They consisted of a long gown or surcoat with girdle, a mantle lined with ermine, a hood and tippet of ermine, the rows being as follows: for a duke 4, a marquess 3½, an earl 3, a viscount 2½ and a baron 2.

Till late in the 18th century peers continued to attend the House of Lords in parliamentary robes, with the stars and ribbons of their orders, but robes are now only worn in the House of Lords, e.g., at the opening of parliament, on occasions when the sovereign gives his assent to bills by "royal commission" (when five or six peers on the Government side appear in robes, and the lord chancellor also wears his peer's robe of scarlet ermine), and at the introduction of a newly created peer, when the new peer and his two introducers wear their parliamentary robes (over morning dress) during the ceremony of introduction only. The mover and seconder of the Address no longer wear robes, but uniform. On all the above occasions, and when the peers as a body attend church or some other ceremony, the parliamentary robe of scarlet cloth is worn; in the present day it takes the form of a mantle opening on the right shoulder, with a collar of ermine, and guarded with rows of ermine and gold lace round the right shoulder, varying in number according to the rank of the wearer. The modern coronation robes consist of a crimson velvet surcoat and a mantle with a tippet of ermine and with rows of ermine as in the parliamentary robes. The surcoat is no longer a gown, but a short sleeveless garment.

As regards peeresses' robes, the order of the earl-marshal for the regulation of these at the coronation of James II. shows that by then all peeresses wore the robes of state of crimson velvet, and minutely regulates all details, such as shape, powderings, length of train and width of the fur edging of the mantle. They have changed very little up to the present day.

House of Commons.—The speaker of the House of Commons wears on state occasions a black damask robe with gold lace and a full-bottomed wig; in the House itself he wears a black silk robe with train and a full-bottomed wig. The clerks at the table wear barristers' gowns and wigs.

Robes of the Orders of Knighthood.—The robes of the Garter were originally of blue woollen stuff, the surcoat and hood being powdered with garters embroidered in silk and gold. The surcoat varied in colour from year to year; the hood was made of the same material as the surcoat and, when hats began to be worn, was carried hanging over the shoulder. Robes were sometimes granted to ladies in the early days. The last lady to receive the robes was Margaret, countess of Richmond, in 1488. At the present day the mantle is of dark blue velvet, of the same colour as the ribbon, lined with taffeta, and with the star embroidered on the left shoulder, the hood and surcoat of crimson velvet lined with white taffeta, and with these are worn a doublet and trunk-hose of white satin and a plumed hat.

The robes worn by the knights of the Bath created at the coronation of Henry IV. were green with furred hoods, and a white silk cord hanging from the left shoulder. The mantle in the present day is of crimson velvet lined with white over a white satin under-coat and trunk-hose, and a plumed hat and white boots with red tops are worn. The mantle of the Thistle is of dark green velvet over surcoat, etc. of cloth of silver; that of St. Patrick azure, with doublet and trunk-hose of white satin; that of St. Michael and St. George of Saxon blue satin lined with scarlet; and that of the Star of India of light blue satin lined with white.

Judicial and Forensic Robes.—It is frequently stated that judicial robes had their origin in the dress of ecclesiastics. But though ecclesiastics in early days frequently acted as judges, and though, as Fortescue says, the serjeant's long robe was "after the fashion of a priest," judicial robes more probably arose from the ordinary civilian dress of the early 14th century. The chief argument for the ecclesiastical origin has been found in the coif, a cap of white linen or silk, tied under the chin, and described by Fortescue as "the principal or chief insignism and habit wherewith serjeants-at-law at their creation are decked," which is said to have been used by ecclesiastics to hide the tonsure when in court. More probably the coif was a head-dress in common use in the 13th century, which survived as the distinguishing mark of men of law.

About the time of Queen Elizabeth the square cap, otherwise known as the cornered, black or sentence cap (the last from the

fact of its being put on by the judge when pronouncing sentence of death, began to appear. Sometimes it was worn over the coil only, sometimes over the coil and skullcap. Sometimes it had ear flaps, sometimes, as in its present form, it had not.

Toward the end of the 17th century the judges took to wearing wigs, and they have continued to wear them ever since. The wearing of wigs naturally concealed the coil and velvet skullcap, so a device had to be invented by which they could still be displayed. The expedient was hit upon by putting a round patch of white stuff, with a black spot in the middle of it, on the crown of the wig of certain of the judges, to represent the coil and skullcap. Sergeant being appointed no longer, this round patch has now disappeared, the only trace of it left being a circular depression on the crown of the wig. Minute details of court and levee dress, judicial and legal, of the present day, will be found in *Dress Worn at Court* (pp. 60-61), issued with the authority of the lord chamberlain—also details of judicial costume.

Municipal and Civic Robes.—The word "ivery" the use of which is now practically confined to the costume of the "ivery companies," the dress of men servants, etc., originally meant an allowance of food or clothing granted to certain persons. It is still used of the allowances of food made to the fellows of certain colleges. As early as the 13th century, the citizens of London used to assume a uniform dress to do honour to some great occasion, as when 600 citizens rode out to meet Queen Margaret, wife of Edward I, "in one livery of red and white, with the cognizances of their mysteries embroidered upon their sleeves." By the 14th century there is evidence of the adoption of liveries by the trades and fraternities, and when the livery companies were incorporated they took care to have their liveries authorized by their charters. As to the costume of the mayor, aldermen, sheriffs, etc., the scarlet, violet and black robes, still worn by them, were early in use. The provincial mayors and aldermen at quite an early date followed the fashion of London. An account of the robes of modern provincial mayors will be found in St. John Hope's *Corporation Plate and Insignia*.

At the present day the lord mayor has several sets of robes; a special coronation robe, a crimson velvet robe of state like that of an earl, worn with the chain and jewel, e.g., in the presence of the sovereign when in the city; a black robe of state trimmed with gold, which is worn with the chain and jewel, e.g., at the Guildhall on lord mayor's day; the scarlet robes, which are worn, with or without the chain, on most public occasions, such as the service at St. Paul's on the first day of the Easter law term, audiences of the sovereign, the election of the lord mayor, the opening of the central criminal court, etc.; a violet gown, which is worn, e.g., when the lord mayor elect is presented to the king, when he is sworn in, at the election of sheriffs, etc., and a black gown worn in church on Good Friday, etc. The aldermen wear scarlet on most occasions of ceremony, former mayors "having the Cap of dignity attached to their gown, and being entitled to introduce a sword and march into their badges." Violet robes are also worn on certain occasions marked in the almanac of the *Aldermen's Pocket-Book*, and black gowns when the lord mayor wears his. The sheriffs and recorders have scarlet, violet and black gowns, and the members of the common council have deep mazarine blue gowns, which seem to have been first prescribed in 1761.

Academical Dress.—Like judicial robes, academical dress has been considered to be of ecclesiastical origin. The mediaeval scholar was, of course, a clerk and had to wear the clerical gown and the tonsure. The

statutes of the universities of Oxford and Cambridge, and the

statutes of the universities of Oxford and Cambridge, and the

statutes of the universities of Oxford and Cambridge, and the

statutes of the universities of Oxford and Cambridge, and the

budge (common fur or black lamb's wool); students and even doctors in theology were also, at one time, restricted to budge, lamb's wool and to sombre habits. The robes of masters had to be flowing and reach to the ankles, and it was the masters who had the earliest distinctive dress that could be called truly academical.

The cope, *i.e.*, the *capa* or *capa clausa*, the closed and essentially ecclesiastical cope or cape, not to be confused with the open and purely decorative cope of the clergy) probably originated in the ordinary everyday mantle of the clergy. Its wear in England was made obligatory by Cardinal Archbishop Stephen Langton, 1172, at the provincial synod held at Osney abbey, near Oxford. All bishops, deans, archdeacons, rural deans, priests and all church dignitaries were ordered to wear it.¹ This kind of cope, closed in front, was originally black; it sometimes, for the sake of convenience, had a slit in front to allow of the passage of the hands, this type of opening being the form or variation adopted by the doctors in theology and retained by them until the present day, although later on the slit was extended to the ground. Another variation was to make two side slits, one for each arm, a variation (the *pallium* or *chimaera*) adopted by the doctors in law and in physic and by the superior bachelors; *i.e.*, the bachelors in canon law, physic and possibly in theology. This type is the forerunner of the "convocation habit" and "ecclesiastico-academical chimere".

About 1330-40 doctors began to adopt scarlet for their hoods, and later for their robes; at any rate by about 1500, probably long before, all doctors wore scarlet and had discarded their black *capae clausae* for scarlet ones, the original sombre, black form being retained by the M.A.'s and B.A.'s. The wearing of robes of scarlet, violet or murrey, and also the "sleeveless cote" (*i.e.*, convocation habits and chimeres), *super tunica*, of these colours, was formally ratified by an act of 24 II. VI.

chancoer, and Anthony a Wood, M.A., antiquary. Eventually (from about 1760 onwards) in the time of George III. and Duke of Gloucester, the silk-lined hood was the type principally retained by masters and doctors, the miniver-lined hood being preserved as a proctorial insignia only. At a later date, at Cambridge, a distinction was made between the hoods of nonregent masters, which were lined with silk, and those of regent masters, which were lined with miniver. The regents wore their hoods in such a way as to show the white lining, while the nonregents wore theirs "squared," so that the white did not show. Hence the name "white hoods" and "black hoods" given to the upper and lower houses of the old senate respectively. It is not settled when the modern colouring of hoods arose; they probably followed those of the robes of the faculties, but about these there is equal uncertainty. The Oxford proctor still wears a miniver hood. The modern Cambridge hood has preserved the original shape more closely than the Oxford M.A. type, being a hood and cape combined, the cape having, incorrectly, square corners.

There seem to have been in Tudor times at least three varieties of academical headdress, one, the round cap of velvet for graduates in the secular faculties, survives as part of the full dress of doctors (except doctors in theology) to the present day. The square cap was adopted at the universities, according to N. P. Richardson, after 1350, in imitation of the University of Paris. In this connection should be mentioned the term "tuffbunting" (*i.e.*, attempting to thrust oneself into the society of one's social superiors), derived from the gold tufts or tassels worn by noblemen and fellow commoners on their college caps. Originally, in the two ancient English universities, no one wore a cap except doctors in the superior faculties of theology, canon law and physic.

The type of cap they wore was a tight round skullcap type, with a little point at the crown: it was called the "pileus" and was thus a cap of dignity. All other graduates and nongraduates had their hoods, which were thus a shoulder cape and a covering for the head. It appears that in Paris caps were made by sewing four pieces of cloth together, and the seams produced little raised ridges, and had a squaring effect. From this particular cap (squaring in effect), two types of cap evolved. (1) the brette or priest's cap, simply a stiffened, rather taller pileus, made of the four pieces of cloth, and (2) the academical or doctor's cap (*pileus quadratus*), a velvet cap of dignity for doctors in theology.

Doctors in the secular faculties adopted in the early Tudor period a soft round lay cap of velvet (*pileus rotundus*). Foundation choristers and scholars were permitted square caps in 1549. Between 1549 and 1580 there were frequent rulings and fresh statutes issued on the subject of caps. B.A.'s and other junior graduates were not authorized to wear caps until between 1575 and 1580, and then only "humbly and submissively in the Schools." By 1580 a cap had been established for all members of the two ancient English universities,

the 28th canon.

¹E.g., King's college, Cambridge, 1344, statutes nos. xxiii and xxv, quoted by E. T. Beaumont in his *Academical Habit*, p. 4 (Oxford, 1928).

²E.g., Merton 1270, Queen's 1340 and All Souls 1445; *ibid.*, p. 3.

³The 28th canon.

and the restriction to doctors and senior graduates had broken down. The beautiful series of illustrations of the academic dress at Oxford, by George Edwards and by David Loggan, 1674 and 1675, show the caps then in use.

Academic dress underwent much inquiry and some revision at the time of the Reformation, chiefly in the direction of sobriety, uniformity and laicization, "excess of apparel" being regarded as severely as ever, but not with much more effect. There have been few far-reaching changes since the Laudian code of 1636. Cambridge in the 20th century inquired into and revised its regulations as to dress, and in the *Ordinances* (latest ed. 1908, statute A, ch. vii, p. 303) clear rules are laid down, again revised and systematized on Feb. 28, 1934 (*Ordinances of the Univ.*); the Oxford regulations (see *Statuta et Decreta Univ. Oxon.* 1909, tit. xiv, de vestitu et habitibus, pp. 327-328) have not even been revised in modern times, not in fact since 1770, and have now fallen into chaos. Some of them are dead letters: at Oxford one hood (the pale blue B.Litt. hood of 1895) by 1946 had come to be worn for four degrees, B.C.L., B.M., B.Sc. and B.Litt. The dark blue hood, lined with white fur, proper to the B.C.L. and B.M. degrees, was no longer to be seen at Oxford. The modern robe makers sell the pale blue silk B.Litt. hood, lined with white fur, for all four degrees and for the B.Phil.

Doctors of both universities have three sets of robes: first, the full-dress robe of ermine cloth; second, the ermine-trimmed robe of damask; and third, the robe of black velvet. The full-dress robe of ermine cloth is worn by the doctors of both universities at the University of Oxford, and by the doctors of the University of Cambridge at the University of Cambridge. The robe of damask is worn by the doctors of both universities at the University of Oxford, and by the doctors of the University of Cambridge at the University of Cambridge. The robe of black velvet is worn by the doctors of both universities at the University of Oxford, and by the doctors of the University of Cambridge at the University of Cambridge.

The Oxford sleeveless commoner's gown, though still by statute *toga talaris*, now reaches little below the waist, the full-sleeved or bell-sleeved scholar's gown to the knee. The tufted silk gown of the gentleman commoner and the nobleman's gold-lace gown are not yet abolished by statute, but have fallen into disuse. The University of Oxford act, 1834, brought in and passed by Gladstone, abolished these class distinctions at Oxford, although they lingered on until about 1860 at Christ Church, so that King Edward VII, then prince of Wales, wore a gentleman commoner's bell-shaped velvet gown when up in 1860-62. Vice-chancellors have no official costume, but wear the robes of their degree. The chancellors of the older universities wear a black damask silk robe with gold lace and a black velvet square cap with gold tassel and band; those of the newer universities have had robes "created" by the robe makers, who are nowadays to a large extent the arbiters of academic dress, but based on Oxford and Cambridge customs largely.

United States.—An Intercollegiate commission in 1893 drafted a uniform code for academic caps, gowns and hoods which has since been accepted by 700 to 800 colleges and universities in the United States. Three types of gown and three types of hood have been devised for bachelors, masters and doctors, respectively. The square caps remain the same except the doctor's may be made of velvet and have a tassel of gold. The bachelor's gown is made of black worsted material and may be distinguished by its pointed sleeves of the B.A. Oxford type, though hanging only to the knee. The master's gown, made of silk, has closed sleeves of M.A. type (the arm coming through a slit at the elbow), which are square at the end and extend well below the knee. The doctor's gown is also made of silk, and, like a judge's robe, has full, open bell-shaped sleeves, is faced with velvet and has three bars of velvet on each sleeve. The hoods are lined with silk with the colour or colours of the college or university granting the degree and trimmed with velvet of the colour that represents the department of learning in which the degree was obtained. The velvet trimming of the doctor's gown may also be of the departmental colour or it may be black if preferred. Colours of the more common departments of learning are as follows: arts and letters, white; theology and

divinity, scarlet; laws, purple; philosophy, blue; science, golden yellow; medicine, green; dentistry, lilac; music, pink; engineering, orange. A few institutions notably Harvard, repeat an individual code for their faculty. The U.S. Intercollegiate code has provided a similar set of hoods for holders of continental and other foreign degrees.

ROBESON, PAUL (1898-), U.S. Negro actor and singer, was born at Princeton, N.J., on April 9, 1898. He graduated from Rutgers college with the highest scholastic average in the college's history, in addition to being a five-letter man in athletics and All-American football end for two successive years. In 1923 he completed the law course at Columbia university. His first stage appearance was in *Toboo* (1922), but he made his reputation with his creation of the role of Jim Harris in *All God's Chilluns Got Wings* and his playing of the title roles in *The Emperor Jones* (1923) and *Black Boy* (1926). He played a short time in *Show Boat* in New York and in 1928 played in it in London. Turning then to the concert stage with regals of Negro spirituals, he made successful tours of the U.S., Europe and the U.S.S.R. He also sang on the radio and in motion pictures. In 1950 the U.S. state department voided the passport of Robeson, who had supported various Communist causes and "peace" movements.

ROBESPIERRE, MAXIMILIEN FRANÇOIS MARIE ISIDORE DE (1758-1794), French revolutionist, the son of an advocate, was born at Arras on May 6, 1758. His family, according to tradition, was of Irish descent. Maximilien was one of four orphan children who were left in the care of relatives when their father left Arras. His direct ancestors in the male line had been notaries at the village of Carvin near Arras from the beginning of the 17th century. His grandfather, being more ambitious, established himself at Arras as an advocate, and his father followed the same profession, marrying Jacqueline Marguerite Carraut, daughter of a brewer in the same city, in 1757. Of this marriage four children were born, two sons and two daughters, of whom Maximilien was the eldest; but in 1767 Madame Derobespierre, as the name was then spelled, died, and the disconsolate widower at once left Arras and wandered about Europe until his death at Munich in 1766. Maximilien was sent to the college of Arras and the college of Louis-le-Grand at Paris. Here he had for fellow pupils Camille Desmoulins and Stanislas Fréron. Admitted an advocate in 1781, Robespierre returned to his native city to seek for practice. His reputation had already preceded him, and the bishop of Arras, De Conzié, appointed him criminal judge in the diocese of Arras in March 1782. This appointment, which he soon resigned to avoid pronouncing a sentence of death, did not prevent his practising at the bar, and he speedily became a successful advocate. He now turned to literature and society, and came to be esteemed as one of the best writers and most popular dandies of Arras. He was a member of an Arras literary and musical society known as the "Rosati," of which L. N. M. Carnot was a member. The sympathetic quality of his voice won for him

¹Confirmed by act of parliament, 34 Henry VIII, ch. 13, and authorized for all doctors and for B.D.'s.

²Confirmed in the Laudian code, 1636.

ROBIN HOOD, English legendary hero. The oldest datable mention of Robin Hood at present known occurs in the second edition of *Piers Plowman*, the date of which is about 1377. In that poem the figure of Sloth is represented as saying:

"I can nou3te perfly my pater-noster, as
the prest it syngeth:
But I can rymes of Robyn Hood and Randolf
Ere of Chestre."

He is next mentioned by Andrew of Wyntoun in his *Original Chronicle of Scotland*, written about 1420. Of his popularity in the latter half of the 15th and in the 16th centuries there are many signs. In the Elizabethan era and afterward mentions abound. Of the ballads themselves, *Robin Hood and the Monk* is possibly as old as the reign of Edward II (see Thomas Wright's *Essays on England in the Middle Ages*, II, 174); *Robin Hood and the Potter* and *Robyn and Gandelyn* are certainly not later than the 15th century. Most important of all is *A Lyttell Geste of Robyn Hode*, which was first printed about 1530 (see A. W. Pollard's *Fifteenth Century Prose and Verse* [1903]). This is evidently founded on older ballads; we read in *The Seconde Pytte*, II, 176 and 177:

"He wente hym forthe full mery synygnye,
As men have told in tale."

In fact, it does for the Robin Hood cycle what a few years before Sir Thomas Malory had done for the Arthurian romances.

These are the facts about him and his balladry. Of conjectures there is no end. He has been represented as the last of the Saxons—as a Saxon holding out against the Norman conquerors as late as the end of the 12th century (see Augustin Thierry's *Norman Conquest*, and compare Sir Walter Scott's *Ivanhoe*). J. M. Gutch maintains that he was a follower of Simon de Montfort. The Robin Hood story has probably some historical basis. Sloth in Langland's poem couples him with Randle, earl of Chester, whom we believe to have been the third Randle (see Bishop Thomas Percy's folio manuscript, ed. Hales and Furnivall, I, 260 [1867-68]); and, possibly enough, Hood was contemporary with that earl, who flourished in the reigns of Richard I, John and Henry III. His myn was, as is evident from what we have already said, full grown in the first half of the 14th century.

That the Robin Hood story attracted to it and appropriated other elements is illustrated by its subsequent history. Thus later on we find it connected with the Morris dance; but the Morris dance was not known in England before the 16th century or late in the 15th. The Maid Marian (q.v.) element has been thought to have been introduced for the purpose of these performances, which were held on May day and were immensely popular (see Hugh Latimer's *Frutefull Sermons* [1571], p. 75; also *Paston Letters*, ed. J. Gairdner, III, 89). After 1615, the date of the pageant prepared for the mayoralty of Sir John Jolles, draper, by Anthony Munday and entitled *Metropolis Coronata*, the yeoman of the older version was metamorphosed into the earl of Huntingdon, for whom in the following century William Stukeley discovered a satisfactory pedigree. The earl of Huntingdon was probably a nickname for a hunter. The rise, development and decay of the myth deserve thorough study.

What perhaps is its greatest interest is its expression of the popular mind about the close of the middle ages. Robin Hood was at that time the people's ideal, as Arthur is that of the upper classes. He is the ideal yeoman, as Arthur is the ideal knight. He re-adjusts the distribution of property; he robs the rich and endows the poor. He is an earnest worshipper of the Virgin, but a vigorous hater of monks and abbots. He is the great sportsman, the incomparable archer, the lover of the greenwood and of a free life, brave, adventurous, jocular, open-handed, a protector of women. The story is localized in Barnsdale and Sherwood; i.e., between Doncaster and Nottingham. In Yorkshire, Nottinghamshire and Lincolnshire a host of place names testify to the popularity of the Robin Hood legend—Robin Hood's Bay, Robin Hood's cave, Robin Hood's chase, Robin Hood's cup (a well), Robin Hood's chair and many more.

The best collections of Robin Hood poems are those of J. Ritson (1795), F. J. Child in the 5th volume of his *English and Scotch*

Popular Ballads (1888); and F. Jackson, *Popular Ballads of the Olden Time*, 4th series (1912). See also F. B. Gummere, *Old English Ballads* (1894). The versions in the Percy folio, ed. by Hales and Furnivall, vol. I (1867), are unhappily mutilated; but they should be consulted, for some are of a unique character, and that on "Robin Hood's death" is of singular interest. The earliest "Gauland" was printed in 1670, and in 1678 appeared a prose version which was reprinted by W. J. Thomas in his *Early English Prose Romances*, vol. II (1858). Sir S. Lee's memoir in the *Dictionary of National Biography* is extremely erudite, and two valuable articles, contributed by Sir E. Brabrook to the *Antiquary* (June and July 1906) must be consulted. See also W. Stukeley, *Palaographia Britannica*, no. I, 115 (1795); A. Thierry, *Conquête de l'Angleterre* (1810); J. Hunter, *Great Hero of the Ancient Minstrelsy of England*, *Robin Hood* (1852).

ROBIN HOOD'S BAY, a fishing town and seaside resort in the parish of Fylingdales, North Riding of Yorkshire, Eng., 6½ mi. S.E. of Whitby by the North-Eastern Region railway. The bay is a shallow indentation of the coast, fringed with a line of high cliffs which is broken in places by steep-sided gullies. On the adjoining moor are prehistoric British tumuli popularly called Robin Hood's Butts.

ROBINIA, or **LOCUST**, a genus of about 15 species natives of North America and Central America, belonging to the family Leguminosae. The best-known species (*R. pseudoacacia*) was introduced into Europe in 1636. This tree, the black locust, often

erroneously called acacia, is now widely cultivated as an ornamental tree in Europe. It grows from 30 to 60 ft. high, and bears long, graceful compound leaves with 9 to 17 bright-green oblong leaflets, and white fragrant flowers in loose pendulous racemes, recalling the laburnum. There are many varieties varying in the method of growth, the presence or absence of thorns (persistent spinose stipules) on the branches and the colour of the flower.

In the eastern United States, where it is native, it grows from 70 to 80 ft. high with a trunk 3 or 4 ft. in diameter. It is a valuable timber tree; the wood is heavy, hard, strong, close-grained and durable.

The clammy locust (*R. viscosa*), a tree sometimes 40 ft. high, with pinkish flowers, and the rose or moss locust (*R. hispida*), a small shrub, with showy rose-coloured flowers and hispid twigs, both native to the southeastern United States, are also cultivated for ornament.

The shipmast locust, a natural variety of black locust, is being used extensively by American foresters in reforestation projects, particularly in the shelter belt regions of the midwest.

ROBINSON, EDWARD (1794-1863), U.S. biblical scholar, was born in Southington, Conn., on April 10, 1794. In 1837 he became professor of biblical literature in Union Theological seminary, and left the U.S. for three years of study in Palestine and Germany, the fruit of which, his *Biblical Researches* (published simultaneously in England, Germany and the U.S. in 1841), brought him the gold medal of the Royal Geographical society in 1842.

Later Biblical Researches appeared in 1856. His plans to sum up his important topographical studies in a work on biblical geography were cut short by cataract in 1862 and by his death in New York city on Jan. 27, 1863. A great biblical scholar and exegete, Robinson must be considered the pioneer and father of biblical geography. His *Biblical Researches*, supplemented by the *Physical Geography of the Holy Land* (1865), were based on careful personal exploration and tempered by a thoroughly critical spirit, which was possibly at times too sceptical of local tradition.

Of scarcely less value in their day were Robinson's *Greek Har-*

mony of the Gospels (1845) and his *Greek and English Lexicon of the New Testament* (1836).

See H. B. Smith and R. D. Hitchcock, *The Life, Writings and Character of Edward Robinson* (1863); a biography of Mrs. Robinson was published, with a collection of her stories, in Leipzig (1874).

ROBINSON, EDWIN ARLINGTON (1869-1935), U.S. poet, was born at Head Tide, Me., Dec. 22, 1869. From the public schools of Gardiner, Me., he proceeded in 1891 to Harvard, but withdrew after two years. Most of his later life was spent in New York city, where he was for a time a subway inspector and, through Pres. Theodore Roosevelt's recognition of his merit, a clerical worker in the customs house. He received several awards of the Pulitzer prize for poetry.

His verse includes *The Torrent and the Night Before* (1896), *The Children of the Night* (1897), *Captain Craig* (1901), *The Town Down the River* (1910), *The Man against the Sky* (1916), *Merlin* (1917), *Lancelot* (1920), *The Three Taverns* (1920), *Avon's Harvest* (1921), *Collected Poems* (1921), *Roman Bartholow* (1923), *The Man Who Died Twice* (1924), *Dionysus in Doubt* (1925), *Tristram* (1927) and *Cavender's House* (1929). Experiments in a different medium are the prose plays *Van Zorn* (1914) and *The Porcupine* (1915). Robinson's work, of singularly uniform poetic excellence and of penetrating insight, gives him a foremost place among modern writers.

See biographical and critical monographs by Lloyd Morris (with a bibliography by W. Van R. Whitall, 1923), by B. R. Redman (1926) and by Mark Van Doren (1927).

ROBINSON, HENRY CRABB (1775-1867), English journalist and diarist, the son of a tanner, was born at Bury St. Edmunds on March 13, 1775. He travelled much on the continent of Europe, and acted as special war correspondent for the *Times* in 1807-08. From 1813 to 1828 he practised at the bar. He is remembered chiefly as the friend of Lamb, Coleridge, Wordsworth and Southey.

Robinson was a great conversationalist, and his breakfast parties rivalled those of Samuel Rogers. He died in London on Feb. 5, 1867.

His *Diary* of 35 vol., his *Journals* of 30 vol. and his *Letters and Reminiscences* in 36 vol. contain vivid pictures, drawn by an acute and sympathetic observer who had exceptional opportunities of seeing contemporary celebrities. They are preserved at Dr. Williams' library in Gordon Square, London. Crabb Robinson seems to have intended to edit these for publication, but except for a selection edited by Thomas Sadler and entitled *The Diary, Reminiscences, and Correspondence of H. Crabb Robinson*, 3 vol. (1869) and the *Correspondence of Henry Crabb Robinson with the Wordsworth Circle*, ed. by E. J. Morley, 2 vol. (1927) they have never been reprinted. Robinson was one of the founders of the Athenaeum club and of University College, London.

ROBINSON, JOHN (1575-1625), English nonconformist divine. Robinson settled in Amsterdam in 1608, but in the following year removed, with a large contingent, to Leyden, where he ministered to a community whose numbers gradually grew from 100 to 300. In 1620 a considerable minority of these sailed for England in the "Mayflower," and ultimately crossed the Atlantic in the "Mayflower"; it was Robinson's intention to follow as soon as practicable, with the rest of his flock, but he died before the plan could be carried out, on March 1, 1625.

Among his publications may be mentioned *Justification of Separation from the Church* (1610), *Apologia Brownistarum* (1619), *A Defence of the Doctrine Propounded by the Synod of Dordt* (1624) and a volume of *Essays, or Observations Divine and Moral*, printed in 1625. His *Works* (with one exception, *A Memorial to a Manducation*, since published by the Massachusetts Historical Society, series iv, vol. 1), including a memoir, were reprinted by R. Ashton in 3 vol. in 1851. A summary of their contents is given in G. P.unchard, *History of Congregationalism*, iii, 300-344 (1876). See further CONGREGATIONALISM, and the literature there cited; also O. S. Davis, *John Robinson* (1897).

ROBINSON, JOSEPH TAYLOR (1872-1937), U.S. politician, was born at Lonoke, Ark., on Aug. 26, 1872. After graduating from the University of Arkansas and receiving his law degree at the University of Virginia, he returned to Lonoke in 1895 to practise. He became interested in politics at once, was elected a member of the state legislature, 1895-97, and served as delegate to the Democratic national convention in 1900. In 1902 he was elected U.S. representative, in which office he was continued until he was elected governor of Arkansas in 1912. He was governor but a few weeks when he was elected by the state legislature to fill

the position of U.S. senator left vacant by the death of Sen. Jefferson Davis.

Robinson was re-elected senator in 1918 and in 1924. In 1923 he was chosen to succeed Sen. O. W. Underwood as chairman of the minority conference and Democratic floor leader. He possessed an unusual knowledge of parliamentary procedure, was a ready debater and was influential in securing much-needed legislation.

Robinson served as permanent chairman of the Democratic convention of 1928, and received the nomination of his party for the office of vice-president.

ROBINSON, LENNOX (1886-), Irish dramatist and author, was born at Douglas, County Cork, on Oct. 4, 1886, and educated at Bandon Grammar school. His first play, *The Clancy Name*, was produced in 1908 at the Abbey theatre, Dublin, of which he was manager from 1910 to 1914. In 1915 he was appointed organizing librarian to the Carnegie trust, a post which he held until 1925. From 1919 to 1923 he was again manager of the Abbey theatre, and in 1923 became director.

Robinson's plays *The Lost Leader* (1918) and *The White-headed Boy* (1916) were both produced in London and in the United States. In addition to numerous plays, he wrote a novel, *A Young Man from the South* (1917), and several volumes of short stories.

His plays include *The Cross Roads* (1909); *Two Plays* (1910); *Patriots* (1912); *The Dreamers* (1915); *The Round Table* (1924); *Crabbed Youth and Age* (1924); *Birds' Nest* (1938); *Pictures in a Theatre* (1947); and *The Lucky Finger* (1949).

ROBOT. This term has long been in use in many languages. It is derived from the Czech word *robota* (work). It passed into popular use after 1923 to describe either mechanical devices so constructed as to be subject to human control, or mechanical devices which, like the human mind, are capable of independent action. The word was first used in English by Karel Čapek in his play *R.U.R.* (Rossum's Universal Robots), written in 1920. The word was also used in the Czech language in 1911, as in the title of a play by Karel Čapek, *Roboti*, which was the first time the word was used in any language. The word was also used in the Czech language in 1911, as in the title of a play by Karel Čapek, *Roboti*, which was the first time the word was used in any language. The word was also used in the Czech language in 1911, as in the title of a play by Karel Čapek, *Roboti*, which was the first time the word was used in any language.

The word was also used in the Czech language in 1911, as in the title of a play by Karel Čapek, *Roboti*, which was the first time the word was used in any language.

In the *Arabian Nights'* tale of the "Forty Thieves," Ali Baba stood before the cave and said "Open Sesame." The portal swung open without the aid of human hands. A robot controlling the door of an industrial plant in the U.S. actually opens when addressed in precisely the same words; addressed in any other manner the door remains immovable. In a mediæval romance a great brazen head in the castle of a giant would tell those who inquired whatever they wished to know about the past, present or future.

In Washington, D.C., is a robot, known as the "Great Brass Brain" and to it are put questions about future ocean tides, which are promptly answered. It predicts the tides (7.7.) for every port in the world for years ahead with great precision. (See MATHEMATICAL INSTRUMENTS: *Harmonic Analyzers*.)

Mythical manlike monsters permeate the folklore of all peoples. Albertus Magnus in the middle ages, Roger Bacon, Descartes, and other philosophers built androids or automatons in human form, which could open doors and play musical instruments. Anthropoid figures, which apparently perform actions which civil for independent thought are still to be seen and are often accepted with credulity by the public. On the other hand modern mechanical men have been constructed and placed at the disposal

of industry, that have sensitive fingers and ears, talk with a predetermined conversation, that are able to test by "a sense of taste" chemicals, and with some equivalent of the sense of smell and balance. By the use of photo-electric cells, the partial equivalent of the sense of sight has been accomplished. (See the articles **SELENIUM CELLS**, **PHOTOELECTRICITY**, **AUTOMATIC MACHINES**.)

Perhaps the most valuable outcome of these endeavours will be the development of mechanisms capable of taking over those tasks that men and women find too monotonous or otherwise burdensome. One such device is the **Televox**, invented in 1927 by R. J. Wensley of the Westinghouse Electric and Manufacturing Co. This device permits the use of the network of the telephone system for the distant control of an electrical mechanism by means of certain sounds. The mechanism is arranged to answer the telephone and execute orders in a manner peculiarly similar to that of a human being. It was developed for the use of public utility companies to supplement the use of supervisory control systems of electrical sub-stations, reservoir systems, gas regulators, etc.

The **Televox** can transmit electric meter readings, heights of water, gas pressures, position of valves and switches, and can execute actual mechanical operations at the direction of a distant operator. In using the **Televox** a call is put through exactly as though there were a human operator on the other end of the phone. The person making the call uses certain tones of the desired pitch to transmit the message. It is essential that a consistency of pitch be maintained. These tones are ordinarily delivered by electrically driven tuning forks. The telephone transmitter converts the tones into electrical vibrations, which at the distant station are caused to actuate steel reeds, which in turn actuate the selecting and operating relays. The responses are obtained from an instrument placed near the transmitter which sounds certain combinations of long and short notes, to form a code understandable by the operator at the other phone. The machine "hangs up" the receiver when the order has been executed, thereby ending the "conversation."

There are a number of processing machines which control all processes in a given industry, including temperature and humidity control during the process, starting, stopping, and varying the different materials which enter into the process in accordance with a time schedule, and independent of an outlet. If anything goes wrong, the machine stops and shows a red light until the operator has made the necessary changes. At the conclusion of the operation the machine shows a green light until the operator has removed the material in process. The **Tagliabue Automatic Flue-Gas Analyzing Machine** which makes an analysis for CO₂ and for CO every minute, and records the results, is such a robot.

The **Product Integrator** is a robot which solves almost any second-order differential equation. It performs, by a combination of electrical and mechanical means, certain computations which are actually beyond the power of the human brain, so far demonstrated. Other processes, which if performed by mathematics would require from a week to a year to solve, are solved by the integrator in a few minutes or hours.

(For New York City traffic control system see **TRAFFIC AND TRAFFIC REGULATION**.)

ROB ROY (1671-1734), the designation of a Highland outlaw whose prowess is the theme of one of Sir Walter Scott's novels, and who was by descent a Macgregor. He received the name Roy from his red hair, and latterly adopted Campbell as his surname on account of the acts proscribing the name of his own clan. At first he devoted himself to rearing cattle on his estates on the Brnes of Balquhider, but having formed a band of clansmen, he obtained, after the accession of William III, a commission from James II to levy war on all who refused to acknowledge him as king. Shortly afterwards he married Helen Mary, daughter of Macgregor of Comar. On the death of Gregor Macgregor, the chief of the clan, in 1693 he was acknowledged chief, obtaining control of the lands stretching from the Brnes of Balquhider to the shores of Loch Lomond, and situated between the possessions of Argyll and those of Montrose. To assist in carrying on his trade as cattle-dealer he borrowed money from the

1st duke of Montrose, and, being unable to repay it, was in 1712 evicted and declared an outlaw. Taking refuge in the Highlands, Rob Roy supported himself by depredations on the duke and his tenants, all attempts to capture him being unsuccessful. During the rebellion of 1715, though nominally siding with the Pretender, he took no part in the battle of Sheriffmuir except in plundering the dead on both sides. He was included in the Act of Attainder; but through the influence of the duke of Argyll, he obtained, on making his submission at Inveraray, a promise of protection. He established his residence at Craigroyden, near Loch Lomond, whence he levied blackmail as formerly upon Montrose. Through the mediation of Argyll, he was reconciled to Montrose, and in 1722 he made submission to General Wade; he was carried off, and imprisoned in Newgate, and in 1727 was pardoned just as he was to be transported to Barbados. He died at Balquhider on Dec. 28, 1734, and was buried in Balquhider churchyard.

The best lives are K. Macdony, *Historical Memoirs of Rob Roy* (1818; new ed., 1881); A. H. Millar, *Story of Rob Roy* (1883). See also Sir W. Scott's introduction to the novel *Rob Roy*. An early account, *The Highland Rogue*, etc. (1723), is ascribed to Defoe.

ROBSART, AMY, first name of **LADY AMY DUDLEY** (1532-1560), wife of Lord Robert Dudley, afterwards earl of Leicester. She was the daughter of Sir John Robsart of Norfolk, and was married to Lord Robert on June 4, 1550. When Elizabeth became queen in 1559 Lord Robert was soon known to be her favourite, and it was believed that she would marry him if he were free. His wife never came to court and was never in his company. In 1560 she went by her husband's directions to Cumnor Place, a house near Oxford, rented by his agent Anthony Forster or Forrester, member of parliament for Abingdon. Here she was found lying dead on the floor of the hall on Sept. 8, 1560, by her servants. The circumstances of her death were never cleared up.

See G. Adlard, *Amy Robsart and Leicester* (London, 1870), and W. Rye, *The Murder of Amy Robsart* (London, 1885); Sir B. H. T. Freer, *Amy Robsart of Wymondham; the Story of her Life and the Mystery of her Death* (Norwich, 1937).

ROC, or more correctly **RUKH**, a fabulous bird of enormous size which carries off elephants to feed its young. The legend of the roc, familiar from the *Arabian Nights*, was widely spread in the east; and later the home of the monster was sought in Madagascar, when gigantic fronds of the *Raphia* palm very like a quill in form appear to have been brought under the name of roc's feathers (see *Yule's Marco Polo*, bk. iii, ch. 33). Such a feather was brought to the Great Khan, and we read also of a gigantic stump of a roc's quill being brought to Spain by a merchant from the China seas.

The roc is hardly different from the Arabian *'anākā* (see **PHOENIX**); it is also identified with the Persian *simurgh*.

BIBLIOGRAPHY.—For a collection of legends about the roc, see E. W. Lane, *Arabian Nights* (1839), chap. xx, notes 22, 62; H. Yule, *The Book of Ser Marco Polo* (1871). See also S. Bochart, *Hierozoicon* (1663), bk. vi, ch. 14; Al Kazwini, *Kosmographie* (1847-48), i, 419 et seq.; Ibn Batūta, *Voyages* (1853), iv, 305 et seq.; Ad Damiri, *Hayat al-Hayawan*, trans. A. S. G. Jayakar (1906).

ROCAILLE, in architecture, a form of ornament much used in the rococo style, based originally on the grotesque, artificial rockeries and shells of the Louis XV period. (See **LOUIS STYLES**; **Rococo**.)

ROCAMADOUR, a village of southwestern France, in the department of Lot, 36 mi. N.N.E. of Cahors by road. Pop. (1946) 185. Rocamadour owes its origin to St. Amador or Amateur, who, according to tradition, chose the place as a hermitage for his devotions to the Virgin Mary. The renown of Rocamadour as a place of pilgrimage dates from the early middle ages. Rocamadour is most strikingly situated. Its buildings rise in stages up the side of a cliff on the right slope of the gorge of the Alzou. Flights of steps ascend from the lower town to the churches halfway up the cliff. The chief of them is the church of Notre-Dame (1479), containing the wooden figure of the Madonna reputed to have been carved by St. Amador. The interior walls of the church of St. Sauveur are covered with paintings and inscriptions recalling the pilgrimages of celebrated persons. The subterranean church of St. Amador (1166) extends beneath St. Sauveur and contains relics of the saint. On the summit of the

ROBOTS AND THEIR FUNCTIONS IN VARIOUS INDUSTRIES

1. Cut-away drawing of "Sparkie," a robot dog that walks, sits down or barks at his master's command; companion to "Elektro," mechanical man at the New York World's Fair, 1940. 2. Automatic direction finder for aeroplanes. When tuned to a radio station, it points continuously and automatically to that station without requiring the pilot's attention. 3. A single robot used in pyrometry. 4. An automatic cyclo controller,

used in industry for the regulation of the various steps in a manufacturing process, in this case for controlling all the operations in the curing of rubber. 5. American Coast and Geodetic Survey tide-predicting machine. 6. "Erie," a novel mechanical adaptation of the robot, which moves and talks by means of concealed apparatus. 7. The Sperry ship stabilizer by means of which freedom from undue rolling is obtained.

cliff stands the mediaeval château built to defend the sanctuaries.

ROCAMBOLE, *Allium scrotoprasum* (family Liliaceae), a hardy bulbous perennial occurring in a wild state in sandy pastures and waste places throughout Europe and Asia Minor, and often called giant garlic, but not common in the south; in Great Britain it is rare, and found only in the north of England and the south of Scotland. The plant is grown for its bulbs, which are smaller and milder than those of garlic, and consist of several cloves chiefly produced at the roots. The cloves are planted about the end of February or in March, and treated like shallot. It is practically unknown in the U.S.

ROCH, ST. (Lat. Rochus; Ital. Rocco; Span. Roque; Fr. Roch) (d. 1377), a confessor whose death is commemorated on Aug. 16; he is specially invoked against the plague. According to his *Acta*, he was born at Montpellier, France, about 1295. On the death of his parents in his twentieth year he gave all his substance to the poor. During an epidemic of plague in Italy, he tended the sick at Aquapendente, Cesena and Rome, and effected miraculous cures by prayer and simple contact. After similar ministries at Piacenza he himself fell ill. He was expelled from the town, and withdrew into the forest, where he would have perished had not a dog belonging to a nobleman named Gothardus supplied him with bread. On his return to Montpellier he was arrested as a spy and thrown into prison, where he died Aug. 16, 1377, having previously obtained from God this favour—that all plague-stricken persons invoking him be healed. His cult spread through Spain, France, Germany, Belgium and Italy. A magnificent temple was raised to him at Venice.

See *Acta sanctorum*, August iii. 380-415; Charles Cahier *Les Caractéristiques des saints* (Paris, 1867), pp. 216-217. (H. DE.)

ROCHAMBEAU, JEAN BAPTISTE DONATIEU DE VIMEUR, COMTE DE (1725-1807), French soldier, was born at Vendôme (Loir-et-Cher) on July 1, 1725. He was brought up at the Jesuit college at Blois, but entered a cavalry regiment. He served in Bohemia and Bavaria and on the Rhine, and in 1747 had attained the rank of colonel. He became governor of Vendôme in 1749, and after distinguishing himself in 1756 in the Minorca expedition was promoted brigadier of infantry. In 1757 and 1758 he fought in Germany, notably at Crefeld, received several wounds in the battle of Clostercamp (1760), and was appointed *maréchal de camp* in 1761 and inspector of cavalry. In 1780 he was sent, with the rank of lieutenant-general, in command of 6,000 French troops to help the American colonists under Washington against the English. He landed at Newport, Rhode Island, on July 10, but was held here inactive for a year, owing to his reluctance to abandon the French fleet, blockaded by the British in Narragansett Bay. At last, in July 1781, Rochambeau's force was able to leave Rhode Island and joined Washington on the Hudson. Then followed the celebrated march of the combined forces to Yorktown, where on Sept. 22, they joined the troops of Lafayette; Cornwallis was forced to surrender on Oct. 19. Congress voted Rochambeau and his troops the thanks of the nation and presented him with two cannon taken from the English. These guns, which Rochambeau took back to Vendôme, were requisitioned in 1792. On his return to France he was loaded with favours by Louis XVI. and was made governor of Picardy. During the Revolution he commanded the Army of the North in 1790, but resigned in 1792. He was arrested during the Terror, and narrowly escaped the guillotine. He was subsequently pensioned by Bonaparte, and died at Thoré (Loir-et-Cher) on May 10, 1807.

A statue of Rochambeau by Ferdinand Hamar, the gift of France to the United States, was unveiled in Lafayette square, Washington, by President Roosevelt on May 26, 1902.

The *Mémoires militaires, historiques et politiques, de Rochambeau* were published by Luce de Lancival in 1809. Of the first volume a part, translated into English by M. W. E. Wright, was published in 1838 under the title of *Memoirs of the Marshal Count de R. relative to the War of Independence in the United States*. Rochambeau's correspondence during the American campaign is published in H. Doniol, *Hist. de la participation de la France à l'établissement des États Unis d'Amérique*, vol. v. (1892). See Duchesne, "Auteur de Rochambeau" in *la Revue des sociétés catholiques de Forest* (1808-1900): E.

Gachot, "Rochambeau" in the *Nouvelle Revue* (1902); H. de Ganniers, "La Dernière Campagne du maréchal de Rochambeau" in the *Revue des questions historiques* (1907), and J. J. Jusserand, "Rochambeau and the French in America" in *With Americans of Past and Present Days* (1916).

ROCHDALE, municipal, county and parliamentary borough, Lancashire, England, on the river Roch and the Rochdale canal, 10½ mi. N.E. of Manchester and 196 mi. N.W. of London by L.M.S.R. Pop. (est. 1938) 91,290. Area, 14.9 sq.mi. The site rises sharply from the Roch, near its confluence with the Spodden, and there are fine views from the high-lying public park. Several interesting old houses remain nearby. The parish church of St Chad, mainly Perpendicular, has Early English nave piers and a tower the lower part of which is Decorated. Of educational charities the principal is the Archbishop Parker free grammar school (founded 1565). There are also technical and art schools; and a large Roman Catholic orphanage. Rochdale was the birthplace of the co-operative movement. The Equitable Pioneers society was founded here in 1844. A statue of John Bright (1891) recalls the connection of the statesman's family with Rochdale. Rochdale was incorporated in 1856, but the parliamentary borough has returned one member since 1832. The county borough was created in 1888.

Rochdale (Recedham, Rachedam, Rachedal) takes its name from the river on which it stands. A Roman road passed the site, and a Saxon castle stood in Castleton. In Edward the Confessor's reign most of the land was held by Gamel the Thane, but after the Conquest the manor came into the hands of Roger de Poitou, from whom it passed to the Lacys and became merged in the duchy of Lancaster. From 1462 to 1625 the crown leased it to the Byron family. In 1625 Charles I. conveyed the manor in trust, and in 1638 it was sold to Sir John Byron, afterwards Baron Byron of Rochdale, whose descendants held it till 1833 when it was sold to the Deardens. Henry III (1240-41) granted to Edmund de Lacy the right to hold a weekly market on Wednesday and an annual fair on the feast of SS. Simon and Jude (Oct. 28).

ROCHDALE PIONEERS: *see* CO-OPERATION.

ROCHEFORT, HENRI, MARQUIS DE ROCHEFORT-LUYAÇ (1830-1913), French politician, was born in Paris on Jan. 30, 1830. He was already known as a successful journalist and writer of vignettes when he started a paper of his own, *La Lanterne*. The paper was so successful that he was elected to the Académie des Sciences Religieuses in 1862. He was elected to the Chamber of Deputies in 1869, and was elected to the Chamber of Peers in 1875. He was elected to the Chamber of Deputies in 1881, and was elected to the Chamber of Peers in 1885. He was elected to the Chamber of Deputies in 1889, and was elected to the Chamber of Peers in 1893. He was elected to the Chamber of Deputies in 1897, and was elected to the Chamber of Peers in 1901. He was elected to the Chamber of Deputies in 1905, and was elected to the Chamber of Peers in 1909. He was elected to the Chamber of Deputies in 1913, and was elected to the Chamber of Peers in 1917. He was elected to the Chamber of Deputies in 1921, and was elected to the Chamber of Peers in 1925. He was elected to the Chamber of Deputies in 1929, and was elected to the Chamber of Peers in 1933. He was elected to the Chamber of Deputies in 1937, and was elected to the Chamber of Peers in 1941. He was elected to the Chamber of Deputies in 1945, and was elected to the Chamber of Peers in 1949. He was elected to the Chamber of Deputies in 1953, and was elected to the Chamber of Peers in 1957. He was elected to the Chamber of Deputies in 1961, and was elected to the Chamber of Peers in 1965. He was elected to the Chamber of Deputies in 1969, and was elected to the Chamber of Peers in 1973. He was elected to the Chamber of Deputies in 1977, and was elected to the Chamber of Peers in 1981. He was elected to the Chamber of Deputies in 1985, and was elected to the Chamber of Peers in 1989. He was elected to the Chamber of Deputies in 1993, and was elected to the Chamber of Peers in 1997. He was elected to the Chamber of Deputies in 2001, and was elected to the Chamber of Peers in 2005. He was elected to the Chamber of Deputies in 2009, and was elected to the Chamber of Peers in 2013. He was elected to the Chamber of Deputies in 2017, and was elected to the Chamber of Peers in 2021.

Condemned under military law to imprisonment for life, he was transported to New Caledonia. In 1874 he escaped to San Francisco. He lived in London and Geneva until the general amnesty permitted his return to France in 1880. He then founded *L'Intransigent* in the Radical interest. He was condemned to detention in a fortress in August 1889 at the same time as General Boulanger, whom he had followed into exile. After his return

(1895) to Paris he became a leader of the anti-Dreyfusards. Subsequently he was editor of *La Patrie*. Rochefort died at Aix-les-Bains in 1913.

Besides his plays and articles in the journals he published several separate works, among them being: *Les Petits Mystères de l'Hôtel des Ventes* (1862), a collection of his art criticisms; *Les Dépravés* (Geneva, 1882); *Les Naufrageurs* (1896); *L'Évadé* (1883); *Napoléon dernier* (3 vols., 1884); and *Les Aventures de ma vie* (5 vols., 1896).

ROCHEFORT, a small town of Belgium, on the Lomme, a tributary of the Lesse, in the south-east of the province of Namur close to the Ardennes. Resident pop. (1939) 3,492, doubles in July and August. It has ruins of the old castle, which gave the place its name and a title to a long line of counts who had the right of coining their own money. This castle underwent many sieges and suffered much in the earlier wars, especially at the hands of Marshal de Chatillon in 1636. Rochefort is noted for its healthfulness, and is a favourite place of residence and resort. There are many grottoes, one of which, in the town itself, contains six halls or chambers; the largest, called the Sabbat, is remarkable for its great height. But the most famous are the grottoes of Han, three miles from Rochefort where the river Lesse passes by a subterranean and undiscovered passage under the hill called Boème or Boine. The endeavour to trace the course of the river led to the discovery of the grottoes, which consist of fifteen separate halls, connected by passages more or less short and emerging on the river in a dark and extensive cavern forming a sort of side creek or bay. Near Rochefort are the famous red marble quarries of St. Remy, and the old Cistercian abbey of that name is now a Trappist monastery.

ROCHEFORT, a town of western France, capital of an arrondissement in the department of Charente-Inférieure, 20 m. S.E. of La Rochelle on the State railway from Nantes to Bordeaux. Pop. (1936) 28,222.

The lordship of Rocheort, held by powerful nobles in the 11th century, was united to the French crown by Philip the Fair early in the 14th century; but it was alternately seized during the Hundred Years' War by the English and the French and in the Wars of Religion by the Catholics and Protestants. Colbert in 1665 chose Rochefort as the seat of a repairing port between Brest and the Gironde, so the town rapidly increased in importance, and the Dutch admiral Cornelius Tromp with his fleet failed to destroy the new arsenal. The naval school, afterwards transferred to Brest, was originally founded at Rochefort. Its fleet, under Admiral La Galissonnière, a native of the place, defeated Admiral Byng in 1755 and did good service in the wars of the republic. But the destruction of the French fleet by the English in 1809 in the roadstead of Ile d'Aix and the preference accorded to Brest and Toulon and the unhealthfulness of its climate diminished its prosperity. It was from the Ile d'Aix that Napoleon embarked on the "Bellerophon" in 1815.

Rochefort is capital of the fourth maritime arrondissement. The commercial harbour, higher up the river than the naval harbour, has two small basins, a third basin with a depth at neap tide of 24 ft., at springtide of 30 ft. and a dry dock. Trade is in wood, cereals, salt and coal.

ROCHESTER, JOHN WILMOT, 2ND EARL OF (1647-1680), English poet and wit, the son of Henry Wilmot, the 1st Earl, was born at Ditchley in Oxfordshire on April 10, 1647, and succeeded his father as 2nd earl in 1658. He was educated at Wadham college, Oxford, and in 1661, although he was only 14 years of age, received the degree of M.A. On leaving Oxford he travelled in France and Italy with a tutor. He returned in 1664, and at once made his way to Charles II.'s court, where his youth, good looks and wit assured him of a welcome. In 1665 he joined the fleet serving against the Dutch as a volunteer. He became gentleman of the bedchamber to Charles II. John Dryden had dedicated to him his *Marriage à-la-Mode* (1672); but his *Aurengzebe* (1675) was dedicated to Lord Mulgrave, who was Rochester's enemy. Consequently Rochester thwarted Dryden at every turn, and in 1679 a band of roughs set on the poet in Rose Alley, Covent Garden, and beat him. Rochester obviously felt no shame for this infamous attack, for in his "Imitation of the First Satire of Juvenal" he says, "Who'd be a wit in Dryden's

culgedged skin?" His health was already undermined, and in the spring of 1680 he retired to High Lodge, Woodstock Park. He began to show signs of a more serious temper, and at his own request the sincerity of his repentance. He died, however, two days after the bishop left him. When his son Charles, the 3rd earl, died on Nov. 12, 1681, his titles became extinct.

As a poet Rochester was a follower of Abraham Cowley and of Boileau, to both of whom he was considerably indebted. His love lyrics are often happy, but his real vigour and ability is best shown in his critical poems and satires. The political satires are notable for their fierce exposure of Charles II.'s weakness.

ROCHESTER—Poems on Several Occasions by the Right Honourable the Earl of Rochester... (Antwerp, 1680) was really printed in London. Other issues, slightly varying in title and contents, appeared in 1685, 1691 and 1696. *Valentinian, A Tragedy*, adapted from Beaumont and Fletcher, was printed in 1685; a scurrilous attack on Charles II. in the shape of a play in heroic couplets, *Sodom*, was printed in 1684, and is supposed, in spite of Rochester's denial, to have been chiefly his work. No copy of this is known, but there are two mss. extant. The complete edition of his works is *The Poetical Works of the Earl of Rochester* (1731-32). Expurgated collections are to be found in Johnson's, Anderson's and Chalmers's editions of the *British Poets*. His *Familiar Letters* were printed in 1686, 1697 and 1699. His Political Satires are available, with those of Sir John Denham and Andrew Marvell, in the *Bibliotheca Curiosa*, Some Political Satires of the Seventeenth Century, vol. 1, Edinburgh, 1885.

ROCHESTER, LAWRENCE HYDE, EARL OF (1641-1711), English statesman, second son of Edward Hyde, earl of Clarendon, was born in March 1641. After the restoration of Charles II. he sat as member of parliament, first for Newport in Cornwall and afterwards for the university of Oxford, from 1660 to 1679. In 1661 he was sent on a complimentary embassy to Louis XIV. of France, while he held the court post of master of the robes from 1662 to 1675. In 1665 he married Henrietta (d. 1687), daughter of Richard Boyle, earl of Burlington and Cork. When his father was impeached in 1667, Lawrence joined with his elder brother, Henry, in defending him in parliament, but the fall of Clarendon did not injuriously affect the fortunes of his sons. They were connected with the royal family through the marriage of their sister, Anne, with the duke of York, afterwards James II., and were both able and zealous royalists. In 1687 Lawrence Hyde was made Viscount Hyde of Kenilworth, and in November following earl of Rochester. He was compelled to join in arranging the treaty of 1681, by which Louis XIV. agreed to pay a subsidy to Charles, at the very moment when he was imploring William, prince of Orange, to save Europe from the ambitions of the French monarch. In August 1684 he was removed from the treasury to the post of president of the council. He was still president of the council when James II. became king in February 1685, and he was at once appointed lord treasurer. But in spite of their family relationship and their long friendship, James and his treasurer did not agree. In January 1687 he was removed from his office of treasurer.

After the revolution of 1688 Rochester, after a brief protest, accepted the new régime. From December 1700 until February 1703 he was lord lieutenant of Ireland, and in 1710 he was again made lord president of the council. He died on May 2, 1711, and was succeeded by his only son, Henry (1672-1758), who in 1724 inherited the earldom of Clarendon. When Henry died without issue on December 10, 1758, all his titles became extinct.

The correspondence of Rochester with his brother the earl of Clarendon, together with other letters written by him, was published with notes by S. W. Singer (1828). Other authorities are G. Burnet, *History of his Own Time*, edited by O. Ayr (Oxford, 1897-1900); John Evelyn, *Diary*, edited by H. B. Wheatley (1879); and Macaulay, *History of England*.

ROCHESTER, a city and municipal and parliamentary borough of Kent, England, on the river Medway, 33 mi. E.S.E. of London by the S.R. Pop. (1938) 37,730. Area, 6.4 sq. mi. Its situation on the Roman way from the Kentish ports to London, as well as at a Medway crossing, gave Rochester (Durobrivae, Hrofescester or Hrobfester, Roffa) an early importance. It was a walled Romano-British town, and the original bridge across the Medway probably dated from that period. The church of St.

Andrew was founded by King Aethelbert, who also made Rochester a bishop's see. Rochester was a royal borough in the time of William I, who raised a castle there, probably on Boley hill. Richard I granted the citizens quittance of *passagium* from crusaders in the town of Rochester. In 1227 Henry III granted them the city at a fee farm rent of £25; he also granted them a guild merchant, the right to be impleaded only within the city walls and other liberties. These charters were confirmed by subsequent sovereigns down to Henry VI, who in 1446 incorporated the city, and granted it the power of admiralty and many privileges. Charters were granted in later reigns down to Charles I, whose charter of 1629 reinstated the governing charter until 1835. Rochester returned two members to parliament from Edward I's time until 1885, one from then until 1918, and two from then on.

The cathedral church of St. Andrew was originally founded by Augustine in 604, for whom Aethelbert built the church. It was partially destroyed by the Danes, but was rebuilt by Bishop Gundulph, the second Norman bishop (1077-1108). Gundulph at the same time (1089) established an order of Benedictine monks there. Bishop Ernulf (1115-24) completed and also renovated the church, lengthening it by two bays eastward; the old chapter house remains. The Norman west front was built about 1125-30, and in 1130 the new cathedral was consecrated. The work included an extended choir by William de Hoo (1227), enlargement of the main transepts, the building of piers for a central tower and treatment of the nave to the third bay. About 1352 a low central tower was built, to which a spire was added in the next century. Toward the end of the 15th century St. Mary's chapel was added.

The ruins of Gundulph's tower stand detached from and are earlier than the church; it was built by Bishop Gundulph probably as a defensive work for the eastern boundary of the city. The crypt beneath the choir is Early Norman in the western part. The remainder is Early English, and there are traces of mural painting. The library attached to the modern chapter house contains, among various relics, the *Tentus Rossensis*, being records of the cathedral compiled in the time of Bishop Ernulf.

On the eminence overlooking the right bank of the river and commanding a wide view of the surrounding country are the remains of the Norman castle, part of which was built by Bishop Gundulph at the order of William Rufus in the 11th century. The castle was besieged by King John, by Simon de Montfort in the reign of Henry III and by the followers of Wat Tyler. It was repaired by Edward IV, but soon afterward fell into decay, although the massive keep still stands. This is the work of William de Corbeil, archbishop of Canterbury, to whom the castle was granted in 1126. It is a quadrangular four-storied structure, flanked by turrets, with a height of 120 ft. Remains of the 13th-century walls which once surrounded the city also exist. Charles Dickens lived at Gad's hill, above Strood, to the northwest. At Borstal, southwest of Rochester, was a large convict prison where early experiments on the educational treatment of delinquent boys between the ages of 16 and 21 were carried out, which resulted in the Borstal system (q.v.).

Among the principal buildings in the city are the town hall (1687), the Richard Watt's almshouses (1579) and the almshouse of St. Catherine, which originated in 1316 as a lepers' hospital. An Elizabethan mansion was acquired by the corporation for a museum as a memorial of Queen Victoria's diamond jubilee. The principal schools are the cathedral grammar school or King's school, founded in 1544, and the Williamson mathematical school (1704), formerly for sons of freemen but now open to all. St. Bartholomew's hospital (1078) occupies modern buildings, though the ancient chapel remains. A municipal airport has been provided by the corporation.

ROCHESTER, a city of southeastern Minnesota, U.S., on the Zumbro river, at an altitude of 1,180 ft.; the county seat of Olmsted county and the home of the world-famous Mayo clinic. It is on federal highways 14, 52 and 63, and is served by the Chicago Great Western and the Chicago and North Western railways and by motorbus lines in all directions. Mid-Continent, Northwest, Western and Mid-West air lines provide the city with air transportation. Pop. (1950) 29,634; (1940) 26,312 by the

federal census. The transient population was estimated in 1950 at 300,000 annually. There are wholesale groceries and commission houses, large creameries, a canning factory, a phonograph factory and several other manufacturing industries. The Mayo Civic auditorium is municipally owned. The city also owns and operates a hydroelectric plant, as well as its electric plant and water system. Just east of the city is the Rochester state hospital for the mentally ill, in a tract of 1,424 ac., with accommodations for 1,400 patients. On Aug. 21, 1883, a severe tornado devastated the northern part of the city, killing 26 persons and injuring 41. A direct consequence of this disaster was the founding of St. Mary's hospital by the Sisters of Saint Francis, who had opened a convent there in 1877. The hospital was opened to patients in 1880, with W. W. Mayo as consulting surgeon and his sons, William J. and Charles H. Mayo, as attending surgeons. There are two other hospitals and one hotel-hospital, together with St. Mary's, accommodating 2,000 patients. About 550 graduates of medical schools were studying at mid-20th century in the clinic and hospitals, under the Mayo Foundation for Medical Education and Research, incorporated in 1915 by the Mayos and endowed by them (through the University of Minnesota) with \$2,000,000.

The first settler in Rochester built his log cabin in 1854 and laid out the main street by dragging a log through the brush. He called it Rochester because the falls near by reminded him of those at Rochester, N.Y. By 1858 there was a population of 1,500, and the settlement was incorporated as a city.

ROCHESTER, a city of Strafford county, N.H., U.S., on the Cochecho and the Salmon Falls rivers, 22 mi. N.W. of Portsmouth. It is served by four lines of the Boston and Maine railroad. Pop. (1950) 13,776; (1940) 12,012; (1920) 9,673 (85% native white) by the federal census. The town of Rochester (named for Lawrence Hyde, earl of Rochester) was incorporated by royal charter in 1722, but no settlement was made until 1728. It was chartered as a city in 1891.

ROCHESTER, a city of northwestern New York, U.S., located on the Genesee river, the State Barge canal and Lake Ontario; a port of entry and the county seat of Monroe county. It has a municipal airport and is served by the Baltimore and Ohio, the Erie, the Lehigh Valley, the New York Central, the Pennsylvania and the West Shore railways, interurban buses, motorbuses and truck lines, lake steamers and canal barges. Pop. (1950) 331,252; (1940) 324,975; (1930) 328,132 by federal census.

The city occupies 34 sq.mi. on a broad plateau, ranging from 500 to 697 ft. above sea level. Through the centre runs the Genesee river, in a deep gorge with banks 50 to 200 ft. high, and within the city limits are three of its many cataclysms, with a combined fall of 267 ft. At the mouth of the river is the port of Rochester.

In the abandoned bed of the Erie canal a subway was constructed to accommodate local passenger and freight service and for a belt line connecting all the railways, with a boulevard (Broad street) for vehicular traffic at the street level above. The city's 1,300 streets have a total mileage of 526 (476 mi. paved). Its park system, planned by Frederick Law Olmsted, embraces 6 large and 20 small parks and provides generous facilities for outdoor play and recreation in 49 city playgrounds. Durand-Eastman park (484 ac.) has 4 mi. of frontage on Lake Ontario, and Genesee Valley park (600 ac.) contains some of the most picturesque stretches of the river. A city-planning bureau has been in existence since 1917, and zoning ordinances are in effect.

Rochester is an important educational centre, seat of the University of Rochester; Colgate-Rochester Divinity school (Baptist; 1850); St. Bernard's seminary (Roman Catholic; 1893); the Rochester School of Optometry; and the Rochester Institute of Technology (1829). The University of Rochester (founded 1850) consists of a college of arts and sciences, the Eastman school of music (established in 1918 by various gifts from George Eastman) and the school of medicine and dentistry (established in 1920 through gifts from George Eastman, the General Educa-

tion board and others). The public-school system adopted by the people of the city (comprising 30 grammar, 9 junior-senior high schools and 1 trade school) led in developing the junior high school, in using the school buildings as community centres and in various other improvements. There are 38 parochial schools and more than 20 other schools under private auspices. The charitable organizations of the city are jointly financed through a community chest, which had its origin during World War I. The daily papers include the *Times-Union* (Independent; 1826), the *Democrat and Chronicle*, the German *Abendpost* (1851) and the *Daily Record*, a legal paper. Italian, German, Catholic, Polish and Jewish weeklies are published. On Jan. 1, 1928, the city adopted a commission-manager form of government. The assessed valuation for 1949 was \$565,607,849. The falls of the Genesee provide water power, which has been utilized for manufacturing throughout the city's history. There were 970 manufacturing establishments in the Rochester metropolitan district in 1947, employing 104,997 people to whom was paid \$307,827,000. The factory output was valued at \$570,225,000. Rochester leads the world in the manufacture of photographic film, cameras, mail chutes, optical goods, check protectors, thermometers, dental equipment, office equipment and systems, enamelled steel tanks and horticultural products. The city is represented in 15 of the 16 major classifications into which the bureau of the census subdivides U.S. industries. There are several nurseries in the city and around it, shipping seeds, bulbs and plants to all parts of the country. The city has an extensive wholesale and retail trade.

When first visited by Europeans the region about Rochester was the home of the Seneca Indians. The Jesuit missionaries Pierre Chaumonot and Frémin worked among them in the 17th century. In 1687 the marquis de Denonville fought a battle with the Iroquois near the falls, and there was a French post on Irondequoit bay in 1710. The district was included in the Phelps-Gorham purchase in 1788. In 1789 Ebenezer ("Indian") Allan built a sawmill and a gristmill at the falls; in 1802 the site of the present city passed into the hands of three men from Maryland, among them Nathaniel Rochester (1752-1831), who established a settlement, largely of New Englanders, at the falls in 1810-12; and in 1817 the village of Rochester was incorporated. During the early years it grew slowly, since it was not on the direct route from Albany to Buffalo and the region was malarial. There were only 1,502 inhabitants in 1820. Monroe county was established in 1821, with Rochester as its judicial seat; the Rochester and Lockport section of the Erie canal was opened in 1823; in the next two years the population doubled, and in 1834, with a population of 12,252, the village was chartered as a city. Rochester was the centre (1828-30) of the anti-Masonic political movement, and there Thurlow Weed published his *Anti-Masonic Enquirer*. Later it became an active abolitionist centre, and for many years before the Civil War was a busy station on the "underground railroad." Myron Holley began the publication of the *Freeman* there in 1839, and in 1847 Frederick Douglass established the *North Star*. It was the home of Susan B. Anthony after 1846, and a gathering place for the advocates of women's rights. About 1850 it was the scene of the spiritualistic demonstrations (the "Rochester Rappings") of Margaret and Katharine Fox. Rochester has had a series of sobriquets. For many years, while the Genesee valley was the principal wheat field of the country, it was the leading flour-milling centre of the United States, and was known as the "Flour City." When the milling industry declined and the horticultural interests (introduced in 1840) assumed greater importance, "Flower" was substituted for "Flour"; later, with the development of the Eastman Kodak company, it was called also the "Kodak City." The population of the city was 36,403 in 1850; 80,366 in 1880; 162,608 in 1900.

ROCHESTER, a borough of Beaver county, Pa., U.S., on the Ohio river at its northernmost point and at the mouth of the Beaver, 25 mi. N.W. of Pittsburgh; served by the Pennsylvania railroad. Pop. (1950) 7,169. Rochester is a busy unit in the Beaver valley industrial district. (See **BEAVER FALLS**.) The borough was settled about 1799 and incorporated in 1849.

ROCHET, an ecclesiastical vestment which in the Roman

Catholic Church is a tunic of white, usually of fine linen or muslin, reaching about to the knee. It is distinguished from the surplice by its narrow and tight-fitting sleeves. The lower edge and the sleeves are usually garnished with lace, lined with violet or red silk in the case of prelates, or—more rarely—with embroidered borders. The rochet is proper to, and distinctive of, prelates and bishops, but the right to wear it is sometimes granted by the pope to others. In the Church of England, the rochet is a vestment peculiar to bishops, and is worn by them with the chalice (*q.v.*) both in church and on ceremonial occasions; *e.g.*, in the house of lords or at a royal levee. It is of plain, very fine linen (lawn) and reaches almost to the feet.

ROCHFORD, a town in southeastern Essex, Eng., 39 mi. E. by N. from London by the Southend branch of the Eastern Region railway. Pop. (1937) 3,905. It lies on the small river Roche near the head of a long estuary. The town has a Perpendicular church (St. Andrew), a corn exchange and some agricultural trade. Rochford hall, a gabled mansion of various dates, now a farmhouse, belonged once to the Boleyns; Anne Boleyn, the queen of Henry VIII, was born there. Near Rochford is Ashingdon, the scene of the flight of Assandun in 1016 between Canute and Edmund Ironside, in which the English were defeated.

ROCK, in geology a mass of the mineral matter of which the crust of the earth is composed (see **GEOLOGY**; **PETROLOGY**). In more general usage a "rock" is a large mass of this mineral matter, as distinguished from smaller pieces, "stones."

ROCKEFELLER, JOHN DAVIDSON (1839-1937), U.S. capitalist, born at Richford, N.Y., July 8, 1839. When he was 14 years old the family moved to Cleveland, O., where he attended the public school and then became an assistant bookkeeper (1855) in a commission house, earning \$50 the first three months. Soon he was advanced to \$25 per month and by 1858 he had saved enough to become a partner in a produce commission firm. In 1862 he and his partner had \$4,000 to invest together with Samuel Andrews, inventor of a more economical process for cleaning crude oil, in an infant business which was beginning to be spoken of as "oil refining." In 1867 the firm of Rockefeller and Andrews became Rockefeller, Andrews and Flagler, and by Jan. 1870 the partners did about one-fifth the refining business of Cleveland, then the chief oil-refining city in the U.S. In that month, together with his brother William, Stephen V. Harkness and other associates, he organized and became president of the Standard Oil company. The capitalization was \$7,000,000 in 10,000 shares, of which John D. Rockefeller held 2,667 and the firm of Rockefeller, Andrews and Flagler 1,000 shares. This corporation under Rockefeller's leadership was within ten years to establish itself as the most important factor in the petroleum industry in America.

When Rockefeller entered the oil industry it was in a highly chaotic state, subject to ruthless competition between local companies of small means, subject to disastrous fires, the uncertainties of drilling, wildcat financing and, finally, to a totally unsystematic control of production and distribution. To group all units of the industry under one leadership and to use their combined strength and control to bring about economies and improvements, to control supply and stabilize prices was Rockefeller's dream. His success was to have far-reaching results, for the Standard Oil company was the first great American combination to be conspicuously successful, and served by its example to further the trend toward consolidation and monopoly.

The spectacular advance of Standard Oil to supremacy was initiated with the aid of the South Improvement company, an association of leading refiners, formed in 1872. These associates prevailed upon the Pennsylvania, Erie and New York Central railways to grant 25-50% rebates on all oil shipped for members of the association and, in addition, to give "drawbacks" on all oil transported for competitors. With this effective mechanism for suppressing competition the other refiners in Cleveland were approached and urged to sell, being offered in payment their choice of either cash or Standard Oil stock. Of the 26 companies in the city 27 accepted the offer. Although public opinion forced the railways to repudiate their agreement within three months,

tion of race, sex or creed," a total of \$265,070,213, of which \$146,875,288 was from the principal. The board has co-operated with medical schools, colleges and universities with a view to developing teaching and research in the fundamental sciences, public education, industrial art, agricultural education and Negro education. In the few years that remain to the General Education board its resources are being concentrated largely in connection with three types of activity: first, the continuance of the existing program in the southern states; second, the support of research and experimentation in relation to the problems presented in the field of general education, *i.e.*, the secondary school through the junior college level, and third, a program in child growth and development. (R. B. F.)

The **Laura Spelman Rockefeller memorial** was founded in 1918 by John D. Rockefeller, in memory of his wife, Laura Spelman Rockefeller. The memorial was incorporated for the purpose of forwarding human welfare in all parts of the world. The principal of the fund (approximately \$73,000,000), as well as the income, was used by the trustees in their discretion. The memorial was merged in 1929 with the Rockefeller foundation. Aside from miscellaneous benefactions, appropriations of the memorial fell into two general categories, child welfare and the social sciences. In the field of child welfare the memorial has assisted in four general types of activity: scientific research, the preparation of teaching materials, the training of leaders for child study work and experiments and demonstrations in the practical organization of parent and teacher groups for the study of child life and child welfare. In support of social science the appropriations of the memorial fell into three groups: (1) appropriations to universities and research institutions; (2) appropriations for fellowships; (3) appropriations to central bodies such as the Social Science Research council, the National Research council and the American Council of Learned Societies.

The **Rockefeller Institute for Medical Research** in New York was founded in 1901 "to conduct, assist and encourage investigations in the sciences and arts of hygiene, medicine and surgery, and allied subjects, in the nature and causes of disease and the methods of its prevention and treatment, and to make knowledge relating to these various subjects available for the protection of the health of the public and the improved treatment of disease and injury." There are three departments of the Rockefeller institute: The Department of the Laboratories and the Department of the Hospital in New York city and the Department of Animal and Plant Pathology situated near Princeton, N.J. The present division of the institute into the above three departments corresponds with a natural division of medical research into three branches. The Department of the Laboratories deals with the problems of disease in their physiological, pathological, bacteriological, chemical and physical aspects and admits of the fullest use of the experimental method. The Department of the Hospital studies disease as it actually appears in human beings, facilities being provided not only for scientific observation and treatment of patients, but also—through experiments on animals—for solution of the problems arising from these clinical observations. The Department of Animal and Plant Pathology, through observation and experiment, deals with all aspects of the diseases of animals and plants.

The organization of the Rockefeller institute is divisible into a corporation which has general oversight and control of its activities, and a scientific staff which is directly charged with the responsibility of carrying on the scientific investigations. The corporation in turn is made up of trustees who are charged with the maintenance and care of the endowment and property of the institute, and a board of scientific directors which appoints the scientific staff and approves the general policy of investigation pursued. The board of scientific directors is an external body, composed of medical and other scientific men, meeting quarterly, and informed of the character and progress of the various researches under way or to be undertaken. The completed researches of the institute are published in scientific journals or issued as monographs and are periodically assembled into volumes of studies, which are issued to institutions of learning, libraries

and scientific workers throughout the world.

Spelman Fund of New York.—This fund was incorporated on Dec. 19, 1928, with a principal of \$10,000,000. The trustees have power to use principal as well as income to carry on its purposes. The charter states that the fund "is formed for exclusively charitable, scientific and educational purposes, including the advancement and diffusion of knowledge concerning child life, the improvement of interracial relations, and co-operation with public agencies." During its early years, the fund's program reflected these three interests, but with increasing emphasis on co-operation with public agencies. The gradual discontinuance of its participation in projects concerning child life and interracial relations left its program exclusively centred upon the improvement of methods and techniques in public administration. Support is extended to public and quasipublic agencies for dissemination of information on current administrative developments, for study and improvement of administrative practices and for testing new methods and devices under actual operating conditions.

John D. Rockefeller, Jr.—In his public gifts—more than \$60,000,000 up to 1929—John D. Rockefeller, Jr., has advanced his father's purpose to promote the well-being of mankind throughout the world. Notable among these gifts have been: To the Northern Baptist convention \$2,300,000; Bureau of Social Hygiene \$2,850,000; Brown university \$500,000; Inter-Church World movement \$1,500,000; International House, where hundreds of Columbia university students from many lands live harmoniously together, \$2,360,000; New York Public library \$3,500,000; Cathedral of St. John the Divine \$500,000; Young Men's Christian Association International committee \$1,500,000; Hampton Tuskegee institute (for Negroes) \$2,500,000; Metropolitan Museum of Art, \$2,000,000; toward restoration of gardens of Versailles and the Cathedral of Reims \$2,500,000; toward restoration of the Imperial university of Tokyo, Japan, 4,000,000 yen (\$1,540,000); International Education board \$21,000,000, to advance scientific research and education and to promote agricultural science and practice throughout the world; to the League of Nations library \$2,000,000; to erect and maintain an archaeological museum in Palestine \$2,000,000; to New York Botanical Gardens \$500,000; to colleges in the near east \$450,000; to New York Zoological society \$500,000; to aid the restoration and preservation of Williamsburg, Va., \$5,000,000.

ROCKETS. The extensive use of rockets in World War II by all the major nations involved again focused the attention of the public on this subject. The employment of rockets for military purposes has been revived from time to time. This last revival was brought about by extensive research and development by thousands of scientists engaged in this work for several years. Modern rockets are vastly different from the old military rockets. Their successful use in World War II makes it highly improbable that they will ever again be abandoned.

History of Rockets.—The rocket owes its existence to war pyrotechnics. Long before our era, the Chinese, Persians, Arabs and Greeks used rockets for giving signals and for communication between the separately encamped parts of the army as well as between these and the home territory. Even in combat actions the military pyrotechnists took their part at an early date, producing fire or incendiary balls and rockets and throwing them into the hostile ranks of the combatants, but mostly into the fortresses and besieged camps, posts and buildings, in order to set them on fire.

The origin of the rocket is lost in time, and the inventor of the rocket is as yet unknown. Only this much is certain—he must have lived long before the beginning of the Christian era. It has also been known from the earliest times that a powderlike mixture was used to drive arrows forward or accelerate their flight. The so-called fire bolt is referred to in the old literary sources of almost all peoples. To the Chinese belongs the credit of discovering saltpetre and its application in fireworks. They mixed this substance for the first time with sulphur and charcoal, and recognized the motive power arising from the combustion of this mixture, and made use of it in the preparation of their fire bolts (incendiary arrows). At first they made use of these salt-

petre mixtures for all sorts of pyrotechnical arts. Later they applied the mixture for making incendiary arrows, and in this manner created a dangerous implement of war.

The freely rising rocket as an instrument of war was apparently first developed by the Chinese about the year A.D. 1225. From China the rocket came by way of India, Arabia and Greece and gradually reached Byzantium, from which place the rest of the western world came into contact with the pyrotechnic arts. The rocket then arrived in Italy where it was adopted with special alacrity. The rocket also found its way to lower Germany, Flanders, France and England where it was frequently used in wars, from the second half of the 13th century. In Italy the rocket is mentioned for the first time in 1281 in Forlì (Emilia). Almost simultaneously the rocket made its appearance in the Low Countries. In the Ghent accounts of 1314 it is reported that the Flemish burghers had made use of it in the defense against pirates raiding their coastal cities. One of the first westerners to make a detailed report on rockets and to describe them fully was the mysterious Marcus Graecus, who about the middle of the 13th century made an extract from the works of Albertus Magnus and the English "powder-monk," Roger Bacon. This work appeared in the Greek language, but it is now available only in the Latin translation under the title *Liber ignium ad comburendum hostes*.

Rockets were used as early as 1258 at the old city of Cologne on the Rhine, at Metz in 1324 and in England in 1327 in the Scottish War. Their use in warfare continued for about one century. Gradually as guns came into use, rocket development became confined to types suitable for display purposes. Use for military purposes, however, continued in the orient. The British military probably came in contact with rockets in India and attempts again were made to develop them for war purposes. The early work was unsuccessful. But in 1804 Sir William Congreve resumed the experiments and by 1806 had developed a product so satisfactory that in October of that year he sought, and obtained, permission to assail the city of Boulogne with rockets fired from small boats of the British fleet. The results were encouraging, the missiles effecting considerable property damage and starting numerous fires. From then on, rockets had an established place as an auxiliary to, and sometimes in lieu of, field artillery and ships' guns of moderate calibre. They distinguished themselves at Copenhagen (1807) and at Walcheren (same year), also in the passage of the Adour and at the battle of Leipzig (1813). But perhaps the most far-reaching achievement of the war rocket during this period was at the battle of Bladensburg, Aug. 24, 1814, during the Anglo-American War of 1812. There an intensive fire of rockets directed against Stanbury's U.S. brigade caused the regiments of Schutz and Regan to break and flee. This, when quickly followed by the arrival of British reinforcements, led to an almost general rout, which left the city of Washington unprotected, and led to its immediate capture and burning by the British forces. Likewise in the following month, when the capture of Ft. McHenry in Baltimore harbour was attempted, the rockets, whose "red glare" is so vividly recorded in "The Star-Spangled Banner," were not signal flares, but carried warheads loaded with substantial amounts of explosive—"bombs bursting in air." This time, however, they failed to gain success for their users and of several vessels which had been specially fitted for use as rocket ships on this particular mission, one was sunk with all hands by the fire of a hidden battery, and the rest were forced to withdraw without having gained their objectives.

Congreve's rockets were first made with a tail stick tangentially attached, as in the ordinary skyrocket. But these were hopelessly inaccurate, and were replaced by others with the stick centrally located, with much better results. William Hale, an American, made a further improvement in the Congreve rocket. It was stickless, being stabilized by spin in its flight by an auxiliary combustion chamber, the gases involved in which were liberated from tangential ports (pinwheel effect). The rocket enjoyed no small popularity for many decades. It was used by the Americans in the Mexican War, but periodic tests of rockets left from that war revealed that large numbers of them blew up. Eventually by military order they all removed from storage and destroyed.

The modern rocket has its origin in the research work carried out by Dr. Robert H. Goddard, head of the physics department of Clark university. Dr. Goddard was interested in reaching extremely high altitudes and showed that this could not be done with a projectile fired from a gun and that the rocket furnished an ideal means of accomplishing the objectives. He first experimented with powder as a propellant and showed that, by adding a tapered nozzle and making the rocket motor strong enough to withstand higher pressures, the efficiency could be greatly increased. During World War I he was granted government funds under the control of the Smithsonian institution to develop long-range rockets for military purposes. The research work was started at Worcester Polytechnic institute but later moved to Pasadena, Calif., the shops of the Mt. Wilson observatory being made available to Goddard for the work. Single-charge rockets propelled by double-base powder (40% nitroglycerin and 60% nitrocellulose) developed there by Goddard and C. N. Hickman were demonstrated at the Aberdeen proving ground, Md., in Nov. 1918. These rockets were fired from lightweight launchers held by hand. The types demonstrated weighed from 1½ to 17 lb. Designs of a 4-in. rocket for firing from planes were also disclosed. The armistice was signed while these demonstrations were in progress. The development work was dropped but Goddard continued his research work on high-altitude rockets with funds donated by the Guggenheim foundation. He dropped the idea of using solid fuels and experimented with liquid oxygen and gasoline as a fuel. He proposed and had patents granted on a number of essential features which were later used by the Germans in their V-2 rockets.

The Germans, the Russians and the English secretly began to develop rocket weapons several years before World War II started. The investigations in England were begun in 1934 (see *Rocket Developments in Great Britain for World War II*). The liquid fuel V-2 rockets developed by the Germans were massive and were capable of travelling more than 300 mi. Some of these rockets weighed more than 12 tons and were 46 ft. long and about 5 ft. in diameter. The fuel consisted of 7,500 lb. of alcohol and 11,000 lb. of liquid oxygen. The warhead weighed 2,100 lb. For a range of 200 mi., they reached a maximum height of 60 to 70 mi. They were launched vertically and the fuel burned for about 65 sec. and produced a thrust of about 68,000 lb. Since they travelled faster than sound, their impact took place before the sound produced by their travel through the air could reach the unfortunate victims. When Goddard proposed rockets of this kind during the years 1914 to 1940, his suggestions were not taken seriously. The Germans also developed assisted shell-type rockets. The shell after being fired from a gun was given still further range by an attached rocket motor.

Rocket Fundamentals.—Contrary to the general belief, the propulsion of a rocket is not caused by the reaction of the gases against the air. Its principle is based on one of Newton's laws, that to every action on any object there is an equal and opposite reaction on some other object. Thus, if M is the mass of the rocket and V its velocity and if m is the mass of the propellant and v its velocity then it can be shown that $V = v \log_e (1 + \frac{m}{M})$ or $V = \frac{mv}{M + m/2}$. The latter equation is reasonably accurate for rockets where m is not more than 50% of M . The velocity of the gas, v , may be appreciably increased by using a tapered nozzle.

The old black-powder rocket was made by packing the powder tightly in a thick paper tube. The burning took place from one end. Most of the World War II rockets used powder in such a form that it burned from all surfaces. In these rockets it was necessary to use powder traps to prevent the stick powder from being ejected. The "Bazooka" rocket had five ¾-in. powder sticks about 5 in. long, which rested against a mushroom-shaped stool trap. The U.S. army 4½-in. rocket had 30 sticks of ¾-in. powder strung on a steel cage trap. The English 3½-in. rocket and the navy 5-in. rocket for use on planes had single sticks which fitted the inside of the motor and had cross sections in the form of a cross (cruciform). These sticks rested against a grid trap.

Many of the German and Russian rockets had seven sticks of powder symmetrically placed, one being in the centre. The sticks were held in place by a suitable grid trap. These rockets, like U.S. and British counterparts, were spin stabilized, the spin being obtained by several canted outlet nozzles.

Rocket Developments in the United States for World War II.—Developments in the United States did not begin until July 1940. The work was started by the National Defense Research committee (NDRC) and placed under the direction of C. N. Hickman, a Bell Telephone laboratories' engineer. His first laboratory was located at Indian Head, Md., and was staffed chiefly by naval employees. Capt. L. A. Skinner had been appointed by the U.S. army ordnance department as a liaison officer with NDRC and spent most of his time in that laboratory. He had read the Goddard and Hickman reports at the army's Aberdeen proving ground and, becoming interested in the subject, had experimented with rockets from 1933 to 1940. Under the direction of Skinner and Hickman, the "Bazooka" rocket was developed by Capt. E. G. Uhl at Indian Head. It was 2.36 in. in diameter, 21.6 in. in length and weighed 3.4 lb. The warhead weighed 1.57 lb. and was of the hollow-charge type, being capable of penetrating 3-5 in. of steel. The rocket was fired from a 4½-ft. launcher which weighed 13.3 lb. The soldier held it on his shoulder and fired it by pulling a trigger. It was extensively used against tanks.

In 1941 the work was expanded by NDRC contracts with the California Institute of Technology, George Washington university, the Budd Wheel company and the Bell Telephone laboratories. Engineers were hired by the George Washington university to work at the Indian Head laboratory, and another rocket research laboratory was established at the California Institute of Technology (C.I.T.) under the direction of C. C. Lauritsen. The "Mousetrap," an antismarine rocket, was developed by this group. This rocket was fired from a four-rail launcher on ships ranging from destroyer escorts to small harbour-patrol vessels. They were equipped with hydrostatically armed contact fuzes and were fired forward in patterns similar to the manner in which the British "Hedgehog" bombs were used. The advantage of the "Mousetrap" was the lack of recoil which permitted it to be fired from small boats.

Forward-firing 3½-in. British rockets were redesigned at C.I.T. for use with U.S. ballistite¹ and were effectively used by planes against ground targets, surface vessels and submarines. The request for a larger-calibre rocket brought forth a 5-in. rocket. It had a velocity of 1,375 ft. per second and weighed 140 lb. It was used for the first time against railroad yards in Paris.

The C.I.T. group also developed a 4½-in. barrage rocket propelled by a 3½-in. motor having a range of 1,100 yd. A 12-round gravity-fed automatic projector was developed for launching these rockets. The request for a larger and longer-range rocket having more accuracy brought the development of the 5-in. spinner. This rocket had a velocity of 800 ft. per second. The development was completed in the fall of 1944 and went into use on LSM-R boats in the Pacific in the spring of 1945. These rockets were fired from these boats at the rate of 500 per minute. They were about 32 in. long and weighed about 50 lb.

The largest rocket developed by this group was "Tiny Tim," a 1,284-lb. rocket launched from planes. The propellant charge weighed 146 lb.

The army ordnance department set up a rocket research laboratory and ranges for proof firing in Oct. 1942 at the Aberdeen proving ground under the direction of H. B. Lemon, professor of physics from The University of Chicago. The ordnance department also developed many rocket launchers. One of these, the 60-tube "Calliope," was mounted on General Sherman tanks and used in the push into Germany. The army 4½-in. rockets which had been developed jointly by the army ordnance and NDRC,

were fired from these launchers at the rate of 120 rounds per minute. After discharging the 60 rockets the launcher could be jettisoned. Similar launchers mounted on trucks were developed for 7.2-in. incendiary and chemical rockets. Many types of rockets were developed by the ordnance department including a 4½-in. which was stabilized by spin. Under contracts with the war department, factories were built to make rocket powders, and high priorities were given to the manufacture of rockets of all types.

Special and improved powders were developed by other NDRC groups. As the work expanded, the Indian Head group of the NDRC was moved to Cumberland, Md., where the Allegany Ballistic laboratory was established and operated by the George Washington university under contract with the NDRC. This laboratory, under the direction of R. E. Gibson, developed a 100-lb. 115-mm. rocket for forward firing from planes. It had a velocity of 1,000 ft. per second and used a special solvent extruded powder developed by that laboratory. Jet-assisted take-off rockets, recoilless guns, mine-clearing devices and powder-pneumatics units for flame throwers were also developed by that laboratory.

Rocket motors for use in assisted take-off of planes, using both powder and liquid fuels, were developed at the Guggenheim Aeronautical laboratory at the California Institute of Technology (GALCIT). That laboratory was under the direction of Theodore Von Karman and Frank J. Malina. The navy department also operated a similar laboratory at Annapolis, Md., with which R. H. Goddard was associated.

So great had been the development of rockets in the United States that on V-J day they were being manufactured at the rate of more than 1,000,000,000 per year. The weights of these rockets ranged from 3 lb. to 1,300 lb., their diameters from 2 in. to 12 in., their lengths from 1 ft. to 10 ft., their velocities from 65 ft. to 1,500 ft. per second, their burning time from .01 sec. to 2 sec. and their maximum ranges in ground firing from 40 yd. to 10,000 yd. Their accuracies, in terms of probable angular dispersion, varied from 1° to 3°. They were being fired from the shoulder, from tanks, small boats, planes, trucks and tripois. Rockets having very large fins were also being used as targets for training anti-aircraft gunners. (C. N. H.)

Rocket Developments in Great Britain for World War II.—In Dec. 1934 Sir Hugh Elles, master general of ordnance, called a meeting at the war office to "review our present knowledge of rockets in general." The organized development of modern war rockets in Great Britain dates from July 1936, when it was decided that the potentialities of rockets should be investigated for: (1) anti-aircraft defense; (2) long-range offense; (3) as recoilless armament in aircraft; (4) for assisted take off of aircraft.

After a formative period in the research department of the royal arsenal, the research work was entrusted to A. D. Crow (later Sir Alwyn Crow), at that time the director of ballistics research. For security reasons the investigations were referred to as "Projectile Development" and rockets were known as "U.P.s," abbreviated from unrotated projectiles. A relatively small but technically powerful team of research workers in the ministry of supply was organized by Crow in two interdependent units, working secretly in remote parts of the country. The firing range section under William Blackman, responsible for rocket-firing experiments, built up an elaborate observational and recording system over a 20-mi. stretch of the west coast of Wales, and progressively installed firing batteries, ammunition magazines, engineering workshops, scientific laboratories and administrative offices at the projectile development establishment, Aberporth, Cardiganshire. The planning and development section, responsible for all phases of the investigations leading up to the range work, was housed, at first, in cottages and huts adjacent to Fort Halstead, built during the Napoleonic Wars on the top of Poi hill, near Sevenoaks, Kent, against the threat of French invasion. The underground casemates of the disused fort served as magazines for the storage of explosive materials and, though less conveniently, as assembly and testing rooms for the experimental rockets whose evolution was most vigorously proceeding. New buildings of all sorts, needed to enable rocket development to proceed on an adequate scale,

¹The term "ballistite" refers to a mixture of nitroglycerine and nitrocellulose with sufficient plasticizer and stabilizer to render it workable and safe. The actual percentage of nitroglycerine was about 40 and the percentage of nitrocellulose about 60. Thus it is known to be a "hot" powder. British cordite may have as much nitroglycerine but it has a considerable amount of neutralizer added which slows down and renders the powder less hazardous to extrude.

were planned and put under construction in the woods surrounding the old fort, but they were never used by the rocket group. The cumulative weight of inconvenience and upset from the activities of hundreds of workmen, added to the threat of German aerial attack, forced the temporary abandonment of the site near London and the whole team was concentrated at Aberporth. But this phase was short; the need for close and continuous contact between the new organization and the older armament and ordnance establishments and with the policy-making departments of the war office and the admiralty forced an early regrouping.

Within four months new arrangements had been settled and implemented and although from time to time they were modified in detail, in principle they were maintained throughout the succeeding six years, including more than five years of World War II. The rocket organization which stood through the war years thus comprised a planning and policy section at headquarters in London, and a self-contained projectile development establishment at Aberporth with scientists, engineers, draughtsmen, mechanics and administrative staff covering applied research, development, experimental manufacture and range firings of rockets. The whole undertaking was under the charge of Sir Alwyn Crow as director of projectile development, whose responsibility was briefly defined as "research, development and production of rockets." The headquarters section comprised a military adviser, a naval adviser and four assistant directors of projectile development; planning and ballistics, propellents and explosives, co-ordination of design and preproduction and production. The establishment at Aberporth was under the local charge of a chief superintendent, William Blackman.

It adds something in perspective to recall the degree of interest which rocket development had attracted by 1940, and which was sustained thereafter. It was typified by the attendance of Prime Minister Winston Churchill at several rocket-firing trials, and his insistence, for more than a year, on a personal weekly report of progress in rocket development. In this he was encouraged by his scientific adviser, Frederick A. Lindemann, later Lord Cherwell, who maintained the closest touch with every new phase of the developments and was the sponsor of several weapon applications of rockets, notably the rocket-propelled aerial mine.

An attempt may now be made to trace the progress in development of actual rocket weapons. Although four main objectives had been laid down originally, it transpired that for a time the whole of the limited resources available for rocket research was directed toward the successful development of rockets to supplement anti-aircraft guns.

The smallest propellant charge which it was thought would produce an efficient rocket had an outside diameter of 2 in. and the largest charges which existing cordite presses could extrude had a diameter of 3 in. These two calibres were chosen for trial and their selection was to influence the whole wartime future of rocket development.

The arrangement of the propellant charge in these early rockets was one to which postwar work reverted, although it was temporarily discarded in the successfully developed wartime rockets. It was at first believed impossible that the thin steel tube could survive the period of burning of the charge if the propellant gases, at a temperature of about 2,500° C., were allowed to come in contact with it. To avoid this, it was decided to burn the propellant on its inside surface only, and this involved the problem of inhibiting burning on the outside surface without seriously reducing the density of loading. Development was therefore put in hand of a suitable material having plastic properties to fill the narrow annulus between the propellant and the motor body, the intention being that the plastic should adhere strongly enough to the surfaces to exclude propellant gases, and at the same time be capable of flowing under the stresses caused by temperature changes, while retaining its shape and position under the stress caused by the weight of the filling. By making the internal contour of the charge of star section it was possible to obtain an almost constant burning surface, and also to adjust the time of burning within limits.

Preliminary static firing experiments were carried on by firing a

rocket firmly held in a thrust-measuring block, hence without forward motion. With the onset of colder weather in the latter half of 1937 it became apparent that the development of a satisfactory material for the "plastic surround" had by no means been achieved. One of the chief difficulties was the effect of nitroglycerine which it absorbed from the propellant, and which altered the plastic properties on storage. Before starting on what might be a long research, it was decided to see what would be the effect of firing a plain charge loose in an unprotected tube, and at the same time to work out possible processes for applying a heat-insulating coating. The first 2-in. rounds were fired in Feb. 1938, using a plain cylindrical tube of propellant supported on a fabricated steel cross, which acted as the grid (powder trap). Given sufficient clearance between the propellant and the steel tube, this arrangement was unexpectedly successful, and a few experiments showed that malleable cast-iron grids could be made to stand up to the most severe conditions.

The problem of the insulating coating was overcome, after a tedious series of experiments, by spraying the inside of the tube with a suspension of finely ground alumina in a solution of sodium silicate. This process was industrialized and the refractory coating was successfully applied to several millions of 3-in. rockets. Although the thickness of the coating was only 0.008 in., the reduction in wall temperature at the end of burning was found to be of the order of 300° C., resulting not only in prevention of burning-out of the tubes but in the achievement of a significant improvement in accuracy.

Toward the end of 1938 sufficient progress had been made to justify a comprehensive series of firings designed to provide statistical data on performance and dispersion and fuze-scale data. The impending English winter, with low clouds making observation of positions of burst impossible for most of the time, led to the decision that these firings should be carried out in Jamaica, and during the first few months of 1939 about 2,500 3-in. rockets were fired in an extensive series of ballistic trials.

The results failed to satisfy the general staff. The performance and accuracy of the 3-in. rocket compared badly with those of the recently developed 3.7-in. A.A. (anti-aircraft) gun. The staff wished the development work to proceed in the hope that accuracy approaching that of the gun would be achieved, but they did not propose to adopt rockets in the service. Even after World War II started, the war office felt that it would be premature to introduce the new weapon. Contrary to expectations, there was practically no hostile air activity over England during the first few months of the war, and the provision of 3.7-in. A.A. guns was proceeding well.

However, by early 1940 a new situation had arisen. It became apparent, soon after the war started in Sept. 1939, that the German dive bomber constituted a serious menace on sea and land. By the end of September the admiralty was sufficiently impressed with the need for testing every possible counter that it demanded the speedy development of a rocket-propelled aerial mine for the protection of ships and harbours. A parachute and wire device, intended for dropping from fighters in the path of oncoming bombers, was in course of development by the air force. This was modified to withstand the setback shock imposed during rocket acceleration and the shock of unspooling at high speed, and a new 3-in. calibre rocket was developed to project it to the required height. On the whole the project was not especially successful or important, but it demonstrated the potentialities of the rocket as a carrier of relatively bulky and fragile devices and the possibility of firing large salvoes without large recoil forces. It was also the forerunner of several other wire devices, projected by rockets.

A second development, also directed against the dive bomber, assumed considerable importance at this time. Much thought had been given to the idea of a proximity fuze and there was promise of success with a device which comprised a photoelectric cell coupled to a thermionic amplifier. The arrangement was such that the image of a nearby aeroplane, projected on the cell by means of a lens, caused a sufficient change in emission from the cell to produce a pulse capable of amplification to trigger a thyatron, or gas-relay, in circuit with the high-tension battery and the

detonating train of the shell. Switches were included to keep the devices inert until after it had been subjected to rocket acceleration and it could therefore be fired at an approaching aeroplane in the knowledge that the shell would detonate at the instant when it passed sufficiently close to "see" it. The optical system was so designed that this instant coincided with the most favourable position of the shell to cause lethal damage, whatever its distance or orientation from the aeroplane. Firing at a dive bomber, approaching along the line of sight, should have produced an almost certain kill with such a fuse. The projector could be simple; there would be no recoil forces and laying need take account only of wind deviation. The delicate construction of the fuse, and its bulk, precluded the use of conventional artillery but the 3-in. rocket seemed an ideal vehicle.

By the spring of 1940 many of the technical difficulties had been overcome and the weapon was sponsored jointly by the army and the navy. A period of intensive design and production followed. A design was put forward for a projector so cheap and simple that it could be built in large numbers with no elaborate facilities, and used by personnel with little or no military training. The result was the Projector, Rocket, 3-in., No. 1, Mark I, of which several thousand were made during 1940 and 1941. The design was basically simple and presented no difficulty, but a good deal of experimental work was needed to provide adequate shielding of the crew from blast reflected from the ground when firing at high angles of elevation, and also to produce simple and reliable electrical-firing contacts. In Nov. 1940, the manpower situation led to the design of a twin projector on similar lines (3-in., No. 2, Mark I) incorporating a number of improvements which experience with the single version showed to be desirable.

Meanwhile, the photoelectric (P.E.) fuse was completed, and manufacture on a considerable scale was initiated. Using fuzes from production, by this time reduced in size to a diameter of 3½ in. and a total weight, including batteries and detonating train of less than 10 lb., a final clearance trial was carried out, firing at glider targets suspended from barrage balloons. The results of the trial were satisfactory but new factors intervened. The menace of the dive bomber had already begun to decline and certain limitations on its more general use, inherent in the nature of the fuse, were increasingly recognized. Chief among them were its inability to function at night or at dawn and dusk, and its susceptibility to direct sunlight when fired in certain directions in relation to the sun. Reluctantly, the fuse was abandoned, but the phase of its development had been one of such intense activity and interest in the rocket field that the services were, by now, thoroughly rocket-conscious and proximity fuzes of one type or another had come to stay. The radar fuse, initiated at Aberporth at the same time as the P.E. fuse and developed to a successful conclusion in the United States, was the postwar version of the device.

The 3-in. rocket then reverted to the role originally intended for it, that of supplementing the heavy gun defenses. Thus was the 3-in. rocket, through the vicissitudes of 18 months of war, finally established as a service weapon. During the same period the 2-in. rocket had established itself in the navy. It was used in several different roles: with high explosive (H.E.) heads, fired from three different types of projectors of which the 20-barrelled "Pillar Box" was the best; with flare or star heads, fired from projectors mounted on gun-shields to permit continuous illumination concurrently with continuous lethal fire; with parachute and wire devices to project new and improved types of aerial mine as a counter to low-level bombing. In all these applications it was used in merchant vessels as well as royal naval craft.

The original 5-in. rocket had also completed its development, initiated in Nov. 1939, to meet a demand for a weapon suitable for handling in slit trenches but capable of projecting a 30-lb. light-case bomb to a range of 2 to 4 mi. with reasonable accuracy. To meet the handling requirement, the projector could not exceed 6 ft. in length. This restriction permitted only a short travel for the round; the demand for accuracy required a fairly high velocity, and therefore high acceleration, to ensure stability at launch, and precautions were required against ejection of unburned slivers of cordite which would produce equivalent variations in range.

These factors, combined with the modest ballistic performance required, account for the rather unorthodox design of the round. The propellant charge was composed of 11 tubular sticks of cordite, giving a large burning surface with consequent high thrust, disposed in the annular space between the rocket body tube and an internal axial tube, perforated to allow free flow of gas but preventing loss of cordite. Although, by present-day standards, the dispersion of this rocket is not particularly good, it does seem that the charge design has the desired effect, for the performance index¹ is high, and the unknown factor of dispersion is low. The rocket was never used for its original purpose, but it provided the basis upon which the naval beach-barrage weapon was developed in 1944.

The difficulties of production during World War II imposed such restrictions on the supply of high-grade rocket tubing as to preclude the development of calibres other than those already described. As a result, every new rocket requirement had to be met by the adaptation of 2-in., 3-in. or 5-in. rocket motors. In all, about 22 different rocket weapons were approved for the British services during the war, but it would be tedious to describe them all and more profitable to refer to such types and uses as emphasize best the characteristics peculiar to rockets.

The 3-in. anti-aircraft rocket has been described. It owed its adoption to two main features: the fact that the projectors could be manufactured cheaply, in large numbers, by engineering firms inexperienced in armaments and employing a large proportion of unskilled labour; and the fact that it was a suitable vehicle for the projection of delicate and bulky apparatus, although in the event this characteristic was only applied to the shell, containing more than 25% by weight of high explosive, and not to the fuse. The rocket ammunition cost about the same in man hours and skill as equivalent gun ammunition.

The use of rockets from aircraft had been contemplated in 1936 when the first organized attempt at rocket development was initiated. The outstanding characteristic involved in this usage was the absence of recoil forces in rocket firing. Whereas with gun armament in aircraft the maximum calibre is strictly limited by the recoil stresses which must be absorbed in the aircraft structure, with rocket armament the calibre is limited only by convenience in stowage and the avoidance of damage from blast. In Oct. 1941, the Ordnance board pressed the suggestion that rockets might be fired from aircraft against tanks. It was decided to start trials using the 3-in. anti-aircraft rocket motor, fitted with an armour-piercing head, fired from beneath the wing of a Hurricane aircraft. A variety of applications developed from this starting point and many different types of aircraft, both British and U.S., were equipped with rocket-launching apparatus for firing 3-in. rockets, adapted for the purpose from the original anti-aircraft model. Armour-piercing and high-explosive shells were employed, of calibres varying up to 6 in. To emphasize the main feature of this application, it may be observed that the regular equipment of a rocket-armed single-seat fighter aircraft enabled it to deliver a salvo equal in hitting power to that from a contemporary light cruiser.

The various wire-barrage weapons relied upon two main rocket characteristics. The first project, known as the Naval Wire Barrage or Apparatus, Aerial Defence Type B, depended on the capability of rockets for conveying fragile and bulky apparatus, without the imposition of damaging setback and centrifugal forces inescapable in gun ballistics. A more advanced development of the same principle is typified by A.A.D., Type K, in which the parachute and wire device were reduced to the same calibre as the 3-in. rocket, and fitted to the standard anti-aircraft rocket motor, for laying the barrage at greater heights, up to 20,000 ft.

Two other wire-barrage weapons, A.A.D., Type J, and A.A.D., Type L, operated in a different manner. The requirement here was that the barrage should be fully effective in the shortest possible time. It must be completely erected after five seconds,

¹Performance index = $\frac{\text{thrust} \times \text{time (lb. sec.)}}{\text{charge weight (lb.)}}$

A measure of the efficiency of the charge and nozzle combination, sometimes called "specific impulse."

U.S. AND BRITISH WAR ROCKETS DEVELOPED DURING WORLD WAR II

1. 9-Barrel projector for 3-in. A.A. rockets in action. The picture shows rockets in flight just after leaving the projector. Normal procedure with this type of projector is to fire rippled salvos of three rounds each.
2. Aircraft rocket installation in Coastal command Bomber. The 3-in. rockets shown are fitted with solid armour-piercing heads. Each projector consists of a pair of parallel rails, close together, and each rocket is provided with two saddles which act as supports and

guides. Four rockets are carried under each wing and they can be fired in salvos of 2, 4 or 8.

3. Twin projector for 3-in. A.A. rockets. The photograph shows the elevating hand wheel on the right-hand side of the projector and the traversing handle on the left. The blast shields are fitted with armoured glass gratings. The double elliptical ring at the rear end of the projector rails serves as a balance weight as well as a structural member.

but only modest heights need be catered for. The object was to counter low-level bombing, and machine-gunning of merchant ships. Fire was to be withheld until the enemy had committed himself to his bombing run, which involved a low level passage over, or very near to, the ship. The barrage was to be erected quite close to the ship. If the attacking aircraft saw it in time to take effective avoiding action, he must necessarily abandon the attempt to bomb; and if he persisted, he was in great danger of suffering lethal damage.

In one type, both the parachutes and the cables were contained in a canister fixed to the projector in the ship. The rocket, towing the top half of the canister containing the support parachute, and unspooling the cable behind it, attained the requisite height in a few seconds, at which point the support parachute was ejected and opened, and the mine floated slowly down. In the other type the support parachute was carried ahead of the rocket but the cable was again unspooled from the fixed canister. The rocket characteristics employed in these devices were the low starting velocity and steady acceleration, permitting the wire to be picked up without snatch and unspooled without damage. The ease of manufacture of the projection apparatus, as compared with guns, and the absence of recoil, were also influential.

Later in the war, when invasion of enemy-occupied territory was contemplated, the potentialities of rockets for laying a mass barrage were investigated. In Sept. 1942 a meeting had been held at combined operations headquarters to discuss the lessons of the Dieppe raid. The main conclusion of that meeting was that the beaches and the land overlooking the beaches must be drenched with the maximum amount of H.E. shell that could be made available immediately before the landing took place. Experience had shown that, in spite of the greatest care and preparation in the identification of enemy batteries and machine guns, and in the organization of aimed fire from naval guns or aircraft, many of the enemy's weapons would be unlocated. The dust and smoke of battle would make it difficult to engage these targets after the attack had been launched. The proposal was made that special craft should be fitted out with a large number of 5-in. rocket projectors capable of drenching an area with medium-weight H.E. shell during the period immediately before the landing took place.

Work was started at once, using the army 5-in. rocket weapon as the starting point. A new high-capacity shell was designed to give the best possible fragmentation effect by taking advantage of the low setback forces from the rocket. A sensitive impact fuze was provided, to ensure the least possible cratering, and the rocket motor was altered and improved in several respects. Sextuple projectors, made for the army from the original single-barrel light-weight projector, were adapted and fitted in large banks in the selected craft. The rockets were fired automatically in rapidly successive groups, to reduce the chance of mutual interference, and in the form eventually used a single rocket ship was able to discharge highly lethal ammunition on the chosen target area at a rate of half a ton a second for nearly a minute at a time. The craft were first used in 1943 at the landings in Sicily and Italy, and they were conspicuously successful.

The rocket characteristics so outstandingly demonstrated in this application are the simplicity, lightness and cheapness of the projectors and the absence of recoil. A later counterpart of this weapon for land service, and known as the "Land Mattress," exemplified the same features. Each projector mounted 30 barrels and had an all-up weight of little more than 1 ton. They could be towed easily by a three-ton ammunition truck and, for short distances into action, could be towed fully loaded. This weapon was used with great success by the Canadians in crossing the Scheldt river and later by the 2nd army in crossing the Rhine. The projectors can be lightened and decreased in size so that they can be towed by a light motor vehicle and can be carried by aircraft without dismantling.

Mention has been made of star and flare heads, used with rockets, and of the naval practice of attaching light rocket projectors to a gunshield so that the gun is continuously available for lethal fire. Another aspect is worth noting; namely, that a flare for projection by a rocket can be constructed much more lightly

than its gun counterpart because of the absence of setback and spin, with the result that, for equal weights projected, a brighter and longer-burning flare can be provided. Flares have also been made for rocket projection from aircraft. They are used for the detection of submarines and surface craft by night and, so that the pilot may not be blinded by the light from his own flare, they have to be fired with an upward lift to the trajectory, a problem which took some time to solve.

A variety of other uses have been made of rockets, mostly employing characteristics which have already been described. Ropes, ladders, grapnels, stores and depth charges are among the items for which rocket projection has been used, and bombs required for very deep penetration have been accelerated by rocket action. By varying the shape, and therefore the burning surface, of the charge, and the pressure at which it is burned, the time of burning can be altered over a wide range to procure the conditions most appropriate to the problem in hand, even with the restricted tube diameters imposed by war conditions. To illustrate this feature, the case of the 5-in. rocket may be quoted. As originally designed for high acceleration, with a charge composed of a number of small diameter tubes of cordite, burning freely on their whole surface, a thrust of about 20 tons is developed and burning is completed in about $\frac{1}{4}$ sec. At the other extreme, by encasing a solid stick of cordite in an inert material so that burning takes place cigarwise from the end face only, a thrust of the order of 50 lb. can be obtained for periods, governed by the length of charge employed, of 60 sec. or more. It will immediately be obvious that this possibility opens up an entirely new set of applications in which liquid propellants compete with, and sometimes supersede, the solid type. The propulsion of gliders, torpedoes and small boats has been achieved in this way and, in appropriate circumstances, the assisted take off of aeroplanes. It is well to observe, however, that in these applications, where the velocity attained is very low compared with the efflux velocity of the rocket gases, the efficiency of the unit is low on a fuel consumption or horsepower basis. The attraction of the method lies in its potentiality of providing a substantial propulsive force for a limited period, at very little expense in weight carried. An obvious application is the use of rocket motors to boost the speed of aircraft for short periods and, if desired, the spent rocket can be jettisoned after use.

It is necessary to distinguish between rocket propulsion proper, where the fuel and oxidant are both carried with the motor, and the Turbojet or propulsive duct systems where only the fuel is carried and entrained air is employed as the oxidant. In these cases a much higher fuel economy can be achieved, but there are many other factors to be taken into account in the choice of a system for any particular application. (W. H. WH.)

Other Rocket Developments for World War II.—The Germans, the Russians and the Japanese developed and used many rocket weapons. The German jet-propelled V-1 plane and the liquid-fuel V-2 rocket inflicted great punishment on the British.

At the close of the war, thousands of engineers were working on rockets in the respective countries. The Japanese had developed a large powder-driven rocket to increase the velocity of their suicide dive-bomber glider plane. The Russians reportedly saved Stalin-grat by the terrific rocket barrages used against the Germans.

The rocket principle was widely used during the war for other purposes than hurling high-explosive heads. The thrust caused by jets was used to assist heavily loaded planes in getting off the ground and to propel aeroplanes. The German V-1, while not a true rocket, was a small gyroscopically guided plane, propelled by successive ejections of gas from a combustion chamber. The fuel consisted of alcohol carried in tanks, combined with air admitted through flap valves in the front of the combustion chamber. The burning of powder gases was utilized to pressurize flame throwers and fire extinguishers.

The rocket principle was used to make guns recoilless, the breech end being fitted with a nozzle so that the escaping gases gave a forward thrust to the gun which was equal and opposite to its recoil. Utilizing this principle, guns, firing 25-lb. shells, were reduced in weight to a point where they could be mounted on 30-calibre machine-gun tripods. One type of recoilless gun could be broken into 3 pieces each weighing 60 lb. or less so that, disassembled, it could readily be carried

by 3 men. It required less than two minutes to put it in operation. Although the propulsion efficiency of rockets is low, they were extensively used, their advantages being that the absence of recoil makes it possible to fire large-calibre shells from relatively light-weight launchers. Such launchers may be mounted on small boats, vehicles and planes or may be carried by one or more soldiers. The relatively low acceleration of rockets permits them to carry special fragile fuzes, cables, etc. They may be manufactured in shops which are not suited for making guns. (C. N. H.)

Lifesaing Rockets.—The use of rockets for carrying lines from ship to shore and vice versa, on the occasion of marine disaster, appears to date from 1831 when Tregrove's British apparatus—a simple 8-oz. skyrocket, was advanced for the purpose. It met little success, however, and was succeeded in 1832 by Dennett's—a much more substantial contrivance weighing about 23 lb. Made with an iron case instead of the conventional paper shell, and guided by a stick 8 ft. long, it had a range of 250 yd. Commencing in 1834 the British board of customs undertook the issue of these to many lifesaving stations. Later, 1842, the Carte rocket, an adaptation of the Congreve war variety, had a brief vogue. The next development was an improvement by Dennett on his original design. This involved the mounting, side by side, of two rockets attached to the same stick. The range was thus increased to 400 yd., but the impossibility of achieving an equal burning rate on the part of the two constituents led to its final abandonment. About this time Henri Gustave Delvigne, famous for his improvements to rifled small arms, produced a "life-arrow" to be fired from an ordinary musket. This was capable of hurling an 18-oz. mahogany stick, with a mackerel line attached, to a distance of 80 yd. But all earlier forms were superseded by one devised by Colonel Boxer of the British Royal laboratory. His rocket consisted of two separate units incorporated in a single tube—one behind the other; and a partition in the body separated the two charges. When the energy of one had been expended, the other became automatically ignited, the resultant maximum range materially exceeding that achieved when two separate rockets were lashed side by side (Dennett fashion) or when the double load was fired in the form of a single charge. Though favourably received and employed, in England and on the continent, none of these devices ever gained much favour in the U.S., where line-firing mortars were generally preferred for lifesaving purposes.

Special Types.—Rockets designed to attain tremendous altitudes in connection with meteorological studies, etc., have long been, and continue to be, the object of experimentation by many physicists. Motor cars and aeroplanes propelled on the rocket principle have also received consideration. (See also FIREWORKS.)

ROCKFORD, a city of northern Illinois, U.S., on the Rock river, 17 mi. S. of the Wisconsin line and midway between the east and west boundaries of the state; the county seat of Winnebago county. It is on federal highways 20 and 51, has a public airport and is served by the Burlington route, the Chicago and North Western, the Chicago, Milwaukee, St. Paul and Pacific and the Illinois Central railways, and by motorbus lines in all directions. Pop. (1950) 92,927; it was 84,337 in 1940 by the federal census. The city occupies 14 sq.mi. on both sides of the river, and has 1,490 ac. in parks and playgrounds. On a wooded bluff, in a beautiful campus of ten acres, stands Rockford college, one of the oldest standard colleges for women in the United States, opened as a seminary in 1847. Enrolment is limited to about 650. The public schools have an enrolment of more than 14,000,

and the parochial schools 2,000. There are many churches in the city, and a Roman Catholic pro-cathedral. Rockford has been an important manufacturing centre since its earliest days. Water power is supplied by a dam 800 ft. long, built in 1844. There were more than 400 manufacturing establishments at mid-20th century; important products are machine tools and dies, machinery, furniture, textiles, automobile parts, stoves, hardware, hosiery, leather and paint. Bank deposits and postal savings on June 30, 1950, totalled \$129,251,745.73.

Rockford was founded by New Englanders in 1834 and was chartered as a city in 1852. Rockford is a great machine-tool manufacturing centre. A million men passed through Camp Grant 4 mi. S. of the city during World War I. Again in World War II the camp was a huge reception centre for conscripted men and a large medical replacement centre.

ROCKHAMPTON, a seaport on the east coast of Queensland, Austr., situated on both banks of the Fitzroy river at the head of ocean navigation 35-40 mi. from the sea. The Fitzroy and its tributaries (Dawson, Mackenzie, etc.; maximum length 520 mi.) drain a basin of 50,000 sq.mi. of great diversity and economic value. The hinterland of Rockhampton thus includes extensive high-class pastoral areas extending at least as far west as Longreach (428 mi. by rail); rich agricultural and dairying lands which include the Dawson river irrigation area (total projected area: 200,000 ac.), besides large mineral resources including coal fields (e.g., Blair Athol mines). Around Rockhampton itself is a fertile agricultural area producing tropical fruits, maize and dairy products. The climate is hot and humid but not unhealthful (average annual temperatures, 82°-84° F.; average annual rainfall, 110 in., falling within about 44 days of the summer). The town, pop. (1947 census) 34,988, is well designed, has wide streets, many substantial buildings (including two cathedrals) and possesses good water, gas, electricity and tram services besides fine public parks and gardens. The harbour (wharfed 2,000 ft. with 8-20 ft. alongside) has been improved at considerable expense and is kept open by dredging for vessels of 18-20 ft. draught. Difficulties are the shifting sand and mud banks caused by severe floods which are liable to occur during summer. Rockhampton is base of a branching inland railway system which taps the widely separated Longreach (428 mi.), Welford (520 mi.), Blair Athol (240 mi.), Springsure (206 mi.), and other centres, and which is being continually extended. Along the coast the Great Northern line links Rockhampton with other coastal towns, with Brisbane, with various seaside resorts (Ennu Park, Yeppoon), and the ports of Gladstone (c. 80 mi.) and Emerald by Port Alma, to which ocean vessels resort. Railway repairing and other industries are carried on in the town and near by are large meat-preserving and freezing works. In value of its trade Rockhampton is the second port of Queensland.

Mount Morgan, 24 mi. S.S.W., became one of the richest gold mines in Australia after 1885.

Wowan, in the same district, is the centre of the cotton region of Australia.

ROCK HILL, a city of York county, South Carolina, U.S., 27 mi. S. of Charlotte, N.C., on federal highway 21 and two lines of the Southern railway. The population in 1950 was 24,502; 15,009 in 1940 by the federal census, with an additional 5,000 in the immediate suburbs. The city lies at an altitude of 670 ft. The major industry is textile manufacturing. In 1948 there were 14 industrial establishments which manufactured products valued at more than \$20,000,000. Winthrop, the state college for women (founded in 1886 by David Bancroft Johnson, who remained its president until his death in 1929, and chartered in 1891 as a state institution), has an enrolment of 1,500 and a plant valued at more than \$6,000,000. Rock Hill was incorporated as a village in 1870, as a city in 1892. It has a commission-manager government.

ROCKINGHAM, CHARLES WATSON WENTWORTH, 2ND MARQUESS OF (1730-1782), twice prime minister of England, was the son of Thomas Watson Wentworth (c. 1690-1750), who was created earl of Melton in 1733 and marquess of Rockingham in 1746. The family of Watson was descended from

It is an important bright leaf tobacco, cotton, peanut and live-

stock market. Rocky Mount has the oldest cotton mill in the state (established in 1813) and various other manufacturing plants. It operates under a council-manager form of government and owns its power plant, gas plant and water plant.

Rocky Mount was incorporated as a town in 1867 and as a city in 1907.

ROCKY MOUNTAIN GOAT (*Oreamnos montanus*),

a North American hollow-horned ruminant of the family Bovidae, distinguished by its whiteness. It is the only ruminant, with the exception of the white Alaskan wild sheep, which is entirely white at all seasons of the year. In the winter coat, the hair is long and pendent, especially on the neck and chest, and elongated into a short beard on the sides of the lower jaw behind the chin; at the base of the long hair is a thick, woolly underfur. In summer the coat becomes comparatively short. The muzzle is hairy, the ears are of moderate size, and the tail is short. There is a large globular gland at the base of each horn. The black horns, ringed in their basal portion, are comparatively short and not unlike those of the Asiatic serows, in being subcylindrical and curving slightly backward. The lateral hoofs are well developed. The cannon bones are remarkably short and wide. The shape of the animal is ungainly, owing to a huge hump on the withers, at which point the height is about three feet. The affinities of the white goat are with the goat antelopes, the group which includes also the chamois and the Asiatic serows (qq v.).

See Madison Grant, "The Rocky Mountain Goat," published in the 9th *Annals Report of the New York Zoological Society* (1905).

ROCKY MOUNTAINS, THE, are the principal division of that vast system of highlands occupying the western third of the United States and a narrower belt in western Canada. Standing between the great continental plains on the east and the region of elevated basins and plateaus stretching from Nevada to central British Columbia on the west, they constitute the backbone of the continent, as well as a major topographical feature of the entire globe.

At the south, the Rockies first become prominent in northern New Mexico where there are elevations above 13,000 ft. Thence they sweep for 2,400 mi. through the United States and Canada to the Yukon. In Canada, for 450 mi. they form the boundary between Alberta and British Columbia, where they are known as the Canadian Rockies. Their greatest width and elevation are attained in Utah and Colorado. There the system of ranges is 300 mi. across. In Colorado there are 46 summits surpassing 14,000 ft., Mt. Elbert (14,431 ft.) being the highest of the system and the second highest peak in the United States. Colorado contains about 254 mountains between 13,000 and 14,000 ft. Northwest of Colorado breadth and elevation diminish, until at the Canadian boundary the ranges are less than 100 mi. wide, with few elevations exceeding 9,500 ft. From Colorado almost to the Peace river in British Columbia, the Rockies carry the watershed of the continent—the continental divide. But this does not mean that they present a continuous chain of great peaks. On the contrary the zone of uplift is rather a vast complex of separate ranges, interrupted at places by wide gaps of lofty rolling plateaus.

In the United States, the crestline of the Rocky mountains definitely breaks down at two places—the plateaus of Yellowstone park and Great Divide basin in southern Wyoming (60 mi. by 100 mi.). The three divisions thus produced—north, central and southern—may be taken as a convenient basis of description. They correspond approximately with the states of Montana, Wyoming and Colorado (with which Utah is associated). The elevations of these major breaks or passes are as follows: in

ROCKY MOUNTAIN GOAT (*OREAMNOS MONTANUS*)

southern Arizona, 4,615 ft. (Southern Pacific railroad); in New Mexico, Campbell's pass, 7,250 ft. (Santa Fe railroad); in Great Divide basin, 7,103 ft. (at Creston, Union Pacific railroad); in Yellowstone park plateaus, about 8,300 ft.

The Southern Rockies.—The Rockies of Colorado are dealt with elsewhere. (See COLORADO; NATIONAL PARK SYSTEM, THE.) The most magnificent groups are probably the Sawatch range (80 mi. by 20 mi.) and the Sangre de Cristo range (40 mi. by 10 mi.) in the central part of the state. In the southwestern corner the Elk, San Miguel (with the spectacular Lizard Head, 13,136 ft.), Needle and other groups, form a wild and rugged mass of peaks.

The Wasatch mountains of central Utah, overlooking the great basin for 100 mi., present abrupt ranges, of which Mt. Delano (12,240 ft.) is the highest. Associated with the Wasatch mountains is the Uinta group (150 mi. by 25 mi.), of which Kings peak (13,498 ft.) is loftiest. Five others exceed 13,000 ft.

The Central Rockies.—The ranges just mentioned connect with the main axis of elevation of the Rockies in the region of Yellowstone park through a belt of rather indefinite uplands running north and south along the western boundary of Wyoming. There are the Crawford mountains, the Wyoming range, the Gros Ventre mountains, the Snake River range and the Teton range. The Teton range presents perhaps the most splendid spectacle of all the Rocky mountain ranges. It is 40 mi. long and 10 mi. wide, rugged and precipitous. Granite spires rise abruptly 6,000 to 7,000 ft. above the flats of Jackson's Hole. The principal peaks are the Three Tetons (Grand Teton, 13,747 ft.) and Mt. Moran (12,800 ft.) at the northerly extremity.

Reverting to the continental divide of the western part of Wyoming, the important uplift of the Wind River range is next in order, northwest of Great Divide basin. It is about 100 mi. long, the core being upward of 13,000 ft. in elevation and sending out long lateral ridges between which remarkable canyons occur. Its most prominent summits are Fremont peak (13,730 ft.), ascended in 1842 by John C. Frémont; Gannett peak (13,785 ft.), the highest in Wyoming, and Chimney Rock (13,340 ft.). Numerous small glaciers are on the northeast slopes. The largest, Diablot, covers several square miles. The scenery and mountains are distinctly alpine in character, with many fine waterfalls and lakes.

Northeast of the Wind River range, across the Big Horn basin, lie the Big Horn mountains, a prodigious offshoot of the main range towards the great plains, 120 mi. long and 30 to 50 mi. wide. The axis averages from 11,000 to 13,000 ft. in elevation, rising some 9,000 ft. above the neighbouring prairies. A few of the peaks surpass 13,000 ft. and bear small glaciers in their rugged amphitheatres. The highest is Cloud peak (13,165 ft.).

The Northern Rockies.—Between the northern boundary of Yellowstone park and the Yellowstone river, the Beartooth and neighbouring ranges display what are probably the principal mountain masses of this division. In the vicinity of Mt. Cowen (11,190 ft.) and Emigrant peak (10,969 ft.) the relief becomes as great as 6,400 ft., and Granite peak (12,850 ft.), the highest mountain in Montana, is situated there, as are Grasshopper glacier and other small ice bodies. The Beartooth range has a score of summits of 12,000 ft. or more.

The continental divide, however, leaves Yellowstone park in a northwesterly direction. At the 114th meridian it swings off abruptly to the northeast through the Butte and Helena districts. Beyond this swing, the western axis of elevation continues northward as the Bitterroot mountains to within 125 mi. of the Canadian border. They form the boundary between Idaho and Montana, the average elevation being between 7,000 and 8,000 ft. The highest peaks occur on projecting lateral spurs—El Capitan (9,936 ft.) and St. Mary (9,333 ft.). This 125-mi. interval is filled by the Coeur d'Alene (6,000 ft.) and Cabinet ranges, the latter boasting of a glacier on Bear peak (about 9,000 ft.). West of the Bitterroots in central Idaho lies a labyrinth of peaks and ridges (11,000 to 12,000 ft.), Mt. Hyndman (12,078 ft.) being the highest in that state.

In the region of Butte and Helena, the continental divide is generally featureless, the passes around Butte averaging 6,000 ft.

THE ROCKIES IN THE UNITED STATES AND CANADA

1. The Rocky Mountains in the United States: view showing Mount Elbert near Leadville, Colorado, the second peak in the United States in height—Mt. Whitney in California being the highest. The altitude of Mount Elbert is 14,433 feet
2. The Rocky Mountains in Canada: Mount Robson, British Columbia, having an altitude of 12,972 feet

or less. Mullan pass near Helena is 5,870 ft. The Anaconda range contains Mt. Haggis (10,598 ft.) and Mt. Evans (10,635 ft.). Beyond Helena, the divide veers to the north-northwest and follows the Lewis range, which is so wild and rugged that no wagon roads cross it for 200 mi. Opposite the Lewis range, the westerly margin of the Rockies is defined by the White Fish range (west of the north fork of Flathead river) and the Mission range (60 mi. long, southeast of Flathead lake). The latter culminates in the glacier-bearing Mt. MacDonald (9,800 ft.). Between the Mission and Lewis ranges is the Swan range (Mt. Holland, 10,400 ft.). The principal continental pass thereabouts is Marias pass (8,500 ft.), crossed by the Great Northern railroad.

The finest scenery in this quarter is within Glacier National park (see NATIONAL PARK SYSTEM, THE) with 20 peaks between 9,000 and 10,000 ft. and six between 10,000 and 10,438 ft. Mt. Cleveland is the loftiest summit. The park contains about 40 small glaciers and several large ones (from two to five square miles apiece), besides a myriad of attractive lakes.

The Canadian Rockies.—In Canada the axis of the Rockies is continuous for 1,000 mi. It is simpler, straighter and more sharply defined.

The Rockies proper, a belt averaging about 70 mi. across, are there considered as dissociated from the adjoining groups of the Purcells, Selkicks, Columbia and Pacific coast mountains. Prominent passes of the divide are: Crows Nest pass (Canadian Pacific railway), 4,450 ft.; Vermilion pass (motor road), 5,376 ft.; Kicking Horse pass (Canadian Pacific railway), 5,332 ft.; and Yellowhead pass (Canadian Pacific railway), 5,711 ft. Proceeding northwesterly from the U.S. boundary, there are no glaciers for 100 mi., the peaks being mostly below 9,000 ft. A little farther on is Mt. Joffre (11,316 ft.), the first real glacier-hung peak. From there to beyond Mt. Robson (12,972 ft., the highest of all) the system is continuously alpine for about 275 mi. Two hundred miles from the boundary the Canadian Pacific railway crosses the chain near the famous Lake Louise. Halfway between this and Mt. Joffre stands the handsome Mt. Assiniboine (11,870 ft.). In the 150-mi. gap between the Canadian Pacific and the Canadian National railways at Jasper, are situated Mt. Forbes (11,902 ft.) and Mt. Columbia (12,294 ft.), the fifth and second in rank in the Canadian Rockies respectively. In these mountains about 50 peaks surpass 11,000 ft. Glaciers and snow fields abound, and with the neighbouring groups just mentioned there is presented the best sweep of truly alpine territory to be found in America short of Alaska. The northwesterly 300 mi. of the range are imperfectly known, although the mountains are lower. (See MOUNTAINEERING.) (H. PAL.)

See W. W. Atwood, *The Rocky Mountains* (1945).

ROCKY MOUNTAIN SPOTTED FEVER AND OTHER SPOTTED FEVERS. Rocky mountain spotted fever is a typhuslike fever (see TYPHUS FEVER), first described in the Rocky mountain section of the U.S., caused by a specific species of rickettsia (*Rickettsia rickettsii*) and transmitted to man by ticks. It was found to be identical with a disease known as Sao Paulo fever in Brazil and with the spotted fever of Colombia. A closely related disease, but distinct aetiologicaly, is *fièvre boutonneuse* caused by *Rickettsia conorii*, transmitted by ticks and occurring in the countries bordering on the Mediterranean sea and scattered localities of eastern and southern Africa.

History and Distribution.—Rocky mountain spotted fever was known along the Snake river in Idaho as early as 1873 but the first clinical description of the disease in a medical journal was given by E. E. Maxey in 1899. It was characteristically a disease of the open range and was noted to occur most frequently among hunters, trappers, fishermen, cattlemen and sheepherders. Up to 1930, it was thought to be confined to 11 states of the northwest, although one case was reported in Indiana. In connection with field investigations of endemic typhus in the southeastern U.S., it was noted that cases living in rural districts in the more northern states and urban dwellers vacationing in the country suffered from a very severe disease which did not exactly correspond to the clinical picture of endemic typhus. A high proportion of these cases gave histories of tick bites within a short time preceding

the onset period. In 1931 L. F. Badger, R. E. Dyer and A. S. Rumreich recovered the causative agent from three patients who were residents of northern Virginia, and proved that it was identical with that of Rocky mountain spotted fever. After that time, the disease was shown to be widely distributed in the U.S., present in two provinces of western Canada, in two states of Brazil and in Colombia, S.A.

Epidemiology.—The selection of the disease in the western U.S. for persons exposed to the open range and the seasonal limitation to late spring and early summer months was explained when the tick vector species was identified as *Dermacentor andersoni*. This is a wood tick found widely distributed in the adult form upon the large mammals, particularly cattle and sheep, in the western range country from the eastern portion of the Pacific coast states to the western, North and South Dakota and Nevada, and from New Mexico on the south to Alberta, Saskatchewan and British Columbia on the north. Adult ticks live two to four years or more. Engorged females deposit their eggs in the soil. The winter is passed in the adult, nymphal or egg stage. Larvae, or seed ticks, emerge in the late spring and seek a blood meal on small animals. If successful, they moult to the nymphal stage, which may not become active until the following spring. Many small animals, especially rodents, are susceptible to infection with the rickettsia of Rocky mountain spotted fever and after having been bitten by an infected tick develop an inapparent form of the disease. During the period of time that the causative agent is in the peripheral circulation these animals serve as a source of infection for the uninfected larval, nymphal or adult ticks which chance to feed upon them. The rickettsiae pass through the stage-to-stage development in the tick and are carried to successive generations in decreasing numbers by transovarial passage. The infection is thus maintained in nature by the alternation of the small animal and tick hosts. Among the rodent hosts should be mentioned particularly the jack and the cottontail rabbits. The rabbit tick *Haemaphysalis leporis-palustris* is one of the principal vectors in maintaining continuous passage in small animals, although it does not attack man.

The occurrence of the human disease in the eastern and southern U.S. was explained when it was discovered that another tick species which attacks man, the common dog tick *Dermacentor variabilis*, also acts as a vector. There is some evidence to indicate that dogs may contract the infection in an inapparent form. In the southwestern U.S. human cases were also traced to the lone star tick *Amblyomma americanum*. In Brazil the common vector is *Amblyomma cajennense*. Many other tick species were found to be experimentally infectable but were epidemiologically unimportant.

Clinical and Pathological Features.—The clinical course of the disease is essentially similar to that described for typhus fever. In severe cases of spotted fever the rash tends to be more haemorrhagic and to be accentuated on the extremities, particularly about the wrists and ankles. Occasionally, a lesion may be detected at the site of the tick bite, but a typical primary eschar is lacking. Nervous and mental symptoms are common; restlessness, insomnia, disorientation and delirium are common manifestations of involvement of the central nervous system. Prostration may be extremely marked from the beginning, merging into coma with death as early as the sixth or seventh day. Convalescence is apt to be slow and may be complicated by visual disturbances, deafness and mental confusion. Although recovery may be delayed, it is usually complete in the end. The case-fatality rates, as in typhus, vary directly with age. The crude rate for reported cases in the U.S. is about 18%. The underlying pathology is essentially the same as that of typhus fever. The causative agent (*R. rickettsii*) proliferates in the endothelial cells lining the smaller blood vessels, causing damage to the vessel walls with haemorrhage, infiltration with round cells and thrombosis. Lesions are widely distributed in the tissues of the body but are characteristically frequent in the central nervous system and skin. Occasionally, there may be large areas of subcutaneous haemorrhage, particularly in the scrotum. Confirmation of the diagnosis is afforded by the Weil-Felix reaction, which becomes positive with *Bacillus proteus* X 19 and usually with X 2 and negative with *B. proteus*

X K during the second week of the illness. The complement-fixation test becomes positive about the same time. The causative agent may be recovered and identified by inoculation of guinea pigs with blood obtained from a patient early in the course of the illness. Reports at mid-20th century indicated that early institution of treatment with antibiotics—chloramphenicol (chloromycetin) and aureomycin—greatly shorten the disease and decrease the risk of death.

Prevention.—Prevention depends primarily upon exercise of personal care in protection against tick bites. Persons exposed to known infected areas should frequently examine the clothing and body for ticks. Usually the tick does not become attached to its host immediately but crawls about for several hours. It has been shown that the chance of receiving infection from the bite of a tick is directly proportional to the length of time that the tick has fed. Ticks should be removed from the person or from a pet with a small forceps or with a piece of paper. The skin area involved should be swabbed with tincture of iodine and the forceps disinfected with heat or chemicals. Hands should be washed with soap and water after such an operation. There is a satisfactory vaccination procedure against Rocky mountain spotted fever; it should be administered in the spring or early summer before the beginning of the tick season, and should be repeated each year, as the maximum degree of protection conferred is for less than a year. The degree of immunity afforded is relative, but the chance for subsequent infection is lessened and the risk of death is greatly reduced.

Fièvre Boutonneuse (Fièvre Exanthématique).—A. Connor and A. Bruch in 1920 described a mild typhuslike fever which they believed to be an endemic disease of Tunisia, North Africa, and proposed the name *boutonneuse* fever. It was subsequently observed to occur in Marseilles, Fr., and still later was discovered to have a wide geographic distribution. It was reported from most of the Mediterranean countries and the Crimea. Available evidence suggests that the diseases described as Kenya typhus and South African tick-bite fever are probably identical with *boutonneuse* fever, although conveyed by a different species of tick. One review indicated the widespread distribution of this human tick-borne rickettsiosis in Africa. Primarily, the vector was found to be a brown dog-tick, *Rhipicephalus sanguineus*; subsequently, other ticks were incriminated. The causative agent is *Rickettsia conorii*. The reservoir probably exists in nature in the lower animals, but the dog is apparently an important source of infection. The course of the disease is somewhat similar to Rocky mountain spotted fever, but it is milder. The case-fatality rate is less than 3%. A primary lesion, called by the French *tache noire* ("black spot") is frequently found. It is somewhat similar in appearance to the primary eschar characteristically seen in tsutsugamushi disease. It is, of course, located at the site of the infecting tick bite and, therefore, may be found on any part of the body, but usually on a part covered by clothing. The Weil-Felix reaction with X 29 strain of *B. proteus* becomes positive late in the disease. Experimental evidence suggests that both chloramphenicol (chloromycetin) and aureomycin would be found highly effective in the treatment of *boutonneuse* fever. Prevention depends upon protection from tick bites as outlined above.

ROCOCO, a term used to describe a phase of European art originating in France and commencing in the first quarter of the 18th century. Its name is derived from the French word *Rocailles* which was used to designate the artificial grottoes and fantastic arrangements of rocks in the gardens of Versailles; and it indicates one of the features of the rococo style in its typical form—its absolute freedom and irregularity of rhythm, the twisted curves of a shell being as it were the standard of the whole system of design. Historically, it was an extreme development of the ideas of individual imagination and love of broken curves which

characterized baroque (*q.v.*) art. For the grave and pompous dignity of the style of Louis XIV, the rococo substitutes playfulness and exquisite gracefulness and charm. Up to about the middle of the 18th century, rococo art remained gay and freakish and showed much exotic influence as, for instance, the influence of Chinese art. Then a renewal of interest in classical art and archaeology which had meanwhile taken place in Italy began to make itself felt in French art. During the later phase of the rococo, much of the playfulness disappeared, and a greater calm and balance were introduced into the style; but it retained gracefulness and charm, till eventually, between 1780 and 1790, the severe neo-classical movement superseded it. This later phase of the rococo must be regarded as a stage of transition from the rococo proper to the neo-classical art of Louis XVI. (See *LOUIS STYLES*.)

ROCROI, a town of northern France, in the department of Ardennes, 22 mi. N.N.W. of Charleville by rail, and within 2 mi. of the Belgian frontier. Pop. (1946) 751. Originally called Croix-de-Rau or Rau Croix, it was fortified in the 16th century and besieged by imperialists in 1555. Invested by the Spaniards in 1643, it was relieved by Louis II, the duke of Enghien (afterward the great Condé). Captured in 1658 by the same duke for Spain, it was not restored to France till the Treaty of the Pyrenees in 1659. In 1815 Rocroi was besieged by the Allies. As a fortified place Rocroi commands the Ardennes plateau between the valley of the Meuse and headwaters of the Oise. The fortifications, constructed by Vauban, form a pentagon and close in the town.

Battle of Rocroi.—In 1643 (see THIRTY YEARS' WAR) the Spaniards, under Francisco de Mello, invading France through the Ardennes, laid siege to Rocroi. The town lay in a small plain surrounded by woods and marshes, and could only be approached through a narrow defile. Contrary to the advice of his cautious lieutenant, Marshal de l'Hôpital, the young duc d'Enghien, later known as prince de Condé (see CONDÉ, LOUIS II DE BOURBON), though his army was inferior, decided to attack the Spaniards before the town. Either taken by surprise or deliberately courting battle, Mello omitted to block the defile and Enghien, covered by a vigorous display of cavalry under the dashing Gassion, led his army through it in safety and formed up on a low ridge facing the Spanish lines. His infantry, commanded by Espenan, was in the centre, cavalry under Gassion on the right, cavalry under la Ferté on the left, a small reserve under Siroit in rear—altogether 16,000 infantry and 7,000 cavalry, with 12 guns. The Spanish army, now concentrated on a parallel ridge facing the French, was similarly organized, 18,000 infantry in the centre under the veteran Fontaine, cavalry on the right under Isembourg, on the left under Albuquerque—27,000 men and 18 guns. Mello also expected a reinforcement of 6,000 men under Beck. Evening was approaching when la Ferté, wishing to outshine the more favoured Gassion, suddenly led his wing forward without orders, designing, perhaps, to throw a relief into Rocroi. Enghien instantly ordered him back, and Mello surprisingly allowed him to return untouched. Night fell without further action.

On May 19 the French army stood to arms at 3 A.M., Enghien, like Henry of Navarre, donning a hat adorned with white plumes instead of an armoured helmet. A deserter had reported that a battalion of musketeers was in ambush in a wood on the French right. Enghien sent a regiment of infantry to dislodge them, while cavalry, moving round behind the wood, caught them as they retired and cut them to pieces. Relieved of this danger, Enghien set himself to his main task. He himself led eight squadrons against Albuquerque's front, while Gassion with a similar force attacked his left flank. Albuquerque's force melted away before the simultaneous onslaught, and Enghien, ordering Gassion to pursue, swung his own squadrons against the left of the Spanish infantry. Meanwhile la Ferté, though ordered not to commit himself till the right attack had developed favourably, had again disobeyed. He led a ragged attack against Isembourg, was completely defeated, himself and his guns captured, while his

men fled, hotly pursued by the Spaniards. Fortunately Sirot's reserve stood firm and threw off Isembourg's attack. Espenan also had advanced against the Spanish infantry, but seeing la Ferté's disaster, drew off. At this critical moment Engghien with his cavalry struck the second line of Spanish infantry in the rear and, dispersing them, swept on to attack Isembourg's victorious cavalry. Taken completely by surprise, Isembourg's men fled, leaving their own and la Ferté's captured guns in Engghien's hands. There now remained only the front line of the Spanish infantry, the famous *tercios viejos*, standing in square upon the ridge. Beck, however, was approaching and the battle might yet be lost; collecting horse and foot Engghien led them to the attack. The Spaniards stood motionless till the French were within 50 paces; then the front face of the square opened and 18 guns belched death at the oncoming French; crashing musketry joined their roar and the attackers fell back with terrible loss. Twice Engghien renewed the attack, only to be beaten off, but the Spanish ammunition was running low, their losses were heavy, the recaptured French guns were brought into action, Sirot came up with his reserve and Gassion from his pursuit. Realizing that further resistance was hopeless, the Spanish officers signalled their desire for quarter; Engghien stepped forward to receive their surrender, but the Spanish infantry, misunderstanding his intention, opened fire upon him. Infuriated at this apparent treachery, the French hurled themselves upon the square and, overwhelming it, massacred the gallant Spaniards almost to a man. Beck, warned of his danger, retreated and the victory was complete. The price of it was 2,000 Frenchmen killed and as many wounded, but 8,000 Spaniards lay dead upon the field, and 7,000 more, nearly all wounded, were prisoners in the hands of the French. Rocroi marked the beginning of the long period of French military glory which was ended only by Marlborough and Eugene.

ROD, EDOUARD (1857-1910), French-Swiss novelist, was born at Nyon, in Switzerland, on March 31, 1857. He studied at Lausanne and Berlin, and in 1878 found his way to Paris. In 1881 he dedicated his novel, *Palmyre Veulard*, to Zola, of whom he was at this period a disciple. A series of novels of similar tendency followed. In *La Course à la mort* (1885) he turned to the analysis of moral motives. He is at his best in presenting cases of conscience, the struggle between passion and duty, and the virtues of renunciation. *Le Sens de la vie* (1889), one of his most famous books, is in the nature of a complement to *La Course à la mort*. Of his many later works, *La Vie privée de Michel Teissier* (1893), translated as *The Private Life of an Eminent Politician* (1893), is justly famous. He was an ardent student of Rousseau, and his play *Le Réformateur* (1906), is based on an episode in Rousseau's life. He died in January 1910.

RODBERTUS, KARL JOHANN (1805-1875), German socialist, was born at Griefswald on Aug. 12, 1805, where his father was professor at the university. He studied law at Göttingen and Berlin, was employed in legal offices in Prussia, and, after travelling for some time, bought the estate of Jagetzow in Pomerania (whence his name of Rodbertus-Jagetzow), and settled there in 1836. Henceforward he devoted himself chiefly to economic studies and to local and provincial affairs. In 1847 he was elected a member of the provincial diet, and in the following year he supported German unity and advocated the independence of the popular assembly. As a member of the Prussian national assembly in 1848, he was made Minister of public worship, education, and he sat for Berlin in the second chamber of 1849. He died on Dec. 8, 1875.

The general position of Rodbertus was "social, monarchical and national." He held the purely economic part of the creed of the German social-democratic party, but disagreed with their methods, and with those of the Arbeiterverein which he refused to join. While regarding the establishment of a socialist state as eventually possible, he accepted existing institutions as the result of past development and looked to the ruler of a united Germany to solve all social problems. The basis of the economic teaching of Rodbertus is the principle laid down by Adam Smith and Ricardo, and insisted on by all the later socialists, that labour is the source and measure of value. In connection with this he developed the

position that rent, profit and wages are all parts of a national income produced by the united organic labour of the workers of the community. Consequently wages of labour cannot be paid out of capital; for they are only that part of the national income which is received by the workers, of a national income which they have themselves produced.

Among his works are: *Die Forderungen der arbeitenden Klassen* (1831); *Zur Erkenntnis unserer staatswirtschaftlichen Zustände* (1842); *Gedanken des Grundbesitzes* (2nd ed., 1876). See E. C. Gonner, *Social Philosophy of Rodbertus* (1890); G. Mayer, *Rodbertus und Lassalle* (1924); H. Sultan, *Rodbertus und der agrarische Sozial Konservatismus* (1927).

RODENT, a member of the Rodentia (*q.v.*), order of gnawing mammals, more numerous than any other order and containing about 2,000 species. More widely distributed than any other group, they are found on all but the most desert oceanic islands. Most are small to medium-sized, but the pygmy mice are among the smallest of mammals, while the capybara (*q.v.*) may attain a length of 4 ft. and a weight of 100 lb. Rodents are largely terrestrial, many burrowing, many tree-living, a few gliding by skin-folds and some partly aquatic.

Rodents are noted for destroying or injuring crops and food stores, many small species eat quantities of insects and their eggs. Most rodents are eaten in primitive societies, while rabbits, hares, and squirrels (*qq.v.*) are eaten by civilized people. Beavers, chinchillas, muskrats and squirrels (*qq.v.*) produce valuable furs. Plague (*q.v.*) is transmitted by rats and ground squirrels, tularemia (*q.v.*) by rabbits. (J. E. H.).

RODENTIA, an order of placental mammals characterized by their front or incisor teeth, which are reduced to a single functional pair in each jaw, chisel-like and growing throughout life. Rodents are small or medium in size, plantigrade or partly so and generally five-toed. Canine teeth are absent; the cheek teeth, $\frac{3}{2}$ to $\frac{3}{1}$ in number, may be rooted or ever-growing and are arranged in an unbroken series. (See *ТЪРЪН*.) The orbits are not surrounded by bone except in the aberrant maned rat, *Lophiomys*.

The skull is characterized by large premaxillae, completely separating the nasals from the maxillae; by the wide space between incisors and cheek teeth and (except in the Duplicitadentata) by the anteroposteriorly elongated groove for the articulation of the lower jaw. Rodents feed chiefly on vegetable matter, but most species eat also insects and other animal matter, while a few are fishers or predators.

A wide difference of opinion exists as to the classification of this order; the scheme here followed being that of T. Tullberg (1899), with modifications.

SUBORDER SIMPLICIDENTATA

The Simplicidentata have only one pair of incisors, above and below; these have enamel only on the front surface, and in chewing the movement is obliquely backward and forward. True rodents may be divided into two sections or infraorders: the angle of the lower jaw arises from the underside of the incisor socket in the Sciuromathi; in the Hystricognathi the angle arises from the outer side. Rodents are an ancient group; and the earliest members are quite as distinct from other mammals as are the recent types, and almost as different from each other. Adaptations to similar habits occur in unrelated groups, leading to superficial similarities of structure and appearance that are frequently very detailed.

SCIUROMATHI

This section contains nine superfamilies, some of which may be more closely related than this classification indicates.

Aploodontioidea.—The skull is characterized by a small or moderate infraorbital foramen; the masseter muscle does not pass through this, nor does it extend in front of the zygomatic

FROM HAMILTON, "HISTORY OF THE UNITED STATES" (CONSTANCE PUBLISHING CO.)
HOUSE MOUSE (*MUS MUSCULUS*)

arch on the rostrum. Postorbital processes are absent or poorly marked. The tibia and fibula are free.

Family Ischyromyidae is known from the Lower Eocene to the Upper Oligocene. These rodents had marmotlike skulls and primitively cusped, rooted molars, which in later forms became crested. The dentition included 7 premolars.

Family Apodontidae has as its sole existing representative the sewellel or mountain beaver of the Pacific United States. It is about the size of a marmot, with short tail, small rounded ears and small eyes. *Apodontia* is burrowing in habit, living in damp woods. The cheek teeth are rootless and early lose the pattern; the premolars are $\frac{f}{f}$.

Family Mylagaulidae includes the strange horned rodents of the Miocene and Pliocene. In habits these animals were much like pocket gophers of the present, living in burrows on the plains. The male had a pair of horns on the nose, while the female was hornless.

Family Protoptychidae contains a few forms from the Eocene, characterized by an inflated mastoid bulla. *Eomys* of the European Upper Eocene is type of another primitive family, often referred to the Muridae or Dipodidae, from its generalized structure.

Sciuroidea.—Only the family Sciuridae can be placed here. The infraorbital foramen is small, while the masseter muscle arises in front of the zygomatic arch from the rostrum. Postorbital processes are present. The premolars are $\frac{2}{2}$. This group is a successful one, represented all over the world, except the Australian region and the oceanic islands.

Subfamily Sciurinae includes the tree and ground squirrels; it may be divided into six tribes.

Sciurini, the typical squirrels (see **SQUIRREL**) of Eurasia and America, includes numerous species. A number of genera have been allowed by authors; most of these are better considered subgenera. *Sciurus*, the typical genus, is complex and is most widespread. The European red squirrel (*S. vulgaris*) is found from Great Britain to Japan and eastern Siberia; it varies from reddish to dark gray and black in different parts of that range. The gray squirrel of the eastern United States, the Pacific gray squirrel and numerous other American species are closely related. Seven or eight subgeneric groups occur in the Neotropical region, exhibiting a great variety of colour and size. The pygmy squirrels of Central and South America, *Microsciurus*, are the smallest of the American species, hardly larger than mice, with delicate skull and narrow rostrum. *Rheithrosciurus*, the tufted-eared ground squirrel of Borneo, has many grooves on the front of the upper incisors (see **GROOVE-ROOTED SQUIRREL**). It is doubtfully referred to the typical tribe.

Tamiasciurini, the common North American red squirrels, *Tamiasciurus*, differ from all other squirrels in the reproductive system of the male; the baculum (*os penis*) is absent and the accessory glands are unique.

Funambulini includes the tree squirrels of Africa and several oriental genera. The Indian palm squirrels, *Funambulus*, are striped blackish, white and olive. *Ratufa*, the largest of the tree squirrels, includes black, red or yellowish forms; with white or yellowish undersides; they are found in India and the Malay region as far as Bali and Borneo. The African giant squirrels, *Protoxerus*, are characteristic of the tropical forest area. These squirrels are about 11 in. long, with scantily haired underparts. The red-faced giant squirrels, *Epixerus*, resemble the preceding genus but have an elongated skull. The African side-striped squirrels, *Pamisciurus*, have cheek teeth $\frac{3}{3}$, the lower molars banded. The brush squirrels, *Paraxerus*, are found in the scrub of the hill country of central Africa; most are olive-gray but several striped species are known and several mountain species are handsomely coloured. *Heliosciurus* is a common squirrel from Rhodesia to Gambia; the forms vary from gray and olive to rich reddish brown. *Myosciurus*, the African pygmy squirrel, with head and body about two and one-half inches, is restricted to the Cameroons and Gabon.

Callosciurini contains mostly oriental species. *Callosciurus*, the common oriental squirrel, is represented by several species in Burma, China, the Malay region, the Philippines and Celebes. A

great variety of coloration is exhibited in this genus; white, gray, buff, olive and reddish species or races are known, while one group, often separated as *Tamias*, is striped. *Menetes*, a long-nosed ground squirrel from Burma, Siam and the Malay peninsula, is distinguished by well-marked flank stripes. Red-cheeked ground squirrels, *Dremomys*, characterized by long-nosed skulls, are found from S. China and Burma to the Malay peninsula and Borneo. The oriental pygmy squirrels, *Nanosciurus*, occur from Malaya to the Philippines and Celebes. Striped ground squirrels, *Lariscus*, of Borneo, Java, Sumatra and the Malay peninsula, are distinguished by short tails and three dark dorsal stripes. *Rhinosciurus*, the long-nosed ground squirrel of the Malay region, including Sumatra and Borneo, is largely insectivorous. It has weak, tweezerlike incisors and extensible tongue. The Celebes long-nosed ground squirrel, *Hyosciurus*, has long front claws and normal incisors. The pygmy ground squirrel of North Borneo has broad incisors and black and white flank stripes.

Xerini, the spiny squirrels (*q.v.*) of Africa, are represented in North Africa by *Atlantoxerus*, and throughout the plains country and grasslands south of the Sahara by *Xerus*. *X. rutilus*, the typical form, occurs in Ethiopia, Somaliland and Kenya; it is yellowish-brown without stripes, the skull with convex profile. *X. (Euxerus) erythropus* of Equatorial Africa has a long narrow skull and white flank mark; its colour is reddish. *X. (Geosciurus) inauris* of South Africa is pale yellowish-brown, with a well-marked white lateral stripe.

Marmotini, containing the marmots and typical ground squirrels, is best represented in Asia and North America. The chipmunks (*q.v.*), *Tamias* and *Eutamias*, have cheek pouches, are light in build and climb well. *Eutamias* is found in eastern Asia and in western North America, while *Tamias* is restricted to eastern North America. The spermophiles, *sousliks* or ground squirrels (*q.v.*), *Citellus*, are found from Hungary through Asia and North America south to Mexico. The tail is usually short and flattened and the claws enlarged; the size varies from about five inches to more than one foot, excluding the tail. *Cynomys*, the prairie dog (*q.v.*) is confined to western North America. The tail is short and the body heavy. Marmots (*q.v.*), *Marmota*, are found in the Alps and eastward from Poland through Asia and in North America as far south as Alabama and New Mexico. Cheek pouches are absent. *Spermophilopsis*, the sand marmot of southern Siberia, may belong here. It is golden in colour, the pelage silky. The single species is a little smaller than the marmots. Cheek pouches are present and the cheek teeth are simplified in pattern.

Subfamily Petauristinae. The flying squirrels (*q.v.*) of the northern hemisphere are found from Scandinavia and northern Asia to the Malay region and throughout the forested parts of North America. The fore- and hindlimbs are connected by a broad skin fold, supported by a cartilaginous spur arising from the wrist, by means of which they glide from tree to tree. About 11 genera are recognized. *Petaurista*, the giant flying squirrel of southern Asia, occurs from India and Japan to Java and Palawan; the various forms are red or black, sometimes spotted with white. The woolly flying squirrel, *Eupetaurus* of the Himalayan region, is about the same size (head and body about 24 in.; tail 18 in.); its cheek teeth are high-crowned, unlike those of other Sciuridae. *Sciuropterus*, a smaller type, is found in northern Europe and Asia, east to Japan. Closely related species, usually recognized as generically distinct (*Glaucomys*), are found in North America as far south as Honduras. In the Malay region a number of other genera occur, varying in size from that of a mouse to that of a rat; they are distinguished by dental and cranial characters.

Castoroidae.—Two families are included here, one of which is extinct. The masseter muscle is similar in its attachment to that in the Sciuridae, but postorbital processes are absent; the cheek teeth are complicated in pattern and rootless in Recent forms, although originally four-cusped and rooted.

Family Castoridae is represented by two living species of beaver (*q.v.*), although formerly it was a large and varied group. Fossil forms carry the beavers back to the Middle Oligocene but, except for differences in tooth pattern, the earlier forms are much like the later ones. Subfamily Castoroidinae includes giant forms

almost as large as a bear, with cheek teeth of a different pattern. These were characteristic of the Pleistocene of North America and Europe. Older types were smaller, the earliest appearing in the Lower Miocene.

Family Eutypomyidae includes a few Middle Oligocene castorids, with two upper premolars. The cheek teeth have numerous small enamel islands.

Geomyoidea.—Two families of American rodents are referred to this superfamily. They combine characters of the squirrel, beaver and mouse groups; the masseter muscle and structure of the infraorbital canal agree with that of the squirrels. Postorbital processes are absent and all have external fur-lined cheek pouches.

Family Geomyidae. The pocket gophers (*g.v.*) are stout-bodied, burrowing rodents with small eyes and ears and large front claws. The skull is massive and flat. The fossil subfamily, Entoptychinae of the Oligocene and Miocene, had rooted teeth but otherwise resembled Recent gophers. The Geomyinae contains forms with simple, ever-growing cheek teeth.

Family Heteromyidae includes three subfamilies. The pocket mice (*g.v.*), Perognathinae, are known from Oligocene times on. The cheek teeth are rooted, the cusps of the lower premolars form a quadrate pattern, those of the other teeth form cross-crests. The kangaroo rats (*g.v.*), Dipodominae, have rootless teeth without pattern when worn; the enamel is restricted to bands. The spiny pocket rats, Heteromyiinae, have rootless teeth, which when worn form a C-pattern, narrow anteroposteriorly. *Heteromys*, the typical genus, occurs in Central America and northern South America, also in Trinidad.

Anomaluroidea.—Part of the masseter muscle passes through the infraorbital canal, while the lateral masseter is restricted to the zygomatic arch, differing in these respects from other rodents except the Dipodoidea and Hystriicoidea.

Family Anomaluridae includes arboreal rodents without post-orbital processes, cheek teeth $\frac{3}{2}$, and large auditory bullae. On the underside of the tail is a series of imbricated scales. A skin membrane extends between fore- and hindlimbs, supported by a cartilaginous spur from the elbow, except in *Zenkerella*. *Anomalurus* includes various species which are confined to Equatorial Africa as far south as Northern Rhodesia. The subfamily Idiurinae contains two genera: *Idiurus*, with a flying membrane, and *Zenkerella*, which is without this membrane. These are found in the West African forest area.

Family Pseudosciuridae may belong here; it agrees in the attachment of the masseter. The cheek teeth are cusped or crested, with low crowns, while the skull is long and flattened. The several genera are found in the Eocene and Oligocene of Europe.

Family Theridomyidae is also extinct, known only from the Middle Eocene to the Oligocene of Europe. The earliest forms had teeth somewhat squirrellike in pattern, while in later types the pattern was reduced to enamel islands.

Family Pedetidae. *Pedetes*, the jumping-hare (*g.v.*) of eastern and southern Africa, is a kangaroo-like rodent about the size of a fox, buffy brown in colour with white hip stripe. *Parapedetes*, a similar form, occurs in the Miocene of Africa.

Ctenodactylidae.—The African family Ctenodactylidae includes three genera. Part of the masseter muscle passes through the infraorbital foramen, which is large. The mandible lacks a coronoid process, the teeth are prismatic and the auditory and mastoid bullae are inflated. *Ctenodactylus*, the gundi of North Africa (Morocco to Tripoli) is about the size of a squirrel, with short tail and pale buffy coloration. *Massoutiera* is the long-tailed gundi of the Sahara desert and Senegal. *Pectinator* of Somaliland and Eritrea has a long bushy tail and $\frac{3}{2}$ cheek teeth, more than in any rodent except certain Bathyergidae. *Pectinator* is known from the Miocene of India, while other representatives of the family are reported from the Pliocene of the Mediterranean region.

Gliroidea.—This subfamily includes the dormice and their relatives. They resemble squirrels in habit and general appearance. The tail is bipennate or bushy. The cheek teeth are usually $\frac{3}{2}$ but may be $\frac{3}{1}$, with transverse crests. The lower leg bones are fused. The caecum is absent in most species.

Family Gliiridae, the true dormice. The typical genus, *Glis*, includes the large edible dormouse (*g.v.*) found from France and Spain to Asia Minor. *Muscardinus*, the common dormouse, ranges from England to the Mediterranean and near east; it is much smaller than *Glis*, about as long as a house mouse but with heavier body. Several other types occur in Europe and Asia. The African dormice are often given subfamily rank (Graphiurinae), differing from the typical group in having a more primitive attachment of the lateral masseter muscle, and the teeth have only poorly marked cross-crests. *Graphiurus*, a large gray dormouse, is restricted to South Africa. *Claviglis* is smaller, with more rounded skull; it contains a number of species in various parts of Africa south of the Sahara. Subfamily Platycanthomyiinae is characterized by cheek teeth $\frac{3}{2}$ in number; the crowns wear flat. The pelage is mixed with flat spines, while the tail is tufted. *Platycanthomys* is found in India and is arboreal. *Typhlomys* of China is apparently fossorial, with reduced eyes; it has a small caecum. Subfamily Selevalinae contains only the Recent *Selevalina*, described in 1938 from central Asia. It differs from typical dormice in its mouse-like tail, vestigial basin-crowned molar teeth and large incisive foramina.

Dipodoidea.—The jerboas and jumping mice (*g.v.*) are included here. Cranially, they have a large infraorbital canal through which the medial masseter muscle passes, as in the Anomaluridae and Ctenodactylidae. The cheek teeth are typically $\frac{3}{2}$, the first upper one small.

Family Zapodidae. These mouse-like rodents differ from the true mice chiefly in the characters of the superfamily. Subfamily Sicistinae, found in Europe and Asia, includes only *Sicista*, the birch mouse. This yellowish-brown rodent is marked by a single black dorsal stripe; it climbs readily, living in birch forest and feeds on seeds. The North American jumping mice (*g.v.*), subfamily Zapodinae, are long-tailed, long-legged rodents, found also in China.

Family Dipodidae includes jumping rodents resembling kangaroo rats but with even longer feet. The three middle metatarsal bones are usually fused into a cannon bone. Cheek teeth are $\frac{3}{2}$. The lateral toes are reduced or lost. The bullae are large and the mastoid inflated. *Euchoreutes* of central Asia is type of a subfamily; it is characterized by ungrooved incisor teeth, cheek teeth $\frac{3}{2}$, the zygomatic arch slanting gradually upward to the lachrymal, and enormous ears. *Cardiacranius* and *Salpingotus* of Mongolia and central Asia form a third subfamily characterized by unfused metatarsal bones and less angular zygomatic arch than in the Dipodinae.

Muroidea.—The mice and their allies are characterized by the slitlike infraorbital foramen, through which the medial masseter muscle passes and which is compressed by the development of the zygomatic plate, the flattened area from which part of the lateral masseter arises. The cheek teeth are $\frac{3}{2}$. The cardiac part of the stomach is lined by a cornified layer; the colon forms a spiral loop.

Family Cricetidae is characterized by the upper molars, the cusps of which are arranged in two rows. This pattern is frequently obscured, the cusps wearing down to form zigzag crests. Cricetids, only slightly different from modern types, are known from the Oligocene of America and Asia. Subfamily Cricetinae includes the native American muroids with the exception of the Holarctic voles and their allies. *Cricetus* and several related hamsters (*g.v.*) are found in Europe and Asia; they are heavy-bodied, short-tailed burrowing rodents. *Oryzomys*, found from Patagonia to New Jersey, is represented by numerous species, one group of which extends to the Galapagos Islands. The American harvest mice, *Reithrodontomys*, vary from small to large mice characterized by grooved incisors, while the white-footed or deer mice, *Peromyscus*, with internal cheek pouches, are the dominant North American forms from Alaska to Panamá. *Onychomys*, the grasshopper mouse, resembles the old world hamsters in appearance but lives chiefly on insects and other mice. *Neotoma*, the pack rat, is quite ratlike in appearance but its teeth are more like the Microtinae in their zigzag pattern. A great variety of tropical American genera are known.

Subfamily Myosopladinae includes a gopherlike genus from Siberia and northern China. The cheek teeth are ever-growing and prismatic,

nbiling the Microtinae. Subfamily Nesomyinae includes a few rats from Madagascar. *Nesomys* has teeth much like *Oryzomys* *ogomys*, a burrowing form, has prismatic teeth suggestive of *Oryzomys*, as has also *Macrotarsomys*. *Eliurus* differs from *Oryzomys* in having cross-crested teeth.

Spilomys, the maned rat of eastern Africa, is given subfamily or family rank because of its odd skull; the temporal fossa is completely rooted over by bone, the surface of which is granulated; the ears, however, are cricetid. The tail is bushy. The feet are specialized an arboreal life, with a partly opposable hallux.

Subfamily Microtinae includes the voles and lemmings (*qq.v.*) and in the northern hemisphere south to Guatemala and Burma cheek teeth are high-crowned and prismatic, forming a complex up pattern. The skull is angular, marked with muscule ridges. As in voles, the lemmings (*Lemmus* and allies, have a specialized for burrowing. *Ondatra*, the muskrat (*qq.v.*), is the largest in the group, with a long dorso-ventrally flattened tail and partly webbed hind feet. This is connected with the following forms by intermediates like *Arvicola*, the Eurasian water vole, and *Neofiber*, round-tailed muskrat of Florida. *Microtus*, the voles or meadow voles, are usually small. The lemmings (*Lemmus* and allies, have enlarged cheek teeth with short lower incisor (the root ending in the jaw opposite the molars); they are chiefly arctic and northern Asia. A few genera have rooted cheek teeth: *Ellobius* and *Nesomys*, the subterranean voles of southern and central Asia; *Arvicola*, the red-backed bank vole of northern Europe, Asia, and America; *Phenacomys*, including the red tree mouse and other American voles. *Brachylamomys* of Madagascar shows many similarities to the voles but it has probably developed independently from the primitive Cricetidae, probably the Nesomyinae.

Subfamily Gerbillinae contains a number of jumping rodents, with a brain case, inflated mastoid and auditory bullae and prismatic cheek teeth, the transverse crests developed from paired cusps both above and below. The upper incisors are grooved in all but a few cases. Gerbils (*qq.v.*) are widespread in Africa and southern Asia. A typical genus *Gerbillus* occurs in both regions. The mastoids not highly inflated, nor prominently bulging when the skull is inflated from above. *Tateras* is found throughout the range of the subfamily; it is more ratlike. *Ammodillus*, a dwarf form from Somalia, lacks a coronoid on the mandible. *Pachyromys* of North Africa, extremely inflated bullae and mastoids and a short clublike tail which fat is stored, while *Desmodillus* is a fat-tailed gerbil from the deserts of South Africa. *Meriones*, found in Africa and Asia, molars which are laminated throughout life and rootless. *Psammomys* has high-crowned but rooted molars; it is found in North Africa and Palestine.

Subfamily Spalacidae contains several burrowing rodents of the old world, resembling the American pocket gophers in general appearance but with cheek teeth of different pattern, and the zygomatic structures are derived from a primitive muroid type. *Spalax*, blind mole rat of southern Europe, Egypt and western Asia, is a subfamily by itself. Rhizomyinae contains the bamboo rats, *Myomys*, of India, China and the Malay region, large rodents with silky gray fur and short tail. The east African mole rats, *Myomys*, are smaller, about eight inches head and body length, soft reddish-brown fur.

Subfamily Muridae is an old world group, although some species have been introduced to almost all parts of the globe. The upper molars are three rows of cusps, which often unite to form cross-crests. Subfamily Murinae contain the typical rats and mice, with a few rat forms. About 400 species are recognized. *Mus*, the house mouse and closely allied species, is almost world-wide. *Rattus*, among the well-known black and brown rats and many other species native to Asia and Africa, is especially varied in the Austro-Malayan area; several species have been carried all over the world on ships even on primitive native boats. The bandicoot-rats (*qq.v.*), *Bandicota* and *Bandicota*, are burrowers, found from Egypt to China in the Malay region. African giant rat, *Cricetomys*, measure 30 in. total length, the tail long with a white tip. The spiny mice, *Echinosorex*, are widely distributed in east Africa, southwestern Asia, and Creta; these are almost as spiny as hedgehogs. The rats of Africa, *Arvicanthus* and its relatives, are volelike but webbed, have with stripes. Genera of various relationships have been arboreal, often becoming quite similar in appearance. Several v. rats (*Mycteromys*, *Echinosorex* and *Melomys*), with long club-shaped heads and heavy-bodied appearance, as found in Java, Sumatra and Celebes. The Philippine shrew rat (*Rhynchomys*) has cheek teeth and short white incisors; it may feed on insects and worms. Two bushy-tailed rats (*Platacomys* and *Ceratomys*) are in the northern Philippines. The Australian native mice and form a varied group, some rabbitlike, others with saltatorial or aquatic adaptations. Several giant rats occur in Celebes, New Guinea and the Solomons, heavily-bodied and as large as the African species. Subfamily Hydromyinae contains the water rats of Australia and Guinea and several genera in the Philippines. Most species have two molars, characterized by banded crowns, and the infraorbital foramen is wide. Large feet and the otterlike pelage fit their life in the water. Subfamily Dendromurinae contains the African mice, characterized by reduced number of cusps on the molars.

The tree mice (*Dendromys*) have opposable first toes, often with nails; the yellowish brown upper parts often have a single black stripe. The West African bush mouse (*Prionomys*) is pale chocolate in colour. Spiny tree rats (*Deomys*) from West Africa and the Congo, are remarkable for their long tails. The fat mice (*Sitomys*), widely distributed in Africa, are hamsters with short-tailed members, while *Sitomys* of the savannas is coloured a handsome pale gray and possesses internal cheek pouches. The mouse gerbils of South-West Africa (*Malacothrix*) also belong here. Subfamily Otomyinae contains several African swamp rats, resembling large voles but with laminated teeth and long soft fur.

HYSTRICOGNATHI

These rodents are characterized by the angle of the lower jaw, arising from the side of the root of the incisor. Except in the Bathyergidae, the medial masseter muscle passes through the infraorbital foramen, which is large.

Bathyergoidea.—This superfamily includes only the burrowing

Bathyergoidea is a superfamily of rodents, characterized by the angle of the lower jaw, arising from the side of the root of the incisor. Except in the Bathyergidae, the medial masseter muscle passes through the infraorbital foramen, which is large.

Hystricoidea.—This superfamily includes only the burrowing rodents, characterized by the angle of the lower jaw, arising from the side of the root of the incisor. Except in the Bathyergidae, the medial masseter muscle passes through the infraorbital foramen, which is large.

Wonders are included here, although some doubt exists as to their relationships. Quite possibly most of their similarities may be convergence. Both families have a covering of quills and the teeth are complex, wearing flat at an early age. Family Hystricidae includes the old world porcupines. They are ground-living rodents and their long quills are firmly attached to the skin. *Hystrix* contains the larger forms, two feet or more in length, with short tails and inflated skulls, and is found in southern Europe, Africa and southern Asia. *Thecurus* is smaller, with a flattened skull profile and nasals ending opposite the infraorbital canal; it is restricted to Borneo, Sumatra and Palawan, in the Philippines. *Atherurus* is widespread in Africa and Asia, extending south to Sumatra. It is smaller, like a large rat, with a tail about half the length of the body, ending in a brush of hollow quills, each of which resembles a string of flat beads. The long-tailed porcupine (*Trichys*) has short spines and the skull has postorbital processes.

Family Erethizontidae contains the American tree porcupines, characterized by less complex patterns on the cheek teeth, short paracymbial processes on the skull. The hind feet are modified for an arboreal life, the first toe being replaced in function by a movable pad. *Erethizon*, the North American porcupine, is a large, heavily-bodied rodent, the quills of the body nearly hidden by long hairs. *Coendou*, from South and Central America, is smaller and has a long prehensile tail. *Echinoprocta*, found in Colombia, has a short tail, only a little longer than the foot and not prehensile, but it resembles *Coendou* cranially. *Chaetomys* deserves subfamily rank; its teeth are more simple, the skull has well-developed postorbital processes and the spiny covering is restricted to the head and forelimbs. The tail is long and scaly.

Cavioidae.—The mandible differs from that in the Hystricoidea in that the angle is not distorted laterally. The coronoid is small and a deep groove indicates the insertion of the deep masseter.

Family Caviidae includes the guinea pigs, cavies and capybara (*qq.v.*). The cheek teeth are ever-growing and prismatic. The clavicles are absent, the lateral toes of the hind foot are lost and the tail is much reduced. Subfamily Caviinae is characterized by two- or three-lobed teeth. *Cavia* is represented by a number of South American species related to the well-known guinea pig and rather similar to it. *Kerodon rupestris* of Brazil is characterized by blunt teeth on the toes. *Dolichotis*, containing two distinct species, is restricted to Argentina; it is rabbitlike in appearance and habits, especially *D. patagonica*, the mara.

Several rodent families described from the Santa Cruz Miocene of South America are related to the Caviidae and others are referable to this family.

Subfamily Hydrochoerinae, *Hydrochoerus*, the aquatic capybara, with complicated postorbital molars, is found from Panamá to Paraguay. It is the largest existing rodent, with a body length of four feet and heavy build. Fossil rodents closely allied to the capybara are known from the Pleistocene of both South and North America.

Family Dinomyidae includes only one living species, with mandible more like that of the Hystricoidea. The tail is longer than the broad feet. The skull is broad and porcupine-like; the molars consist of four transverse plates. The family is known from the Miocene of South America and the West Indies.

Family Heptaxodontiidae contains a number of extinct forms of the Pliocene, among them rodents even larger than the capybara.

Family Dasypodidae includes the pacas and agoutis (*qq.v.*) of tropical America. The agoutis, subfamily Dasypodinae, are the size of rabbits, with short tail and three toes on the hind foot. The

pacas, subfamily Cuniculinae, have an enormous cheek plate developed from the zygomatic arch. The teeth are lobate, the crows wearing flat and the lobes becoming enamel lates. The hind foot has five toes.

Chinchilloidea.—The cheek teeth are ever-growing, consisting of two or three transverse plates. The skull has large bullae and inflated mastoid. The angle of the mandible is narrow and produced posteriorly, while the coronoid is minute. The fibula is small. The lateral toes of the hind foot are vestigial or lost. Only the family Chinchillidae is included here; it has been distinct since the Oligocene and is unknown outside of South America, the plains of Argentina and the Andes from Ecuador south. *Chinchilla lanigera* and *C. brevicauda* are soft-furred rodents, about the size of a large squirrel (see CHINCHILLA). Almost equally soft-furred are the rabbit-eared species of *Lagidium*, found from Peru and Chile to southern Argentina.

The larger viscachas (*Lagostomus*) of the Argentine pampas are the size of a hare (head and body 20 in., tail 8 in.), with large head and robust body. They live in colonies like prairie dogs but are nocturnal. The viscachas (*L.*) are gray, with blackish and white facial markings and a white stripe on the hind leg.

Ocotodontidae.—The zygomatic structure resembles that in the Hystricidae. The cheek teeth usually have an E-pattern, the branches of which may become islands on wear; in some forms there are four branches instead of three.

Family Capromyidae includes two groups. The hutias (*Capromys*) of the Greater Antilles and the weasels (*Reithrodontomys*) of the rodents, with ever-growing cheek teeth of the E-pattern. The coypu (*q.v.*) or nutria rat (*Myocastor*) is a large beaverlike rodent found from Brazil and Argentina to Chile.

Family Octodontidae contains a number of rodents, chiefly Chilean or Argentine in distribution, with simplified kidney-shaped or bilobed cheek teeth. Subfamily Ctenomyiinae includes the fossorial two tuco (*Ctenomys*), which resemble burrowing rodents of other groups. The cheek teeth are kidney-shaped. Subfamily Octodontinae contains rat-like or mouse-like forms with tufted tails, chiefly found in the southern Andes. *Spalacopus* and *Acomys* of this group are fossorial types, resembling *Ctenomys* but with cheek teeth of the figure-eight pattern.

Family Abrocomidae includes only a single Recent genus *Abrocoma*, characterized by tail and appearance of short hairy tail and inflated bullae. The cheek teeth are ever-growing, prismatic, the upper ones like a distorted figure eight, the lower ones somewhat E-shaped, with a single re-entrant angle on the cheek side. The incisive foramina are large.

Family Echimyidae contains many rodents of ratlike appearance, with pelage coarse or spiny and rooted cheek teeth. These have a distorted E-pattern, both above and below, with the lower ones to produce transverse enamel islands. Subfamily Echimyinae includes genera with narrow cheek teeth. Subfamily Dactylomyiinae is characterized by broad upper cheek teeth with four lateral lobes and by soft fur. The third and fourth digits of the feet are usually elongated.

Family Thryonomyidae is represented by the cane rats of Africa, *Thryonomys*. The incisors are broad and powerful, the upper ones three-toothed. The cheek teeth show a modified E-pattern.

Family Petromyidae. The rock rat of South-West Africa (*Petromys*) resembles a large, bushy-tailed rat. The cheek teeth have a distorted eight-pattern.

SUBORDER DUPLICIDENTATA

Two pairs of upper incisors are present, the second pair small and situated behind the first; the enamel extends completely around the incisors. This group is often considered a distinct order, the Lagomorphs.

Family Ochotonidae includes the pikas or mouse hares; these have no external tail, the ears are short and the hind legs not modified for leaping. Pikas (*q.v.*) are widely distributed from southeastern Europe through Asia to western North America.

Family Leporidae contains the hares and rabbits (*q.v.*); the hind limbs are elongated, the tail short and recurved and the ears are long. The cheek teeth number 8. *Lepus*, the hare genus, occurs throughout the northern hemisphere and in Africa, represented by numerous species. *Caprolagus* of Assam and adjacent areas has harsh pelage, a brown tail and ears shorter than the head. *Neolagus* of Sumatra is striped with black, while the rump is mahogany brown. *Pentalagus*, found in the Liu Kiu Islands, has only five upper cheek teeth; it has a black dorsal stripe. *Romerolagus*, which occurs in high mountains of southern Mexico, is tailless and is otherwise primitive. The cottontails (*q.v.*) of North and South America, *Sylvilagus*, have short ears but dig little. The red hares of South Africa (*Pronolagus*) are heavily built types with brown or red tails. The true rabbit, *Oryctolagus*, originally distributed over North Africa and southern Europe, is distinguished from *Lepus* by its short ears and limbs, its digging habits and the young, which are born blind and helpless.

RODEO, a series of contests in cowboy sports which sprang from the early cattle industry of the western part of the United States. In the early days of the industry vast areas of unfenced grazing lands with only imaginary boundary lines separated the domains of the various cattlemen, and it was natural for their herds to mingle one with another. It became the custom for several cattlemen of a section or territory to throw all their cowboys into one big crew for the semiannual rounding up of the cattle and the separation of each owner's stock.

In the course of such roundups much bantering and argument and wagering developed as to which ranch had the best riders or fastest ropers, and at the close of these roundups there was often held a riding and roping contest to settle such wagers and to determine who was the best rider or roper.

The first public cowboy contest wherein prizes were awarded to the winners of bronco riding and steer roping was held on an open flat adjoining the courthouse at Pecos, Texas, on July 4, 1883, but no admission fee was charged the spectators.

The first contest held wherein prizes were awarded to the winners of the contests, and an admission fee charged to spectators, was held in Prescott, Arizona (Territory), on July 4, 1888, and was so successful that other cattle-raising centers began holding such annual contests, which were called "Cowboy Tournaments," "Stampedes," "Roundups" or "Frontier Days." The word *rodeo* (which is of Spanish origin) was applied to such contests in the United States for the first time in 1916.

The first indoor rodeo was held in the Stockyards coliseum in Fort Worth, Texas, in 1917, and after that there were many rodeos held in various large buildings or coliseums in many parts of the country. This lengthened the rodeo season, for such contests could be held during the winter months, whereas outdoor rodeos were held only from spring until fall.

Rodeo contests were confined to the western and middle-western parts of the United States and Canada until 1916, when the first big cowboy contest in the eastern part of the United States was staged at Sheepshead Bay Speedway, Brooklyn, N.Y., and was called the "New York Stampede."

In 1926, indoor rodeos were started in old Madison Square Garden in New York city and were called the "World Series Rodeo"; in 1929, with the completion of the new Madison Square Garden, the rodeos were held in the new Garden and the title changed to "World's Championship Rodeo."

The events of outdoor rodeos differ from those of indoor rodeos, the larger arena space of outdoor rodeos permitting such

A COWBOY THROWING A STEER AT A WESTERN RODEO

contests as range relay races, chuckwagon races, wild horse races and steer roping, in addition to what is termed the five major events of rodeo: saddle bronco riding, calf roping, bareback bronco riding, bulldogging or steer wrestling and wild steer or bull riding.

Calf roping was added to the rodeo contests soon after the start of indoor rodeos, to take the place of steer roping, which the limited space of the indoor arenas would not permit.

All bucking or riding events are judged by a point system, the judges scoring points in accordance with the masterfulness of the ride, combined with the roughness or bucking prowess of the ani-

Rodney (2 vols., 1830); David Hannay, *Life of Rodney*; Rodney letters in 9th Report of Hist. mss. Com., pt. II.; "Memoirs," in *Naval Chronicle*, I, 333-393; and Charnock, *Biographia Navalis*, v, 204-228. Lord Rodney published in his lifetime (probably 1789) *Letters to His Majesty's Ministers, etc., relative to St. Eustatius, etc.*, of which there is a copy in the British Museum. Most of these letters are printed in Mundy's *Life*, vol. II., though with many variant readings.

RODÓ, JOSÉ ENRIQUE (1872-1917), Uruguayan philosopher, author and politician, was born in Montevideo on July 15, 1872. He was educated in a free lay school and at the University of Montevideo, where he showed extraordinary aptitude for history, literature and philosophy. In 1895 he was one of the founders of the *National Review of Literature and Social Sciences*, in which, in the following year he published an essay on literary criticism, "El que vendrá," which brought him immediate recognition as a writer and critic. In 1898 he was made professor of literature in the university, and two years later was appointed director of the National library, but in 1901 he gave up both positions to enter congress, to which he was elected in 1902 and 1908 and where he took an earnest part in initiating social legislation; he was not, however, a radical, and in a pamphlet, *Liberalismo y Jacobinismo* (1907), he strenuously opposed government anti-church legislation. In 1910 he represented Uruguay at the centenary of Chilean independence. Rodó's influence, however, as a rallying point of Latin-American youth was due to his authority as exponent of optimism, as stylist and as advocate of unity in Spanish-American literature and culture. His first important philosophical work, *Ariel*, based on Renan's eclecticism, appeared in 1900 in defence of Latin-American culture against the utilitarianism of the United States. In 1909 he published *Motivos de Proteo*, an assertion of the inevitability of change and the possibility of self-improvement, which represents Rodó's highest attainment as thinker and master of the Spanish language, and caused him to be hailed by Spanish-Americans as their philosopher *par excellence*. His essays on Rubén Darío (1899), Bolívar and Montalvo won him a similarly unique place in Spanish-American letters, to which, in those on Bolívar and Montalvo, included in *El Mirador de Próspero* (1913), he gave models of historical and critical essays. He died at Palermo in May 1917.

Urcía, "José Enrique Rodó," *Cuba Contemporánea* (Aug., 1918); Andrés González-Blanco, *Escritores representativos de América* (Madrid, 1917); V. G. Calderón, *Señalinas de América* (Madrid, 1919); L. Goldberg, *Students in Spanish-American Literature* (New York, 1920). (W. B. F.)

RODOSTO or **TERKIDAĞ**, a town of European Turkey, in the vilayet of Tekirdağ, on the Sea of Marmora, 78 mi. west of Istanbul. Pop., vilayet (1950) 222,916; town 15,680. The Bay of Rodosto is enclosed by the great promontory of Combos, a spur about 2,000 ft. in height from the hilly plateau to the north. The church of Panagia Rheumatocraissa contains the graves, with long Latin inscriptions, of the Hungarians who were banished from their country in 1686 by the imperial captors of Buda. Rodosto was long a great depot for the produce of the Edirne district, but its trade suffered when Dédağsch became the terminus of the railway up the Maritza, and the town became dependent on its maritime trade, especially its exports to Istanbul. It is the administrative centre of a district (*sanzak*) producing and exporting barley, oats, spelt and canary seed, and largely planted with mulberry trees, on which silkworms are fed. White cocoons are ordinarily exported to western Europe, silkworms' eggs to the U.S.S.R. and Iran.

Rodosto is the ancient *Rhodesius* or *Bisanthe*, said to have been founded by Samians. From 1920 to 1922 it was in Greek territory but was restored to Turkey by the Treaty of Lausanne.

RODRIGUEZ (officially **RODRIGUES**), an island in the Indian ocean in 19° 41' S., 63° 23' E.; a dependency of the British colony of Mauritius, from which it is 350 mi. distant. With a length from east to west of 94 mi., it is approximately 4 mi. broad. The area is 42 sq. mi. The population at the census of 1944 was 11,885. It is surrounded by a fringing reef of coral, studded with islets. This reef, 100 yd. wide on the east, extends 3 mi. west, and both north and south forms a flat area partly dry at low water.

Two passages through the reef are available for large vessels—these passages leading respectively to Port Mathurin on the north coast and to Port South-East.

The island is a mass of volcanic rock, mainly a doleritic lava, rich in olivine. The land is hilly and the main ridge rises abruptly on the east, but more gradually on the west, where there is a wide plain of coral limestone, studded with caves. Of several peaks on the main ridge the highest is Mt. Limon (1,290 ft.). The ridge is deeply cut by ravines, the upper parts of which show successive belts of lava separated by thin beds of ashes, conglomerate and ochre-coloured clays. In places the cliffs rise 300 ft. and exhibit 12 distinct lava flows. The climate is like that of Mauritius, but Rodriguez is the north-west monsoon (November to April).

Flora and Fauna.—When discovered, Rodriguez was clothed with fine timber trees; but goats, cattle and bush-fires have combined to destroy the greater bulk, and the indigenous plants have in many cases been ousted by intrusive foreigners. Parts are still well wooded, and elsewhere there is excellent pasturage. The sweet potato, manioc, maize, millet, the sugar-cane, cotton, coffee, rice and tobacco are cultivated. Wheat is seldom seen, but beans (*Phaseolus lunatus*), lentils, gram (*Cicer arietinum*), dholl (*Cajanus indicus*) and ground-nuts are all grown. Mangoes, bananas, guavas, pineapples, custard-apples, and especially oranges, citrons and limes flourish.

At present the only indigenous mammal is a species of fruit-eating bat (*Pteropus rodericensis*), and the introduced species are familiar creatures as deer, pig, rabbit, rat, mouse, etc., but until recently there occurred a very large land-tortoise (*Testudo vosmaeri*), and its limestone caves have yielded a large number of skeletons of the now extinct bird, the solitary (*Pezophaps solitaria*). Of indigenous birds 13 species have been registered. The guinea-fowl (introduced) has become exceedingly abundant, partly owing to a protective game-law; and a francolin (*Francolinus ponticrius*), is also common. The marine fish-fauna does not differ from that of Mauritius, and the fresh-water species, with the exception of *Mugil rodericensis* and *Myxus caecilius*, are common to all the Mascarenes. The insects comprise at least 60 species of Coleoptera, 15 Hymenoptera, 21 Lepidoptera, 15 Orthoptera, and 20 Hemiptera. Forty-nine species of coral have been collected, showing a close affinity to those of Mauritius, Madagascar and the Seychelles.

History.—Rodriguez or Diego Ruy's island was discovered by the Portuguese in 1645. In 1690 Duquesne prevailed on the Dutch Government to send a body of French Huguenots to the Island of Bourbon, at that time, he believed, abandoned by the French authorities. The refugees, however, found the French in possession and therefore proceeded to Rodriguez where eight of their number were landed on April 30, 1691, with a promise that they should be visited by their compatriots within two years. The two years were spent without misadventure but, instead of waiting for the arrival of their friends, the colonists left the island on May 8, 1693, and made their way to Mauritius, where they were treated with great cruelty by the governor. From the Dutch the island passed to the French, who colonized it from Mauritius. Large estates were cultivated, and the islanders enjoyed considerable prosperity. In 1809-10 Rodriguez was seized by the British, in whose possession it has since remained. The abolition of slavery proved disastrous to the prosperity of the island, and in 1843 the population had sunk to about 250. Since that time there has been a gradual recovery in the economic condition and a steady increase in population. The inhabitants are mainly of African origin, being descendants of slaves introduced by the French, and negro immigrants direct from Africa. There are a few families of European descent (besides the comparatively large staff maintained by Cable and Wireless, Limited) and a small colony of Indians and Chinese. The bulk of the people are French-speaking and Roman Catholics. There are two small settlements, Port Mathurin, the capital, and Gabriel, in the centre of the island. The island is administered by a magistrate appointed by the governor of Mauritius, and the laws are regulations issued by the governor in executive council.

See F. Leguat, *Voyages et aventures* (1708), ed. by Capt. P. Oliver, in vol. lxxxi and lxxxii of the Hakluyt society publications (1891). See also C. Grant, *Hist. of Mauritius and the Neighbouring Islands* (1801); Higgin, in *Journ. R.G. Soc.* (1849); the *Reports of the Transit of Venus Expedition*, 1874-75, published as an extra volume of the *Philosophical Transactions*, clxviii (Botany), by I. B. Balfour; Petrology, by N. S. Maskelyne, etc 1879; Behm, in *Petermann's Mittheilungen* (1880); A. J. Bertucci, *The Island of Rodriguez* (1923); and the annual reports and works on Mauritius.

RODZIANKO, MIKHAIL VLADIMIROVITCH (1859-1923), Russian politician, was born in 1859, of a family of great landowners. In 1906 and 1907 he was a member of the council of the empire for the zemstvo of the province of Ekaterinoslav. He was a member of the third and fourth dumas. He joined the right wing of the Octobrist (moderate Liberal party) and with the support of the conservatives was elected president of the third дума. As president of the fourth дума he took part in the struggle for constitutional changes in the government opposing the reactionary policy of the government and defending the rights of the дума. During World War I he took an important part in the unifying of the Russian industries. As president of the provisional committee of the state дума, at the moment of the revolution, he sent a telegram to the tsar, pointing out the necessity of his abdication. After the revolution he took part in the civil war as one of the managers of the Russian Red Cross and was forced to emigrate to Yugoslavia, where he died Jan. 24, 1923.

ROE, SIR ALLIOTT VERDON (1877-), British aeronautic engineer and inventor of the Avro biplane. He made his first flight on June 8, 1908, and in 1909 flew in an aeroplane with an engine of only 9-10 h.p. He was knighted in 1929.

ROE, HUMPHREY VERDON (1878-1949), British aeronautic engineer, was born on April 18, 1878. He served in the South African War and joined the royal air force during World Wars I and II. In 1918 he married Marie Carmichael Stopes and with her founded at Holloway the first birth control clinic (1921). He died in London, July 25, 1949.

ROE (or Row), SIR THOMAS (c. 1581-1644), English diplomatist, born at Low Leyton, Essex, was educated at Magdalen college, Oxford. He was made esquire of the body to Queen Elizabeth I, was knighted in 1605 and in 1610 was sent by Henry, prince of Wales, to the West Indies and South America to discover gold. Elected M.P. for Tamworth (1614) and Cirencester (1621), his reputation was secured by his successful mission to the court of the great Mogul, Jahangir, at Agra, where he obtained protection for an English factory at Surat. Appointed ambassador to the Porte in 1621, Roe secured further privileges for English merchants, concluded a treaty with Algiers in 1624 and gained the support of the Transylvanian prince Bethlen Gabor for the European Protestant alliance and the cause of the Palatinate.

Through his friendship with the patriarch of the Greek Church the Codex Alexandrinus was presented to James I, and Roe himself collected several valuable manuscripts, which he gave to the Bodleian library. In 1629 he mediated successfully between the kings of Sweden and Poland; in 1630 he negotiated treaties with Danzig and Denmark, and in 1637 was appointed chancellor of the Order of the Garter. Subsequently he took part in the peace conferences at Hamburg, Regensburg and Vienna; in June 1640 he was made a privy councillor, and in October he became member of parliament for the University of Oxford. He died on Nov. 6, 1644.

His *Journal of the mission to the Mogul*, several times printed, was re-edited, with an introduction by W. Foster, for the Hakluyt society (1899). Of his correspondence, *Negotiations in his Embassy to the Ottoman Porte, 1621-28*, vol. i, was published in 1940, but the work was not continued. Other correspondence, consisting of letters relating to his mission to Gustavus Adolphus, was edited by S. R. Gardiner for the Camden Society Miscellany (1875), vol. vii, and his correspondence with Lord Carew in 1615 and 1617 by Sir F. Maclean for the same society in 1860. Several of his manuscripts are in the British museum collections. Roe published a *True and Faithful Relation . . . concerning the Death of Sultan Osman . . . 1622*; a translation from Sarpi, *Discourse upon the Revolution Taken in the Vallette* (1628); and in 1613 T. Wright published *Quatuor Colloquia*, consisting of theological disputations between himself and Roe; a poem by Roe is printed in *Notes and Queries*, iv, series v, 9. *The Swedish*

Intelligencer (1632-33), including an account of the career of Gustavus Adolphus and of the diet of Ratisbon (Regensburg) is attributed to Roe in the catalogue of the British museum. Several of his speeches, chiefly on currency and financial questions, were also published. Two other works in manuscript are mentioned by Wood: *Compendious Relation of the Proceedings . . . of the Imperial Diet at Ratisbon* and *Journal of Several Proceedings of the Order of the Garter*.

ROEBLING, JOHN AUGUSTUS (1806-1869), U.S. civil engineer, was born at Mülhausen, Prussia, on June 12, 1806. Soon after his graduation from the polytechnic school at Berlin he moved to the United States, and in 1831 entered on the practice of his profession in western Pennsylvania. He established near Pittsburgh a wire rope factory, and in May 1845 completed his first important structure, a suspended aqueduct across the Allegheny river. This was followed by the Monongahela suspension bridge at Pittsburgh and several suspended aqueducts on the Delaware and Hudson canal. Removing his wire factory to Trenton, N.J., he began in 1851 the erection at Niagara falls of a long-span wire suspension bridge with double roadway, for railway and vehicular use (see BRIDGES), which was completed in 1855. Because of the novelty of its design, the most eminent engineers regarded this bridge as foredoomed to failure; but, with its complete success, demonstrated by long use, the number of suspension bridges rapidly multiplied, the use of wire ropes instead of chain cables becoming all but universal. The completion, in 1867, of the still more remarkable suspension bridge over the Ohio river at Cincinnati, O., with a clear span of 1,057 ft., added to Roebelling's reputation, and his design for the great bridge spanning the East river between Manhattan and Brooklyn, New York city, was accepted. While personally engaged in laying out the towers for the bridge, Roebelling received an accidental injury, which resulted in his death, at Brooklyn, from tetanus, on July 22, 1869. The bridge was completed under the direction of his son, Washington Augustus Roebelling (1837-1926).

ROEBOURNE, a settlement of the Northwest division of Western Australia, 8 mi. from the northwest coast, about lat. 20° 40' S., long. 117° E., 920 mi. directly N. of Perth. It is a centre of the West Pilbara Goldfield district. It has an unusually hot climate with a low and very variable rainfall. There are extensive pearl fisheries off its port at Cossack bay.

ROEBUCK, JOHN (1718-1794), English inventor, was born in 1718 at Sheffield; after attending the grammar school there and Doddridge's academy at Northampton, he studied medicine at Edinburgh, where he was imbued with a taste for chemistry by W. Cullen and J. Black, and he finally graduated M.D. at London in 1741. He started an apothecary at Birmingham, but devoted himself to the study of chemistry. There he introduced various improvements in the methods of production, including the conversion (patented in 1762) of cast iron into malleable iron "by the action of a hollow pit-coal fire" urged by a powerful artificial blast. He became interested in James Watt's engine, and in return for a two-thirds share in the invention assisted in perfecting its details, but financial troubles caused him to part with his share to Matthew Boulton in return for the cancellation of a debt of £1,200. He died July 27, 1794.

ROEBUCK, JOHN ARTHUR (1801-1879), British politician, was born at Madras on Dec. 28, 1801, and brought up in Canada. He was called to the English bar in 1824, and became M.P. for Bath in 1832. In 1838 he appeared at the bar of the commons to protest, in the name of the Canadian assembly, against the suspension of the Canadian constitution. In 1855, having overthrown Lord Aberdeen's ministry by carrying a resolution for the appointment of a committee of inquiry into the mismanagement in the Crimean War, he presided over the proceedings of the committee. For nearly 30 years he was M.P. for Sheffield. He died on Nov. 30, 1879, in London.

ROEBUCK, the smallest European deer (a full-grown buck standing 27 in. at the shoulder), the typical representative of a genus (*Capreolus*) in which the antlers lack a brow-tine and belong to the forked type, while the tail is rudimentary (see DEER). The antlers are short, upright, and deeply furrowed, the beam forking at about two-thirds of its length and the upper prong again dividing, thus making three points. The coat in summer is foxy red above and white below; in winter this changes to a grayish fawn, with a white rump-patch. The roebuck or roedeer (*C. capreolus*) inhabits southern and temperate Europe and Asia, represented by various races in Sweden, Scotland, Armenia, Spain and parts of Asia. They frequent woods, preferring those that have underwood and are in the neighbourhood of cultivated ground where they visit in the evening in search of food. Before pairing, the bucks pursue the does round specially trodden circular or octagonal runs. Pairing takes place in August, but the fawns are not born till the following May. Roe were formerly abundant in all the wooded parts of Great Britain, but are now restricted to the Highlands of Scotland and a few localities farther south. They take readily to water. The Siberian roe (*C. c. pygargus*), common in the Altai, is larger and pelier, with shorter and more hairy ears and small irregular snags on the inner border of the antlers. The Manchurian roe (*C. c. bedfordi*) is about the size of the European species, with antlers of the type of those of the Siberian roe, but more slender.

ROEDERER, PIERRE LOUIS, COMTE (1754-1835), French politician and economist, was born at Metz on Feb. 15, 1754, the son of a magistrate. He became councillor at the parliament of Metz, and was commissioned in 1787 to draw up a list of remonstrances. His work advocating the suppression of internal customs houses (*Suppression des douanes intérieures*, 1787) is a treatise on the laws of commerce and on the theory of customs imposts. In the Constituent assembly he was a member of the committee of taxes, prepared a new system of taxation, drew up a law on patents, occupied himself with the laws relating to stamps and assignments, and successfully opposed the introduction of an income tax. After the close of the Constituent assembly he was elected, on Nov. 11, 1791, *procureur général syndic* of the department of Paris. When he saw the perilous drift of things, he had tried to get into touch with the king; and it was on his advice that Louis, on the fatal roth, took refuge in the assembly. Roederer was in hiding until after Robespierre's fall. Under the empire, Roederer, whose public influence was considerable, was Joseph Bonaparte's minister of finance at Naples (1806), administrator of the grand duchy of Berg (1810), and imperial commissary in the south of France. During the Hundred Days he was created a peer of France. The Restoration government stripped him of his offices and dignities, but he recovered the title of peer of France in 1832.

Roederer died on Dec. 17, 1835.

His writings include: *Louis XII* (1820); *François I* (1825); *Comédies historiques* (1827-30); *L'Esprit de la révolution de 1789* (1831); *La Première et la deuxième année du consulat de Bonaparte* (1803); *Chronique des cinquante jours* (1832); *Mémoire pour servir à l'histoire de la société poète en France* (1835). See his *Oeuvres*, edited by his son (1853 seq.); *Sainte-Beuve, Causeries du lundi*, vol. viii; M. Mignet, *Notices historiques* (1851).

ROEMER, FRIEDRICH ADOLPH (1809-1869), German geologist, was born at Hildesheim, in Prussia, on April 14, 1809. In 1845 he became professor of mineralogy and geology at Clausthal, and in 1862 director of the School of Mines. He first described the Cretaceous and Jurassic strata of Germany in *Die Versteinerungen des Norddeutschen Oolithengebirges* (1836-39), *Die Versteinerungen des Norddeutschen Kreidegebirges* (1840-41) and *Die Versteinerungen des Harzgebirges* (1843). He died at Clausthal on Nov. 25, 1869.

His brother, CARL FERDINAND VON ROEMER (1818-1891), educated for the legal profession at Göttingen, also became interested in geology, and abandoning law in 1840, studied science at the University of Berlin. Two years later he published his first work, *Das Rheinische Übergangsgebirge* (1844), in which he dealt with the older rocks and fossils. In 1845 he visited the U.S., the results of his work being published in *Texas* (1849), and *Die*

Kreidebildungen von Texas und ihre organischen Einschüsse (1852). From 1847 to 1855 *privatdozent* at Bonn, he was then appointed professor of geology, palaeontology and mineralogy in the University of Breslau, a post which he held until his death on Dec. 14, 1891.

He prepared, with H. G. Bronn, the third edition of *Lethæa geognostica*, and later published one section, *Lethæa palæozoica*, of an enlarged and revised edition. In 1862 he superintended the preparation of a geological map of upper Silesia, and the results of his researches were embodied in his *Geologie von Oberschlesien*.

ROEMER, OLE (Latinized OLAUS) (1644-1710), Danish astronomer, was born at Aarhus, Jutland, on Sept. 25, 1644. He became in 1662 the pupil and amanuensis of Erasmus Bartholinus at Copenhagen. In 1671 he assisted J. Picard to determine the position of Tycho Brahe's observatory (Uraniborg, on the island of Hveen). In 1672 he went to Paris with Picard, and spent nine years on observations at the new royal observatory and hydraulic works at Versailles and Marly. After a scientific mission to England (1679), on which he met Newton, Halley and Flamsteed, he returned to Copenhagen in 1681 as royal mathematician and professor of astronomy in the university. He also held several public offices, including that of mayor (1705). He died at Copenhagen on Sept. 23, 1710.

Roemer is remembered as the discoverer of the finite velocity of light, which was suggested to him by his observations on the eclipses of Jupiter's moons. The first noteworthy transit instrument was in 1690 erected at his house. He also set up at the university observatory an instrument with altitude and azimuth circles, and an equatorial telescope. He also built and equipped the "Tusculan" observatory at Vridsløsemagle, near Copenhagen. His observations perished in the great fire of Oct. 21, 1728, except those discussed by J. G. Galle in *O. Roemeri triduum observationum astronomicarum a 1700 institutarum* (Berlin, 1845).

ВЪВЕДЕНІЕ.—E. Phillips, *Nordisk Universitets Tidsskrift*, v, 11 (1860); F. Horrebow, *Basis Astronomiæ* (Copenhagen, 1735); J. B. J. Delambre, *Hist. de l'astr. moderne*, ii, 621; J. F. ROERICH, NIKOLAI KONSTANTINOVICH (1874-1947), Russian painter of Scandinavian origin, established his reputation with pictures of Russian prehistoric life and the wanderings of Vikings. After beginning with realistic pictures, his manner evolved under the influence of the Byzantine icon and of oriental art, toward a purely decorative and monumental style. He studied the technique of ancient Russian frescoes and his wall paintings for the Kazan railway station at Moscow, representing combats between Russians and Tatars, are his most important work. He executed a number of works for the theatre: for the Russian ballet he painted the scenery in *Prince Igor*; for Stanislavsky the setting of *Pyotr Glyn*. He wrote the libretto for, and designed the scenery and the costumes of, *The Rite of Spring*, for which Igor Stravinsky composed the music. After the Russian revolution of 1917 he settled successively in the U.S. and in India. More than 1,000 of his works are in the Roerich museum, New York, established in 1923, and in other famous galleries. He died Dec. 13, 1947, in Kulu, East Punjab.

ROERMOND, a town in the province of Limburg, the Netherlands, on the right bank of the Maas at the confluence of the Roer, and a junction station 28 mi. by rail N.N.E. of Maastricht. Pop. (1947) 21,428. The old fortifications were dismantled and partly converted into fine promenades. A bridge across the Roer, dating from 1771, connected Roermond with the suburb of St. Jacob. Roermond was made the seat of a Roman Catholic episcopal see. The Romanesque minster church dates from the first quarter of the 13th century. In the middle of the nave is the tomb of Gerhard III, count of Gelderland, and his wife Margaret of Brabant. It was formerly the church of a Cistercian nunnery, and in modern times was elaborately restored. The cathedral of St. Christopher is also of note; on top of the tower (246 ft.) a copper statue of the saint was erected. The interior was adorned with paint-

ings by Rubens, Jacob de Wit (1695-1754) and others. The old bishop's palace became the courthouse, and the old Jesuits' monastery a higher-burgher school. Woollen, cotton, silk and mixed stuffs, paper, flour and beer are manufactured there. Roermond suffered damage during World War II.

ROGATION DAYS, in the Calendar of the Christian Church, the three days before Ascension Day. Their observance, by fasting and chanting litanies in procession, was introduced by St. Mamertus, bishop of Vienne (d. c. 475), and was ordered throughout France by the first Council of Orleans in 511. Leo III. (pope 795-816) introduced rogation days, but without fasting, at Rome. The custom had spread earlier into the English Church, where it was confirmed in 747 by the Council of Clovesho. After the Reformation the processions gradually ceased to be ecclesiastical in England, and now survive only in the perambulation of the parish boundaries on or about Ascension Day.

See also PROCESSION and LITANY.

ROGER (d. 1181), archbishop of York, known as Roger of Pont l'Évêque, was a member of the household of Theobald, archbishop of Canterbury, where he quarrelled violently with another future archbishop, Thomas Becket. In 1148 he was appointed archdeacon of Canterbury, and soon afterwards chaplain to King Stephen, who sent him on an errand to Rome in 1152; then in Oct. 1154 he was consecrated archbishop of York in Westminster abbey. When Henry II. entered upon his struggle with Becket he secured the support of Roger, and having been appointed papal legate in England, the archbishop visited Pope Alexander III. and the French king, Louis VII., in his master's interests. In June 1170 he crowned the king's son Henry, in spite of prohibitions from the pope and from Becket, and for this act he was suspended. He quarrelled with Richard, the new archbishop of Canterbury, about the respective rights of the two archiepiscopal sees, until 1176, when the king arranged a truce; and he was constantly endeavouring to assert his supremacy over the Scottish church. He died at York on Nov. 21, 1181.

ROGER (d. 1139), king of Salisbury, was originally priest of a small chapel near Can. The future King Henry I., who happened to hear mass there one day, was impressed by the speed with which Roger read the service, and enrolled him in his own service. Roger, though uneducated, showed great talent for business, and Henry, on coming to the throne, almost immediately made him chancellor (1101). Soon after Roger received the bishopric of Salisbury. In the Investiture controversy he skillfully managed to keep the favour of both the king and Anselm. Roger devoted himself to administrative business, and remodelled it completely. He created the exchequer system, which was managed by him and his family for more than a century, and he used his position to heap up power and riches. He became the first man in England after the king, and was in office, if not in title, justiciar. He ruled England, while Henry was in Normandy, and succeeded in obtaining the see of Canterbury for his nominee, William of Corbeil. Duke Robert seems to have been put into his custody after Tinchebrai. Though Roger had sworn allegiance to Matilda, he disliked the Angevin connection, and went over to Stephen, carrying with him the royal treasure and administrative system (1135). Stephen placed great reliance on him, on his nephews, both bishops and on his son Roger, who was treasurer.

Roger himself had built at Devizes a splendid castle. He and his nephews seem to have secured a number of castles outside their own dioceses, and the old bishop behaved as if he were an equal of the king. At a council held in June 1139, Stephen found a pretext for demanding a surrender of their castles, and on their refusal they were arrested. After a short struggle all Roger's great castles were sequestered. This quarrel with the church, which immediately preceded the landing of the empress, had a serious effect on Stephen's fortunes. Roger died at Salisbury in December 1139. He was a great bureaucrat, and a builder whose taste was in advance of his age. But his contemporaries were probably justified in regarding him as worldly, ambitious, avaricious, unfettered by any high standard of personal morality.

See Sir J. Ramsay's *Foundations of England*, vol. II., and J. H. Round's *Geoffrey de Mandeville*.

ROGER I. (1031-1101), ruler of Sicily, was the youngest son of Tancred of Hauteville. Arriving in Southern Italy soon after 1057, he shared with Robert Guiscard the conquest of Calabria, and in a treaty of 1062 the brothers apparently made a kind of "condominium" by which each was to have half of every castle and town in Calabria. Robert now commissioned Roger to reduce Sicily, which contained, besides the Muslims, numerous Greek Christians subject to Arab princes who had become all but independent of the sultan of Tunis. In May 1061 the brothers crossed from Reggio and captured Messina. After Palermo had been taken in January 1072 Robert Guiscard, as suzerain, invested Roger as count of Sicily, but retained Palermo, half of Messina, and the north-east portion of the island. Not till 1085, however, was Roger able to undertake a systematic crusade. In March 1086 Syracuse surrendered, and when in February 1091 Noto yielded the conquest was complete. Much of Robert's success had been due to Roger's support. Similarly the latter supported Duke Roger, his nephew, against Bohemund and other rebels, in return for which the duke surrendered to his uncle in 1085 his share in the castles of Calabria, and in 1091 the half of Palermo.

At the enfeoffments of 1072 and 1092 no great undivided fiefs were created, and the mixed Norman, French and Italian vassals owed their benefices to the count. No feudal revolt of importance therefore troubled Roger. Politically supreme, the count became master of the insular Church. While he gave full toleration to the Greek Churches, he created new Latin bishoprics at Syracuse and Girgenti and elsewhere, nominating the bishops personally, while he turned the archbishopric of Palermo into a Catholic see. The Papacy granted to him and his heirs in 1098 the Apostolic Legation in the island. Roger was tolerant towards Arabs and Greeks, allowing to each race the expansion of its own civilization. In the cities the Muslims, who had generally secured such terms of surrender, retained their mosques, their kadis, and freedom of trade; in the country, however, they became serfs. He drew from the Muslims the mass of his infantry, but the Latin element began to prevail with the Lombards and other Italians who flocked into the island in the wake of the conquest, and the conquest of Sicily was decisive in the steady decline of Mohammedan power in the western Mediterranean. Roger, the "Great Count of Sicily," died on June 22, 1101, and was buried in S. Trinità di Mileto. His third wife, Adelaide, niece of Boniface, lord of Savona, gave him two sons, Simon and Roger, of whom the latter succeeded him.

See E. Caspar, *Roger II. und die Gründung der normannisch-sicilischen Monarchie* (Innsbruck, 1904). (E. CV.)

ROGER II. (1093-1154), king of Sicily, son of the preceding, began to rule as count in 1112, and from the first aimed at uniting the whole of the Norman conquests in Italy. In 1127, Roger claimed the Hauteville possessions, and the overlordship of Capua, for which Richard II. in 1098 had sworn homage to Duke Roger, in virtue of a promise made by William, the late duke of Apulia. The union of Sicily and Apulia, however, was resisted by the subjects of the duchy itself, and by the pope at Capua (Dec. 1127) who preached a crusade against the claimant, setting against him Robert II. of Capua and Ranulf of Alife, or Avellino, brother-in-law of Roger. The coalition, however, failed, and in August 1128 Honorius invested Roger at Benevento as duke of Apulia. The baronial resistance, backed by Naples, Bari, Salerno and other cities, whose aim was civic freedom, also gave way, and at Melfi (Sept. 1129) Roger was recognized as duke by Naples, Capua and the rest. He at once began to enforce order in the Hauteville possessions, where the ducal power had long been falling to pieces. For the binding together of his states the royal name seemed essential, and the death of Honorius in February 1130, followed by a double election, seemed the decisive moment. While Innocent II. fled to France, Roger supported Anacletus II. The price was a crown, and on Sept. 27, 1130, a bull of Anacletus made Roger king of Sicily. He was crowned in Palermo on Dec. 25, 1130.

This plunged Roger into a ten years' war. Bernard of Clairvaux, Innocent's champion, built up against Anacletus and his

"half heathen king," a coalition joined by Louis VI. of France, Henry I. of England and the emperor Lothar. Meanwhile the forces of revolt in South Italy drew to a head again, and on June 24, 1132, the king was defeated at Nocera by Ranulf. Nevertheless, by July 1134, he forced Ranulf, Sergius, duke of Naples, and the rebels to submit, while Robert was expelled from Capua. Meanwhile Lothar's contemplated attack upon Roger had gained the backing of Pisa, Genoa and the Greek emperor, all of whom feared the growth of a powerful Norman kingdom. In February 1137 Lothar moved south and was joined by Ranulf and the rebels; in June he besieged and took Bari. At San Severino, after a victorious campaign, he and the pope jointly invested Ranulf as duke of Apulia (Aug. 1137), and the emperor then retired to Germany. Roger, freed from the utmost danger, recovered ground, sacked Capua and forced Sergius to acknowledge him as overlord of Naples. At Rignano the indomitable Ranulf again utterly defeated the king, but died in April 1139, leaving none to oppose Roger, who subdued the rebels pitilessly.

The death of Anacleto (Jan. 25, 1138) determined Roger to seek the confirmation of his title from Innocent. The latter, invading the kingdom with a large army, was skillfully ambushed at Galuccio on the Garigliano (July 22, 1139), and on July 25 the pope invested him as "Rex Siciliæ ducatus Apuliæ et principatus Capuæ."

Roger, now become one of the greatest kings in Europe, made Sicily the leading maritime power in the Mediterranean. A powerful fleet was built up under several "admirals," or "emirs," of whom the greatest was George of Antioch, formerly in the service of the Muslim prince of El Mehdiya. Mainly by him a series of conquests were made on the African coast (1135-53) which reached from Tripoli to Cape Bona. The second crusade (1147-48) gave Roger an opportunity to revive Robert Guiscard's designs on the Greek Empire. George was sent to Corinth at the end of 1147 and despatched an army inland which plundered Thebes. In June 1149 the admiral appeared before Constantinople and defied the Basileus by firing arrows against the palace windows. The attack on the empire had, however, no abiding results. The king died at Palermo on Feb. 26, 1154, and was succeeded by his fourth son William.

Personally Roger was of tall and powerful build, with long fair hair and full beard. With little of Robert Guiscard's personal valour, he yet showed to the full his uncle's audacity, diplomatic skill and determination. It is Roger II.'s distinction to have united all the Norman conquests into one kingdom and to have subjected them to a government scientific, personal and centralized. The principles of this are found in the Assizes of the kingdom of Sicily, promulgated at Ariano in 1140, which enforced an almost absolute royal power. At Palermo Roger drew round him distinguished men of various races, such as the famous Arab geographer Idrisi and the historian Nilus Doxopatrius. He maintained a complete toleration for the several creeds, races and languages of his realm; he was served by men of the most diverse nationalities.

Contemporary authors are: Falco of Benevento, Alexander of Teles, Romuald of Salerno and Hugo Falcandus, all in the *Scriptori cronisti napoletani*, ed. Del Re, vol. I. See also E. Caspar, *Roger II. und die Gründung der normannisch-sicilischen Monarchie* (Innsbruck, 1904) (E. C. v. X.).

ROGER OF HOVEDEN or **HOWDEN** (fl. 1174-1202), English chronicler, was, to judge from his name and the internal evidence of his work, a native of Howden in the East Riding of Yorkshire. But nothing is known of him before the year 1174. He was then in attendance upon Henry II., by whom he was sent from France on a secret mission to the lords of Galloway. In 1175 he again appears as a negotiator between the king and a number of English religious houses. In 1180, he was a justice of the forests in the shires of Yorkshire, Cumberland and Northumberland. About the year 1192 he began to compile his *Chronica*, a general history of England from 732 to his own time. Up to the year 1192 his narrative adds little to our knowledge. From that time, however, Howden is an independent and copious authority. Both on foreign affairs and on questions of domestic policy he is unusually well informed. He is particularly useful

on points of constitutional history. His work breaks off abruptly in 1201. Probably his death should be placed in that year.

See W. Stubbs's edition of the *Chronica* (Rolls Series) and the introductions to vols. I. and IV. This edition supercedes that of Sir H. Savile in his *Scriptores post Bedam* (1599).

ROGER OF WENDOVER (d. 1236), English chronicler, was probably a native of Wendover in Buckinghamshire. At some uncertain date he became a monk of St. Albans; afterwards he was appointed prior of the cell of Belvoir, but he forfeited this dignity in the early years of Henry III., having been found guilty of wasting the endowments. His later years were passed at St. Albans, where he died on May 6, 1236. He is the first of the important chroniclers who worked in the scriptorium of this house. His great work, the *Flores Historiarum*, begins at the creation and extends to 1235. It is of original value from 1202. Some critics have supposed, but on inconclusive evidence, that Wendover copied, up to 1189, an earlier compilation, the work of John de Cella, the twenty-first abbot of St. Albans (1195-1214).

A 13th-century manuscript is in the Bodleian library (Douce mss. 207), a mutilated 14th-century copy in the British Museum (Cotton mss. Otho B. v.). Matthew Paris prepared an edition which forms the first part of that writer's *Chronica Majora* (ed. H. R. Luard, Rolls Series, 7 vols.). The best edition of Wendover is that of H. O. Coxe (4 vols., 1847-52); there is another (from 1154) in the Rolls Series by H. G. Hewlett (3 vols., 1886-89). See Luard's prefaces to vols. I, II, III, and VII of the *Chronica Majora*; and the *Monumenta Germaniae Historica*, *Scriptores*, Band xxviii, pp. 3-20.

ROGERS, HENRY DARWIN (1808-1866), American geologist, was born at Philadelphia on Aug. 7, 1808. At the age of 21 he was chosen professor of chemistry and natural philosophy at Dickinson college, Pennsylvania. After holding this post for three years, he went to Europe and took up the study of geology. Subsequently he was engaged for 22 years in the State surveys of Pennsylvania and New Jersey, his reports on which were published during the years 1836-41. In 1842 he and his brother WILLIAM BARTON ROGERS (1805-82), who had been similarly occupied in Virginia, brought before the Association of American Geologists and Naturalists their conclusions on the physical structure of the Appalachian chains, and on the elevation of great mountain chains. The researches of H. D. Rogers were elaborated in his final *Report on Pennsylvania* (1858), in which he included a general account of the geology of the United States and of the coal-fields of North America and Great Britain. In 1857 he was appointed professor of natural history and geology at Glasgow. One of his later essays (1861) was on the parallel roads of Lochaber (Glen Roy), the origin of which he attributed to a vast inundation. He died at Glasgow on May 29, 1866.

ROGERS, JAMES EDWIN THOROLD (1823-1890), English economist, was born at West Meon, Hampshire, in 1823, and educated at King's college, London, and Magdalen Hall, Oxford. After taking a first-class degree in 1846, he was ordained and was for a few years a curate in Oxford. Subsequently he resigned his orders. He was a classical scholar and published in 1865 an edition of Aristotle's *Ethics*; but his friendship with Richard Cobden (q.v.) led him to study economics, with the result that in 1859 he became professor of statistics and economic science at King's college, London, a post which he filled till his death. From 1862 he was also Drummond professor of political economy at Oxford. During that period he published (in 1866) the first two volumes of his *History of Agriculture and Prices in England*, dealing with the period 1250-1400, a mastery record upon which his reputation mainly rests. Two more volumes (1401-1582) were published in 1882, a fifth and sixth (1583-1702) in 1887, and he left at his death copious materials for a seventh and eighth. An acquaintance with Cobden and John Bright (q.v.) led Rogers to take an active part in politics; he represented Southwark in parliament from 1880 to 1885, and Bermondsey in 1885-86, as an advanced Liberal. In 1888, on the death of Prof. Bonamy Price, who had succeeded him at Oxford as professor of political economy, he was re-elected to the post. Previously (in 1883) he had been appointed lecturer in political economy at Worcester college, Oxford. His later years were mainly spent at Oxford, where he died on Oct. 12, 1890. Thorold Rogers did

much to promote the historical study of economics to which he made a solid contribution in his *Six Centuries of Work and Wages* (1885).

His most important publications are:—*Manual of Political Economy* (1868); an edition of Adam Smith's *Wealth of Nations* (1869); *Cobbett and Public Opinion* (1873); *The Speeches of J. Bright* (edited) (1868); and *The First Nine Years of the Bank of England* (1887).

See also W. J. Ashley, in *The Political Science Quarterly* (1889); and E. Castelot, in *Nouveau Dictionnaire d'Economie Politique*, supplement.

ROGERS, JOHN (c. 1500–1555), English Protestant martyr, born at Aston, near Birmingham, was educated at Pembroke Hall, Cambridge, where he graduated B.A. in 1526. Six years later he was rector of Holy Trinity, Queenhithe, London, and in 1534 went to Antwerp as chaplain to the English merchants. Here he met William Tyndale, under whose influence he abandoned the Roman Catholic faith, and married an Antwerp lady. After Tyndale's death Rogers pushed on with his predecessor's English version of the Old Testament, which he used as far as 2 Chronicles, employing Coverdale's translation (1535) for the remainder and for the Apocrypha. Tyndale's New Testament had been published in 1526. The complete Bible was put out under the pseudonym of Thomas Matthew in 1537; it was printed in Antwerp, and Richard Grafton published the sheets and got leave to sell the edition (1,500 copies) in England. Rogers had little to do with the translation, but he contributed some valuable prefaces and marginal notes. His work was largely used by those who prepared the Great Bible (1539–40), out of which in turn came the Bishop's Bible (1568) and the Authorized Version of 1611. After taking charge of a Protestant congregation in Wittenberg for some years, Rogers returned to England in 1548, where he published a translation of Melancthon's *Consideratione of the Augsburg Interim*. In 1550 he was presented to the crown livings of St. Margaret Moyses and St. Sepulchre in London, and in 1551 was made a prebendary of St. Paul's, where the dean and chapter soon appointed him divinity lecturer.

On the accession of Mary, Rogers preached at Paul's Cross commending the "true doctrine taught in King Edward's days," and warning his hearers against "pestilent Popery, idolatry and superstition." Ten days after (16th August 1553), he was summoned before the council and bidden to keep within his own house. In January 1554 Bonner, the new bishop of London, sent him to Newgate, where he lay with John Hooper, Laurence Saunders, John Bradford and others for a year. On January 22, 1555, Rogers with ten others came before the council at Gardiner's house in Southwark, and held his own in the examination that took place. On the 28th and 29th he came before the commission appointed by Cardinal Pole, and was sentenced to death by Gardiner for heretically denying the Christian character of the Church of Rome and the real presence in the sacrament. He met his death on the 4th of February 1555 at Smithfield. He was the first Protestant martyr of Mary's reign, and his friend Bradford wrote that "he broke the ice valiantly."

ROGERS, JOHN (1627–1665?), English preacher, a Fifth Monarchy man, second son of Nehemiah Rogers, a royalist and Anglican clergyman, was born at Messing, Essex; he studied medicine at King's college, Cambridge. In the quarrel between the army and the parliament Rogers sided with the army, and he was one of the first to join the Fifth Monarchy movement. He approved of the expulsion of the Long Parliament, but the establishment of the Protectorate at once threw the Fifth Monarchy men into antagonism. Rogers addressed a warning letter to Cromwell, and attacked him from the pulpit on Jan. 9, 1654. His house was searched and his papers seized, and Rogers then issued another denunciation against Cromwell, *Mene, Tekel, Perez: a Letter lamenting over Oliver Lord Cromwell*. On March 28, on which day he had proclaimed a fast for the sins of the rulers, he preached a violent sermon against the protector. He was arrested in July. He confronted Cromwell with great courage when brought before him on Feb. 5, 1655, and was imprisoned successively at Windsor and in the Isle of Wight; being released in Jan. 1657. He returned

to London, and, being suspected of conspiracy, was again imprisoned by Cromwell in the Tower (Feb. 3–April 16, 1657). On the protector's death and the downfall of Richard Cromwell the ideals of the Fifth Monarchy men seemed nearer realization but Rogers was engaged in political controversy with Prynne, a became a source of embarrassment to his own faction, which he deavoured to get rid of him by appointing him "to preach the gospel" in Ireland. On the outbreak of Sir George Booth's royal insurrection, however, he became chaplain in Charles Fairfax's regiment, and served throughout the campaign. He was imprisoned in Dublin in Jan. 1660 by order of the army faction as released subsequently by the parliament. At the Restoration he withdrew to Holland, studied medicine at Leyden and Utrecht where he obtained his M.D. in 1662. He was admitted to the degree of M.D. at Oxford in 1664, and is supposed to have died soon afterwards.

Besides the above pamphlet, Rogers wrote in 1653 *Ohel or Bet, shemesh, a Tabernacle for the Sun*, in which he attacked the Presbyterians; *Sagor, or Doomsday drawing nigh*, from his new standpoint as a Fifth Monarchy man, *Challah, the Heavenly Nymph* (1653); *Do or Chailan; the Beloved or the Bridegroom going forth for his Bride* (1653); *Prison-born Morning Beams* (1654); *Four Saindants* . . . (1657); *Mr. Prynne's Good Old Cause stated and stunted to Yeago* . . . (1609); *Διακρίσεις a Christian Concertation* (1659); *M Harrington's Parallel Unparalleled* (1659); *A Vindication of Sir I Vane* (1659); *Disputatio Medica Incurabilis* (1662).

AUTHORITIES.—Ed. Rogers, *Life and Opinions of a Fifth Monarch Man* (1867), compiled from Rogers's own works; Wood, *Athenæ Oxonienses and Fasti; Calendars of State Papers* (Domestic). See also "English Ancestry of Washington," *Harper's Magazine*, xxi. (1895) "John Rogers of Puleigh," *The Nation*, vol. 53 (1891).

ROGERS, JOHN (1829–1904), American sculptor, was born at Salem, Mass., on Oct. 30, 1829. He wanted to become sculptor, and spent eight months in study at Rome and Paris in 1858–59. Becoming discouraged, he returned to America and obtained employment as a draughtsman in the office of the city surveyor of Chicago; but soon afterwards, owing to the favourable reception of his group of small figures, "The Checker Players" he resumed sculptural work, confining himself to these small figures, known as "Rogers Groups," which had an enormous popular success and were extensively reproduced. In 1863 he became a National Academician. He died at New Haven, Conn., on July 27, 1904.

ROGERS, ROBERT (1731–1795), American frontier soldier, was born at Methuen, Mass., and in 1739 removed to Starktown (now Dunbarton), N.H. During the Seven Years War he raised and commanded a force of militia, known as Rogers's Rangers, which won wide reputation for its courage and endurance in the campaigns about Lake George. He took part in Wolfe's expedition against Quebec and in the Montreal campaign of 1760. Afterwards he was sent by Gen. Amherst to take possession of the north-western posts, including Detroit. He was again in the West in 1763 during the Pontiac uprising, accompanying Dallyell's expedition and participating in the battle of Bloody Bridge. Soon after he went to England and in 1767 published in London a *Concise Account of North America* at his *Journals* of service in the Seven Years' War. In 1766 he published *Ponteach: A Tragedy*, one of the first American dramas, supposedly also written by Rogers. He further laboured the king a memorial proposing to lead an overland expedition from the Mississippi river to the Pacific ocean. This was refused him but instead he was given command of the north-west post of Michilimackinac. From here in 1766 he sent off on his own initiative, under Captains Tute and Carver, the first English expedition to explore the upper Mississippi and Great Lakes region, but it failed to penetrate to the Pacific as intended. Rogers's ambitions caused him to be tried for treason but he was acquitted. He again went to England to retrieve his fortune but was unsuccessful. During the Revolutionary War he came to America but was regarded as a loyalist spy. He then openly joined the British and organized and commanded the Queen's Rangers which saw service in operations around New York City. Later he organized the King's Rangers, but the command was taken by his brother, James Rogers, and Robert Rogers returned to England, where he lived in obscurity until his death in 1795.

There is a scholarly biography by Allan Nevins of 172 pages in the Canton Club edition of *Pontschar* (Chicago, 1914). See also F. Parkman, *Monticam and Wolfe* (Boston, 1884).

ROGERS, SAMUEL (1763-1855), English poet, was born at Newington Green, London, on July 30, 1763. His father, Thomas Rogers, was the son of a Stourbridge glass manufacturer, who was also a merchant in Cheapside. Thomas Rogers had a place in the London business, and married Mary Radford, daughter of his father's partner, becoming himself a partner shortly afterwards. On his mother's side Samuel Rogers was connected with the Nonconformist divines Philip and Matthew Henry, and it was in Nonconformist circles at Stoke Newington that he was brought up. He was educated at private schools at Hackney and Stoke Newington. Samuel Rogers entered the banking business in Cornhill, but his delicate health necessitated long holidays, during which he met the literary society of the day in Edinburgh as well as in London. He had already published a volume of verse when his *Pleasures of Memory* was printed in 1792. This poem may be regarded as the last embodiment of the poetic diction of the 18th century. Here is carried to the extreme pitch the theory of elevating and refining familiar themes by abstract treatment and lofty imagery.

In 1793 his father's death gave Rogers the principal share in the banking house in Cornhill, and a considerable income. He left Newington Green in the same year and established himself in chambers in the Temple. In his circle of friends at this time were "Conversation" Sharp and the artists Flaxman, Opie, Martin Shee and Fuseli. He also made the acquaintance of Charles James Fox, with whom he visited the galleries in Paris in 1802, and whose friendship introduced him to Holland House. In 1803 he moved to 22 St. James's Place, where for 50 years he entertained all the celebrities of London. Flaxman and Stothard had a share in the decorations of the house, which Rogers had almost rebuilt, and now proceeded to fill with pictures and other works of art. His collections at his death realized £50,000. An invitation to one of Rogers's breakfasts was a formal entry into literary society, and his dinners were even more select. His social success was due less to his literary position than to his powers as a conversationalist, his educated taste in all matters of art, and no doubt to his sarcastic and bitter wit, for which he excused himself by saying that he had such a small voice that no one listened if he said pleasant things. Above all, he seems to have had a genius for benevolence. "He certainly had the kindest heart and unkindest tongue of any one I ever knew," said Fanny Kemble. He helped the poet Robert Bloomfield, he reconciled Moore with Jeffrey and with Byron, and he relieved Sheridan's difficulties in the last days of his life. Moore, who refused help from all his friends, and would only be under obligations to his publishers, found it possible to accept assistance from Rogers. He procured a pension for H. F. Cary, the translator of Dante, and obtained for Wordsworth his sinecure as distributor of stamps.

Rogers played the part of literary dictator in England over a long period. He made his reputation by *The Pleasures of Memory* when Cowper's fame was still in the making. He became the friend of Wordsworth, Scott and Byron, and lived long enough to give an opinion as to the fitness of Alfred Tennyson for the post of poet laureate. Alexander Dyce, from the time of his first introduction to Rogers, was in the habit of writing down the anecdotes with which his conversation abounded. From the mass of material thus accumulated he made a selection which he arranged under various headings and published in 1856 as *Recollections of the Table-Talk of Samuel Rogers, to which is added Personiana*. Rogers himself kept a notebook, in which he entered impressions of the conversation of many of his friends—Charles James Fox, Edmund Burke, Henry Grattan, Richard Porson, John Horne Tooke, Talleyrand, Lord Erskine, Sir Walter Scott, Lord Grenville and the duke of Wellington. They were published by his nephew William Sharpe in 1859 as *Recollections by Samuel Rogers; and Reminiscences and Table-Talk of Samuel Rogers, Banker, Poet, and Patron of the Arts, 1763-1855* (1903), by G. H. Powell, is an amalgamation of these two authorities. Rogers held various honorary positions: he was one of the trustees of

the National Gallery; and he served on a commission to inquire into the management of the British Museum, and on another for the rebuilding of the houses of parliament.

Rogers's later works are *An Epistle to a Friend* (Richard Sharp) (1798); *The Voyage of Columbus* (1810); *Jacqueline* (1814), a narrative poem; *Human Life* (1819) and *Italy* (1822-28). Rogers was in Italy in 1814 and again in 1830, when he visited Byron and Shelley at Pisa. The 1828 edition of *Italy* was not a success. But in an enlarged form the poem was republished in 1830, and in 1838 a sumptuous edition of *Poems* was brought out. Rogers declined the laureateship in 1850 when upon the death of Wordsworth it was offered him. He died in London on Dec. 18, 1855.

See P. W. Claydon, *The Early Life of Samuel Rogers* (1887) and *Rogers and his Contemporaries* (3 vols., 1889); Dyce, *Reminiscences and Table-Talk of Samuel Rogers* (1856, ed. Powell, 1903); Roberts, *Samuel Rogers and his Circle* (1910).

ROGERS, WILL (1879-1935), popular American humorist and motion picture actor, was born Nov. 4, 1879 at Oolagh, Indian Territory (now Oklahoma). He began his career in the humble rôle of a rope-throwing cowboy on the vaudeville stage but rose to wealth and world fame as a humorist and political commentator in the cherished home-spun tradition of the old frontier. He was flying over Alaska with Wiley Post in the latter's plane when on Aug. 15, 1935 they crashed and both were killed.

ROGERS, WILLIAM (1819-1896), English clergyman and educational reformer, was born in London on Nov. 24, 1819, and died there on Jan. 19, 1896. Educated at Eton and at Balliol college, Oxford, he entered Durham university in 1842, to study theology, and was ordained in 1843. In 1845 he was appointed to St. Thomas Charterhouse, where he remained for 18 years, throwing himself passionately into the work of education of his poor, degraded and often criminal parishioners. He began by establishing a school for ragamuffins in a blacksmith's abandoned shed, and he gradually extended its scope until schools were provided throughout the parish. In 1863 he became rector of St. Botolph Bishopsgate, a prebendary of St. Paul's, and in 1867 chaplain in ordinary to the Queen. At Bishopsgate Rogers tackled the middle-class schools. He believed in secular education, leaving doctrinal training to parents and clergy. To the cry against "godless education," Rogers replied, "Hang theology; let us begin"; and his nickname of "Hang-theology Rogers" stuck to him for the rest of his life. Rogers reconstructed Edward Allen's charity at Dulwich. He founded the Bishopsgate Institute.

ROGIER, CHARLES LATOUR (1800-1885), Belgian statesman, descended from a Belgian family settled in the department of the Nord in France, was born at St. Quentin on Aug. 17, 1800. His father, an officer in the French army, perished in the Russian campaign of 1812; and the family moved to Liège, where the eldest son, Firmin, held a professorship. Charles, after being called to the bar, founded, in collaboration with his lifelong friends, Paul Devaux and Joseph Lebeau, the journal *Mathieu Laensberg* (afterwards *Le Politique*), which by its ardent patriotism and its attacks on the Dutch administration soon acquired a widespread influence. When the insurrection of 1830 broke out at Brussels, Rogier put himself at the head of 150 Liégeois, and inscribing on his banner the motto, "Vaincre ou mourir pour Bruxelles," he obtained arms from a local factory, and marched upon the capital. Here he took his place at once among the leaders of the revolutionary party. His influence saved the town hall from pillage on Sept. 10.

On the 24th a *commission administrative* was formed, of which Rogier became president. The energetic measures of this body and of its successor, the *gouvernement provisoire*, soon freed the greater part of the country from the Dutch troops. Rogier was sent in October to suppress an outbreak among the colliers of Hainaut, and then as delegate of the provisional government to Antwerp, where the citadel still held out for Holland. He arranged an armistice, and reorganized the entire administration of the city. He sat for Liège in the National Congress, voted for the establishment of an hereditary monarchy, and induced the congress to adopt the principle of an elective second chamber. In the long-drawn debates on the bestowal of the crown he ranged himself on the side of Louis Philippe: but when Louis Philippe de-

clined the crown on behalf of his son, Rogier voted with the majority for Leopold of Saxe-Coburg.

In June 1831 he was appointed governor of the province of Antwerp, a post rendered exceptionally difficult by the continued presence of Dutch troops in the citadel. In October 1832 he was made minister of the interior in the Goblet-Devaux cabinet. During his office he carried, in the teeth of opposition, a law that established in Belgium the first railways on the continent of Europe, and thus laid the foundation of her industrial development. Owing to dissensions in the cabinet, he retired in 1834, together with Lebeau, and resumed the governorship of Antwerp. On Lebeau's return to power in 1840, Rogier became minister of public works and education. His education proposals were defeated by the Clerical party, and on the resignation of the ministry in 1841, Rogier gave his support to a compromise measure, which passed into law in 1842. He led the Liberal party in Opposition till 1847, when he formed a cabinet in which he held the ministry of the interior. He carried out a liberal policy which enabled Belgium to escape the general revolutionary movement of 1848.

Rogier retired in Oct. 1852, but was brought back into office by the liberal reaction of 1857. He again became president of the council and minister of the interior in a cabinet of which Frère-Orban was the most conspicuous member. The first important measure passed by the ministry was one for the fortification of Antwerp. In 1860 the fear of French designs on the independence of Belgium led to a movement of reconciliation with Holland, and inspired Rogier to write his poem "La Nouvelle Brabançonne." In 1861 Rogier exchanged the ministry of the interior for that of foreign affairs. He achieved a diplomatic triumph in freeing the navigation of the Scheldt, and thus enabling Antwerp to become the second port on the mainland of Europe. Defeated at Dinant, he sat for Tournai from 1863 till his death. In 1868 Rogier finally retired from power. He continued, however, to take part in public life, and was elected president of the extraordinary session of the chamber of representatives in 1878. From this time his age, his devoted patriotism and the unassuming simplicity of his life made him the idol of all classes. He died at Brussels on May 27, 1885, and was accorded a public funeral.

See T. Juste, *Charles Rogier, 1800-1885, d'après des documents inédits* (Verriers, 1885).

ROHAN, the name of one of the most illustrious of the feudal families of France, derived from that of a small town in Morbihan, Brittany, and claimed connection with the ancient sovereigns of Brittany. Hercule de Rohan, duc de Montbazou (1568-1654) served Henry III. and Henry IV. against the League, and was made by Henry IV. governor of Paris and the Isle of France, and master of the hounds. His grandson, Louis de Rohan-Guéméné, the chevalier de Rohan, conspired with the Dutch against Louis XIV. and was beheaded in Paris in 1674. In the 18th century the Soubise branch of the family furnished several prelates, cardinals and bishops of Strasbourg, among others the famous cardinal de Rohan, the hero of the affair of the diamond necklace. René de Rohan, seigneur of Pontivy and Frontenay, of the Glé branch, commanded the Calvinist army in 1570, and defended Lusignan with great valour when it was besieged by the Catholics (1574-75). His son Henry, the first duke of Rohan (q.v.), had an only child, Marguerite de Rohan, married in 1645 to Henri Chabot. The property and titles of Henry de Rohan thus passed to the Chabot family, which under the name of Rohan-Chabot produced some distinguished soldiers and a cardinal archbishop of Besançon.

ROHAN, HENRI, Duc DE (1579-1638), French soldier, writer and leader of the Huguenots, was born at the château of Blain, in Brittany, in 1579. His father was René II., count of Rohan (1550-86). Henri appeared at court and in the army at the age of sixteen, and was a special favourite with Henry IV., after whom, failing the house of Condé, he might be said to be the natural chief of the French Protestants. Having served till the peace of Vervins, he travelled for some time. On his return to France he was made duke and peer at the age of twenty-four, and two years later (1603) married Marguerite de Béthune, the

duc de Sully's daughter. He fought from time to time in the royal army, and it was not till the decree for the restitution of church property in the south threw the Bearnese and Gascons into open revolt that Rohan appeared as a rebel. His ability and constancy contributed to the happy issue of the war for the Huguenots, and brought about the treaty of Montpellier (1623). Rohan renewed the war when the compact of Montpellier was broken. Again a hollow peace was patched up, but it lasted but a short time, and Rohan undertook a third war (1627-29), the first events of which are recounted in his celebrated *Mémoires*. After the peace he made his way to Venice, where his hosts wished to make him their general-in-chief, a design not executed owing to the peace of Cherasco (1631). At Venice he wrote his *Mémoires*; at Padua, *Le Parfait Capitaine*. Rohan returned to the French service, and was entrusted with the war in the Valtelline (1633). But Rohan was still considered dangerous to France, and was soon again in retirement. At this time he wrote his *Traité du gouvernement des treize cantons*. Rohan fought another Valtelline campaign, but without the success of the first, for the motives of France were now held in suspicion. The unfortunate commander retired to Geneva and thence went to the army of Bernhard of Saxe-Weimar. He received a mortal wound at the battle of Rheinfelden on Feb. 28, 1638, and died at the abbey of Königsfeld, canton Berne, on April 13.

Rohan's *Mémoires sur les choses qui se sont passées en France*, etc., rank amongst the best memoirs of the 16th and 17th centuries. The first three books which deal with the civil wars appeared in 1644; the fourth, containing the narrative of the Valtelline campaigns, not till 1728. His famous book on the history and art of war, *Le Parfait Capitaine*, appeared in 1631 and subsequently in 1637 and 1603 (see also Quincy, *Art de la guerre*, Paris, 1741). The *Mémoires* may be conveniently found in the collection of Michaud and Poujoulat, vol. 29.

See Fauvellet de Foix, *Histoire du Duc Henri de Rohan* (1667); Schybergson, *Le Duc de Rohan et la charte du parti protestant en France* (1880); Bühring, *Venedig, Gustaf Adolf, und Rohan* (Halle, 1885); Laugel, *Henri de Rohan, son rôle politique et militaire* (1889); Veraguth, *Henri de Rohan und seine Mission in Graubünden* (Berne, 1894); and Shadwell, *Mountain Warfare*.

ROHAN, LOUIS RENÉ EDOUARD, CARDINAL DE (1734-1803), prince de Rohan-Guéméné, archbishop of Strasbourg, a cadet of the great family of Rohan, was born at Paris on Sept. 25, 1734. After taking orders, in 1760, he was nominated coadjutor to his uncle, Constantine de Rohan-Rochefort, archbishop of Strasbourg, and he was also consecrated bishop of Canopus. But he preferred the gaiety of Paris to his clerical duties, and had political ambitions. He joined the party opposed to the Austrian alliance, which had been cemented by the marriage of the archduchess Marie Antoinette to the dauphin. This party was headed by the duc d'Aiguillon, who in 1771 sent Prince Louis on a special embassy to Vienna to find out what was being done there with regard to the partition of Poland. Rohan arrived at Vienna in Jan. 1772, and made a great noise with his lavish fêtes. But the empress Maria Theresa was implacably hostile to him; not only did he attempt to thwart her policy, but he spread scandals about her daughter Marie Antoinette, laughed at Theresa, and shocked her ideas of propriety. On the death of Louis XV. in 1774, Rohan was recalled from Vienna, and coldly received at Paris; but in 1777 he was made grand almoner, and in 1778 abbot of St. Vaast. In 1778 he was made a cardinal on the nomination of Stanislaus Poniatowski, king of Poland, and in the following year succeeded his uncle as archbishop of Strasbourg and became abbot of Noirmoutiers and Chaise-Dieu.

In an attempt to procure his reinstatement at court he fell into the hands of the comtesse de Lamotte, the notorious Cagliostro and others, whose actions form part of the "affair of the diamond necklace" (see DIAMOND NECKLACE). Rohan certainly was led to believe that his attentions to the queen were welcomed, and that his arrangement by which she received the famous necklace was approved. He was the dupe of others, and at the trial in 1785 his acquittal was received with universal enthusiasm, and regarded as a victory over the court and the queen. He was deprived, however, of his office as grand almoner and exiled to his abbey of Chaise-Dieu. He was soon allowed to

return to Strasbourg, and was elected to the states-general. As a prince of the church in Jan. 1791 he refused to take the oath to the constitution, and went to Ettienenheim, in the German part of his diocese. He spent what wealth remained to him in providing for the poor clergy of his diocese who had been obliged to leave France; and in 1801 he resigned his nominal rank as archbishop of Strasbourg. On Feb. 17, 1803, he died at Ettienenheim.

BIBLIOGRAPHY.—The *Mémoires* of his secretary, the abbé Georcel, of the Barons d'Oberkirch, of Beugnot and of Madame Campan, also J. Munier-Jolain, *Le Cardinal Collier; lettres à . . . de Marie Thérèse* (1918); J. D. Chamier, *The Dubious Tale of the Diamond Necklace* (London, 1939).

ROHILKHAND, a tract in Uttar Pradesh (United Provinces), India. The name is associated with the Rohilla tribe, but in its historical significance it covers an area almost coincident with the modern division of Bareilly, for which it is a common alternative title. This division has an area of 10,865 sq.mi. and comprises the districts of Bareilly, Bijnor, Budau, Moradabad, Shahjahanpur and Pilibhit. Pop. (1941) 6,195,996. Political control over the state of Rampur was exercised by the commissioner for the division.

The Rohillas trace their ancestry to Sardar Daud Khan, an Afghan adventurer, whose adopted son annexed a large area north of the Ganges and was created a nawab by the Delhi emperor. He died in 1749, and the family split up into a number of petty chieftains. In 1774 (see BRYNOR) the Rohilla power was broken by the confederacy of the British and the nawab of Oudh. The state of Rampur was left under the sovereignty of Nawab Faizullah Khan, and the rest of Rohilkhand was annexed to Oudh. The division was ceded to the East India company in 1801.

ROHILLA, a Pushtu word for "mountaineer" applied to a tribe of Afghan marauders, who, toward the beginning of the 18th century, conquered a district of Hindustan, giving it the name of Rohilkhand (Bareilly in the United Provinces). They are chiefly notable for their association with Warren Hastings (q.v.), who assisted the Wazir of Oudh in the annexation of their territory in the Rohilla war.

See Charles Hamilton, *History of the Rohilla Afghans* (1787); Sir J. Strachey, *Hastings and the Rohilla War* (Oxford, 1892).

ROHTAK, a town and district of India, in the Punjab. The town, which is of great antiquity, became the headquarters of a British district in 1824. Viewed from the sandhills to the south, Rohtak, with its white mosque in the centre, a fort standing out boldly to the east, is striking and picturesque. It has a station on the Southern Punjab railway, 44 mi. N.W. of Delhi. Population (1941) 48,148. It is an important trade centre, with factories for spinning and pressing cotton and a specialty in muslin turbans.

The district of Rohtak has an area of 2,246 sq.mi. It is situated in the midst of the level tableland between the Jumna and the Sutlej, and the northern portions are watered by the Rohtak and Butana branches of the Western Jumna canal; but the greater portion of the central plain is entirely dependent upon the uncertain rainfall. The population in 1941 was 956,399.

ROKITANSKY, CARL (1804-1878), the founder of the Vienna school of pathological anatomy, was born on Feb. 19, 1804, at Königgrätz, Bohemia. He studied medicine at Prague and at Vienna, where he became professor of pathological anatomy in 1834. In 1847 he made medicolegal anatomist to the city, and from 1863 he advised the ministry of education on all routine matters of medical teaching. He became president of the Imperial Academy of Sciences in 1869. He died in Vienna on July 23, 1878.

Carl Rokitansky's *Handbuch der pathologischen Anatomie* (1842-46; Eng. trans. 1849-52) is said to have been based on 30,000 post-mortem examinations. Four important memoirs (on the anatomy of goitre, cysts, diseases of arteries and defects in the septum of the heart) appeared in the *Denkschriften* of the Vienna Academy of Sciences. Among his remaining papers are three philosophical essays: "Freedom of Inquiry" (1862), "The Independent Value of Knowledge" (1867) and "Solidarity of Animal Life" (1869).

ROLAND [ROLAND DE LA PLATÈRE], **JEAN MARIE** (1784-1793), French statesman, was born at Thizy on Feb. 18,

1784. Intending to seek his fortune abroad, he went on foot to Nantes, but illness obliged him to give up his project. After working as a clerk, he joined a relative who was inspector of manufactures at Amiens, and himself rose to the position of inspector.

In 1780 he married Jeanne Maçon Philpon (1754-93), famous in history as Madame Roland. She was the daughter of Gratien Philpon, a Paris engraver. About the year 1785 the Rolands moved to Lyons. A correspondence sprang up with J. P. Brissot and other friends of the revolution in Paris, and in 1791 the Rolands settled there.

Jean Roland became a member of the Jacobin club. Madame Roland's salon soon became the rendezvous of Brissot, Jérôme Pétion de Villeneuve, Robespierre and other leaders of the popular movement, above all of F. N. L. Buzot, whom she loved with platonic enthusiasm. In person Madame Roland was attractive though not beautiful; her ideas were clear and far-reaching, her manner calm and her power of observation extremely acute.

On March 23, 1793, Roland was appointed minister of the interior. As a minister of the crown Roland exhibited a bourgeois brusqueness of manner and a remarkable combination of political prejudice with administrative ability. The decrees against the emigrants and the nonjuring clergy still remained under the veto of the king. A letter was penned by Madame Roland and addressed by her husband to Louis. It remained unanswered. Thereupon, in full council and in the king's presence, Roland read his letter aloud. It contained many and terrible truths as to the royal refusal to sanction the decrees and as to the king's position in the state; but it was inconsistent with a minister's position, disrespectful if not insolent in tone. Roland's dismissal followed. He then read the letter to the assembly; it was ordered to be printed, became the manifesto of disaffection and was circulated everywhere.

After the insurrection of Aug. 10, Roland was recalled to power, one of his colleagues being G. J. Danton, but he was dismayed by the progress of the revolution. He was above all a provincial, and was soon in opposition to the party of the Mountain. He was hostile to the insurrectional commune of Paris, and proposed transferring the government to Blois; he attacked Robespierre and his friends. His neglect to seal the iron chest discovered in the Tuilleries, which contained the proofs of Louis XVI's relations with the enemies of France, led to the accusation that he had destroyed a part of these documents. Finally, in the trial of the king he demanded, with the Girondists, that the sentence should be pronounced by a vote of the whole people, and not simply by the convention. He resigned office on Jan. 23, 1793, two days after the king's execution.

The Rolands remained in Paris. Once Madame Roland appeared personally in the assembly to repel the falsehoods of an accuser, and secured acquittal. But violence succeeded violence, and early on the morning of June 4, she was arrested and imprisoned in the Abbaye. Roland himself escaped secretly to Rouen. Released for an hour from the Abbaye, Madame Roland was again arrested and thrown among the horrors of Sainte-Pélagie. Finally, she was transferred to the Conciergerie. In prison she won the affections of the guards, and was allowed the privilege of writing materials and the occasional visits of devoted friends. She there wrote her *Appel à l'impartiale postérité*, those memoirs which display a strange alternation between self-laudation and patriotism, between the trivial and the sublime. On Nov. 8, 1793, she was guillotined. Before her execution, she bowed before the clay statue of Liberty erected in the Place de la Révolution, uttering her famous apostrophe—"O Liberty! what crimes are committed in thy name!" When Roland heard of his wife's condemnation, he wandered several miles from his refuge in Rouen; maddened by despair and grief, he wrote a few words expressive of his horror at those massacres which could be inspired only by the enemies of France, protesting that "from the moment when I learned that they had murdered my wife I would no longer remain in a world stained with enormities." He affixed the paper to his breast, and unsheathing a sword-stick fell upon the weapon, which pierced his heart, on Nov. 10, 1793.

Madame Roland's *Mémoires*, first printed in 1820, have been edited

among others by P. Faugère (1864), by C. A. Dauban (1864), by J. Claretie (1884), and by C. Perroud (1905). Some of her *lettres inédites* have been published by C. A. Dauban (1867); C. Perroud published a critical edition of her *lettres* (1900-02), and a new series (1907-86) in 1913-15. See also C. A. Dauban, *Étude sur Madame Roland et son temps* (1864); V. Lamy, *Deux femmes célèbres, Madame Roland et Charlotte Corday* (1884); C. Badier, *Madame Roland, d'après des lettres et des manuscrits inédits* (1892); A. J. Lambert, *Le mariage de Madame Roland, trois années de correspondance amoureuse* (1896); Austin Dobson, *Four Frenchwomen* (1890); articles by C. Perroud in the review *La Révolution française* (1896-99); U. Birch, *Madame Roland, a Study in Revolution* (1917).

ROLAND, LEGEND OF. The legend of the French epic hero Roland (transferred to Italian romance as Orlando) is based on authentic history. Charlemagne invaded Spain in 778, and had captured Pamplona, but failed before Saragossa, when the news of a Saxon revolt recalled him to the banks of the Rhine. On his retreat to France through the defiles of the Pyrenees, part of his army was cut off from the main body by the Basques and entirely destroyed. The incident is related in Einhard's *Vita Karoli* (cap. ix.; Pertz. ii. 448), where the names of the leaders are given. "In this battle were slain Egghard praepositus of the royal table; Anselm, count of the palace; and Hruodland, praefect of the Breton march. . . ." The scene of the disaster is fixed by tradition at Roncevaux, on the road from Pamplona to St. Jean Pied de Port. The fiction of the 12 peers may possibly arise from a still earlier tradition. In 636-637, according to the *Chronicles* of Fredegarius (ed. Krusch, p. 159), 12 chiefs, whose names are given, were sent by Dagobert against the Basques. The expedition was successful, but in the valley of Subola, identified with Mauléon, near Roncevaux, the Duke Harembert, with other Frankish chiefs, was slain. Later fights in the same neighbourhood and under similar circumstances are related in 813 (*Vita Hrodowici*; Pertz. ii. 616), and especially in 824 (Einhard's *Annales*; Pertz. i. 213). These incidents no doubt served to strengthen the tradition of the disaster to Charlemagne's rearguard in 778, the importance of which was certainly magnified in popular story.

The choice of Roland or Hruodland as the hero probably points to the borders of French Brittany as the home of the legend. The exaggeration of a rear-guard action into a national defeat; the substitution of a vast army of Saracens for the border tribe mentioned by Einhard; and the vengeance inflicted by Charlemagne, where in fact the enemy escaped with complete impunity—all are in keeping with the general laws of romance. Charlemagne himself appears as the ancient epic monarch, not as the young man he really was in 778. There is evidence of a continuous tradition dating from the original event and, as Roncevaux lay on the route to Compostella, the many pilgrims who must have passed the site, from the middle of the 9th century onwards, may have helped to spread the story. Whether the actual *cantilena Rollandi* chanted by Taillefer at the battle of Hastings (William of Malmesbury, *De gestis regum angl.* iii. 242, and Wace, *Brut.* ii. 11, 8035 seq.) was any part of the existing *Chanson de Roland* cannot be stated, but the choice of the legend on this occasion by the trouvère is proof of its popularity.

The oldest extant forms of the legend are: (a) chapters xix-xxx. of the Latin chronicle, known as the *Pseudo-Turpin*, which purports to be the work of Turpin, archbishop of Reims, who died about 800, but probably dates from the 12th century; (b) *Carmen de proditiōne Guenonis*, a poem in Latin distichs; and (c) the *Chanson de Roland*, a French *chanson de geste* of about 4,000 lines, the oldest recension of which is in the Bodleian library, Oxford (ms. Digby, 23). It is in assonanced *hérodes*, of unequal length, many of them terminated with the refrain *Aoi*. This ms. was written by an Anglo-Norman scribe about the end of the 12th century, and is a corrupt copy of a text by a French trouvère of the middle of the 11th century. The poem, which was first printed by Francisque Michel (Oxford, 1837) is the finest monument of the heroic age of French epic.

The *Pseudo-Turpin* represents a different recension of the story and is throughout clerical in tone. It was the trouvère of the *Chanson de Roland* who developed the characters into epic types; he invented the heroic friendship of Roland and Oliver, the motives of Ganelon's treachery, and many other details.

The famous fight between Roland and the giant Ferragus appears in the *Pseudo-Turpin* (ch. xviii.), but not in the poem. The *Chanson de Roland* contains allusions to many events outside the narrative, some of which refer to *chansons* which are lost. Roland was variously represented by the romancers as the son of Charlemagne's sister Gilles or Berte and the knight Milon d'Anglers. The romantic episode of the reconciliation of the pair with Charlemagne through Roland's childish prattle (*Berte et Milon*) is probably foreign to the original legend. His *enfances*, or youthful exploits, were, according to *Aspremont*, performed in Italy against the giant Eaumont, but in *Girais de Vienne* his first taste of battle is under the walls of Vienne, where Oliver, at first his adversary, becomes his brother-in-arms.

In the 12th century the *Chanson de Roland* was modernized by replacing the assonance by rhyme. Several mss. of this rhymed recension, sometimes known as *Roncevaux*, are preserved. The English romances of Charlemagne (*q.v.*) are mostly derived from late and inferior sources. It was in Italy that the Roland legend had its greatest fortune; Charlemagne and Roland appear in the *Paradiso* (canto xviii.) of Dante; the statues of Roland and Oliver appear on the doorway of the cathedral of Verona; and the French *chansons de geste* regularly appeared in a corrupt Italianized French.

BIBLIOGRAPHY.—For a complete bibliography of the editions of the various mss. of the *Chanson de Roland*, of the foreign versions, and of the enormous literature of the subject, see Léon Gautier, *Les Épopées françaises* (2nd vol. iii. 1886) and the same author's *Bibliographie des chansons de geste* (1897). See also P. Boissonade, *Du Nouveau sur le Chanson de Roland* (1903). Among critical editions of the *Chanson* are those by Wendelin Foerster in the *Altfranz. Bibliothek*, vols. vi. and vii. (Heilbronn, 1883-86), and by E. Stengel *Das altfranzösische Rolandlied* (Leipzig, 1900, etc.). The most popular edition is *La Chanson de Roland* (Tours, 1879; and numerous subsequent editions), by Léon Gautier. L. Petit de Julleville published in 1878 an edition with the old French text, and a modern French translation in assonanced verse. There are English translations in prose by I. Butler (Boston, Mass., 1904); in verse by A. Way and F. Spencer (1895); and "in the original measure" by C. S. Moncrieff (1919). Consult further G. Paris, *Hist. poet. de Charlemagne* (reprint, 1905), and *De Pseudo Turpino* (Paris, 1865); F. Rains, *Le Origini dell'epopea francese* (Florence, 1884); and *Le Fanti dell' Orlando Furioso* (ed. Florence, 1907); F. Picco, *Roland nella storia e nella poesia* (Turin, 1907); G. Paris, "Roncevaux," in *Legendes du moyen âge* (1903), on the topography of the battlefield.

ROLANDSECK, a village in the Prussian Rhine province, Germany, situated on the left bank of the Rhine, 8 mi. above Bonn, with a station on the railway Cologne-Coblenz. The place consists almost entirely of villas and is a favourite summer resort. Behind it lie the ruins of the castle.

ROLL. Primarily the word "roll" is used of a piece of writing material, such as parchment or paper, which is rolled up for the purpose of convenient storage or handling, in which form it represents an early stage in the evolution of the book, an example being the Rotulus or Rodl of Joshua of c. 700 in the Vatican library. By extension it became the name for any document kept in this form as an official record, and hence for any register, record, catalogue or official list. ("The Rolls" was the name of the building where the records of the chancery court, a division of the English high court of justice, were kept, the keeper of which was the Master of the Rolls (*q.v.*), now the title of the third member of the English supreme court of judicature. The word is used in this sense for the list of those admitted as qualified solicitors, whence the phrase "to strike off the rolls" of removal by the court of a solicitor for offences or delinquencies.

In architecture, a "roll" or "scroll" moulding is one resembling a section of a roll or scroll of parchment with the end overlapping; a "roll and fillet" moulding is a section of a cylindrical moulding with a square fillet running along the centre of the face (see LABEL).

ROLLAND, JOHN (fl. 1560), Scottish poet, appears to have been a priest of the diocese of Glasgow, and to have been known in Dalkeith in 1555. He is the author of two poems, the *Court of Venus* and a translation of the *Seven Sages*. The former, which was printed by John Ros in 1575, may have been written before 1560. The latter was translated from a Scots prose version.

The *Court of Venus* was edited by Walter Gregor (1884). The *Seven*

Sager was printed in 1578, and reprinted by David Laing (1837).

ROLLAND, ROMAIN (1866-1944), French man of letters, was born at Clamecy, Nièvre, on Jan. 29, 1866. He was educated at Clamecy, and later in Paris, where he had a distinguished academic career. From 1889-91 he was a member of the French School in Rome, and in 1895 became professor of art history at the Ecole Normale Supérieure. Later he was appointed professor at the Sorbonne, where he introduced the study of the history of music. He produced many critical and historical works, among them *Les origines du théâtre lyrique moderne, Histoire de l'opéra en Europe avant Lulli et Scarlatti* (1895); *Des causes de la décadence de la peinture italienne* (1895); *Le théâtre du peuple* (1901), besides studies on Millet (1902); Beethoven (1903) and Michel-Ange (1906); *Les Tragédies de la foi, Saint Louis, Aert, Le Triomphe de la raison* (1913). His most famous work, however, is the romance of *Jean-Christophe* (1904-12), the biography of a German musician. It is in three series, *Jean-Christophe, Jean-Christophe à Paris* and *La Fin du Voyage*, and appeared in 10 volumes, the first *L'aube*, in 1904, and the last *La Nouvelle Journée*, in 1912.

When World War I broke out Rolland was in Switzerland, and although his open letter to Hauptmann expressed his horror of the burning of Louvain, he became extremely unpopular in France owing to a series of articles published in the *Journal de Genève* during Sept. and Oct. 1914. These articles were subsequently published in book form under the title *Au-dessus de la mêlée*. Although his reputation in France suffered from his political views, it increased abroad, and the performances of *Danton* and *Le 14 juillet*, which with *Les Loups* and *Le Jeu de l'Amour et de la mort* belong to his *Théâtre de la Révolution* (1909), caused a furore in Berlin. His work *Mahatma Gandhi* (1922) is an impassioned defense of the Indian leader. His later works include: *Colas Breugnot* (1918); *Les précurseurs* (1919); *Claramonte, Pierre et Lucie* (1919); *Voyage musical aux pays du passé* (1919); *Lilith* (1919). In 1922 appeared the first volume of a series entitled *L'Âme Enchantée*. To this series belong *Amette* and *Sylvia* (1922), *L'Éti* (1924), *Mère et Fils* (1927), *Beethoven the Creator* (1929). Rolland received the Nobel prize for literature in 1915. He died in Vézelay, France, Dec. 30, 1944.

See Jan Romain, *Romain Rolland* (1918); I. Debrun, *M. R. Rolland, initiateur de défaitisme* (1918); W. Kuehler, *Romain Rolland* (1919).

ROLLE DE HAMPOLE, RICHARD (d. 1349), English hermit and author, was born near the end of the 13th century, at Thornton (now Thornton Dale), near Pickering, Yorkshire. His father, William Rolle, was perhaps a dependant of the Neville family. Richard was sent to Oxford at the expense of Thomas de Neville, afterwards archdeacon of Durham. At Oxford he gave himself to the study of religion rather than to the subtleties of scholastic philosophy, for which he professed a strong distaste. At the age of 19 he returned to his father's house, and, making a rough attempt at a hermit's dress, he ran away to follow the religious vocation. At Dalton, near Rotherham, he was recognized by John de Dalton, who had been at Oxford with him. After satisfying himself of Rolle's sanity, Dalton's father provided him with food and shelter and a hermit's dress. Rolle then entered on the contemplative life, passing through the preliminary stages of purification and illumination, which lasted for nearly three years, and then entering the stage of sight, the full revelation of the divine vision. He is very exact in his dates, and attained, he says, the highest stage of his ecstasy four years and three months after the beginning of his conversion.

Richard belonged to no order, though he seems to have desired to form a rule of hermits, but met with much opposition. He finally contented himself with advising those who sought him out. He began also to write the songs and treatises by which he was to exert his widest influence. He settled in Richmondshire, 12 miles from the recluse Margaret Kirkby, whom he had cured of a violent seizure. To her some of his works are dedicated. Finally he removed to Hampole, near Doncaster, where he died on Sept. 29, 1349.

Richard Rolle had a great influence on his own and the next

generation. In his exaltation of the spiritual side of religion over its forms, his enthusiastic celebration of the love of Christ, and his assertion of the individualist principle, he represented the best side of the influences that led to the Lollard movement. He was himself a faithful son of the church, and the political activity of the Lollards was quite foreign to his teaching. The popularity of his devotional writings is attested by the numerous existing editions and by the many close imitations of them.

A very full list of his Latin and English works is given (pp. 36-43) in Dr. Carl Horstmann's edition (1895-96) of his works in the Library of Early English Writers.

Richard Rolle's Latin treatises, *De emendatione vitae* and *De incendio amoris*, the latter one of the most interesting of his works, because it is obviously largely autobiographical, were translated (1434-35) by Richard Misyng (ed. R. Harvey, Early English Text Soc., 1896 and by F. M. M. Compier in 1912). The *De emendatione de vitae* was also edited with an introduction, by D. Harford (1913). The *Prick of Conscience* was edited (1853) by Richard Morris for the Philological Society. His *Commentary on the Psalms* was edited by the Rev. H. R. Bramley (Oxford, 1884). Ten prose treatises by Richard Rolle were edited by G. Perry for the Early English Text Society in 1866, rev. ed. 1921. Partial ed. of his Latin works are Paris (1510), Antwerp (1533), Cologne (1535-36), Paris (1618); and in vol. xxvi. of the "Bibliotheca Patrum Maxima" (Lyons, 1677). The office, which forms the chief authority for Rolle's life, was printed in the *York Breviary*, vol. II. (Surtees Soc., 1882), and in Canon Perry's edition referred to above. *The Meditative Passions of Domini* was edited in 1917, with introduction, by H. Lindqvist, and the *Officium et Miracula* by R. M. Woolley in 1919. See *Richard Rolle's Version of the Penitential Psalms, with his Commentary* (1928); *The Mirror of Glits: from the works of Richard Rolle* (ed. H. R. Cross, 1928).

See also Percy Andraee, who collated 18 mss. in the British Museum in his *Handschriften des Prick of Conscience* (Berlin, 1888); *Studien über Richard Rolle von Hampole unter besonderer Berücksichtigung seiner Psalmencommentare*, by H. Middendorff (Magdeburg, 1888), with a list of mss., sources, etc.; J. Zupitza in *Englische Studien* (Heilbronn, vols. vii. and xii.); A. Hahn, *Quellenuntersuchungen zu Richard Rolle's englischen Schriften* (Halle, 1900); and for his prosody, G. Saintsbury, *Hist. of English Prosody*, vol. I.

ROLLER, one of several birds, especially the common roller (*Coracias garrulus*), so called from its way of occasionally rolling in its flight, after the fashion of a tumbler pigeon. It is widely though not numerously spread over Europe and western Asia in summer, breeding as far N. as the middle of Sweden, but retiring to winter in Africa. It occurs almost every year as a straggler in the British islands. Except the back, scapulars and tertials, which are bright reddish-brown, the plumage of both sexes is blue (of various shades, from pale turquoise to dark ultramarine) tinted in parts with green.

The bird is purely insectivorous. *Coracias* forms the type of the family *Coraciidae*, allied to the bee-eaters (*Meropidae*) and kingfishers (*g.v.*) (*Alcedinidae*). A number of other species exist in Asia and Africa.

ROLLER: see **TILLAGE MACHINERY**.

ROLLER SKATING, a pastime which, by the use of small wheels instead of a blade on the skate, has provided some of the pleasures of skating on ice without having ice as the surface (see **SKATING**).

Wheeled skates were used on the roads of Holland as far back as the 18th century, but it was the invention of the four-wheeled skate, working on rubber pads, by J. L. Plimpton of New York, in 1863, that made the amusement popular. Still greater advance was made by the Raymond skate with ball and cone bearings.

The wheels of rollers were first of turned boxwood, but the wearing of the edges was a fault which was surmounted by making them of a hard composition or of steel. The floor of the rink on which the skating takes place is either of asphalt or of wood; the latter became the most popular material, the best floors being made of long narrow strips of maple.

ROLLESTON, THOMAS WILLIAM HAZEN (1859-1920), Irish scholar and author, was born in King's Co., Ireland, in 1857, and died at Hampstead in 1920. He was educated at St. Columba's college and at Trinity college, Dublin. He founded the *Dublin University Review* (1885-86). His works include *A Life of Lessing* (1889); *Lessing and Modern German Literature* (1900); *Sea Spray*, a book of verse (Dublin, 1909); *Parallel*

Paths, a Study in Biology, Ethics and Art (1908); and two books on Gaelic literature, *The High Deeds of Finn* (1910) and *Myths and Legends of Celtic Race* (1911).

See C. H. Rolleston, *Portrait of an Irishman* (London, 1939).

ROLLING MILL, an establishment where metal, especially iron and steel is rolled into plates and bars of various sections. (See IRON AND STEEL: *Rolling Mills*; SHEETS, IRON AND STEEL; TIN PLATE and TERNEPLATE.)

ROLLOCK, ROBERT (c. 1555–1599), the first principal of the University of Edinburgh, son of David Rollock of Powis, near Stirling, received his early education at the school of Stirling from Thomas Buchanan, a nephew of George Buchanan, and, after graduating at St. Andrews, became a regent there in 1580. In 1583 he was appointed by the Edinburgh town council sole regent of the "town's college" ("Academia Jacobi Sexti," afterward the University of Edinburgh). In 1598 he was translated to the parish church of the Upper Tolbooth, Edinburgh, and then to that of the Grey Friars (then known as the Magdalen church). He died at Edinburgh on Feb. 8, 1599. His *Select Works* were edited by W. Gunn for the Wodrow society (1844–49).

A *Life* by George Robertson and Henry Charteris was reprinted by the Bannatyne club in 1826. See also the introduction to the *Select Works*, and Sir Alexander Grant's *History of the University of Edinburgh*.

ROLLS-ROYCE LIMITED, a firm of motorcar manufacturers. A car designed by Henry Royce of the Manchester firm of Royce Ltd. was brought to the notice of C. S. Rolls of C. S. Rolls & Co., London, in the latter half of 1904. The success of this car led, in March 1906, to the merging of the Rolls and Royce interests into one company and, in Dec. 1906, a public company was floated with £200,000 capital, under the style of Rolls-Royce Ltd. In that year Royce designed the 40–50 h.p. side-valve engine chassis—known as the Silver Ghost—which was developed from that date until May 1925, when the first of the Phantom overhead-valve engine types was introduced. In 1915 Royce devoted himself to aero-engine design and produced three types of engine, known as the Hawk, Falcon and Eagle. At the end of World War I there were Rolls-Royce aero engines in service of an aggregate of more than 2,000,000 h.p. Some of the outstanding events in the Rolls-Royce post-World War I history were J. W. Alcock and A. W. Brown's nonstop transatlantic flight in a 360-h.p. Rolls-Royce Eagle engine Vickers Vimy bomber in June 1919 (this was the first direct flight across the Atlantic), the first flights to Australia and South Africa, the winning outright of the Schneider trophy in 1931, the introduction of the Kestrel, Merlin and Peregrine aero engines and the 25–30 h.p. Rolls-Royce chassis.

During World War II the firm produced the Merlin engine for fighter aircraft. It later developed a 635-h.p. Meteor engine for the Centurion, a 52-ton British tank. (M. Bu.; X.)

See H. Nockolds, *The Magic of a Name* (London, 1945).

ROMA, a town of southeast Queensland, Austr.; pop. (1947) 3,894; on the main Western railway line 318 mi. W. of Brisbane. The town's water supplies are drawn from artesian wells (depth 1,300 ft., yield c. 200,000 gal. daily). Natural gas and traces of petroleum have at times appeared in bores near Roma.

ROMAINS, JULES (1885–), French poet and novelist, was born on Aug. 26, 1885, at St.-Julien-Chapteuil in the Ardèche. He went early to Paris and spent his childhood and adolescence in Montmartre. He entered the Ecole Normale Supérieure in 1906, and graduated in philosophy in 1909. For ten years he taught philosophy in Paris and in the provinces, notably at Nice. His claim to fame is principally based on his position as one of the heads of the unanimist school of writers (Arcos, Vildrac, Duhamel, Chennevière and others). Romains's work falls into three categories: poems, novels and plays. The most important of his books of verse, *La Vie unanime* (1908), deals with what may be called the spiritual life inherent in the various groups of humanity. The *Odes et Prières* (1913) and *L'Ode génioise* (1925) should also be mentioned. Some of his novels, such as *Les Copains* (1913), owe their merit to a sort of Rabelaisian verve and truculent jollity. Others are in a loftier style. *Mort de quelq'un*

(1910) traces the brief survival of a dead man in the society in which he had lived, and how he gradually fades out of memory. The dramatic works of Jules Romains include farces, the best of which is probably *Knock* (1925), dramatic prose poems, such as *L'Armée dans la ville* (1911) and *Cromedeire-le-Vieil* (1920), and the tragedies *Le Dictateur* (1926) and *Jean le Maufranc* (1927). He went to the U.S. in 1940 and returned to France in 1945. He wrote an epic work in 27 volumes, *Les Hommes de bonne volonté* (Eng. trans. in 14 vol., 1932–46). (G. M.; X.)

ROMAN, capital of the department of Roman, Rum., on the main line from Czernowitz to Galatz, and on the left bank of the river Moldava, 2½ mi. W. of its junction with the Sereth. Pop. (1930) 28,948, about one-third being Jews. Roman has been the seat of a bishop since 1401. Its seminary dates from 1402. There are old churches, including a cathedral, built in 1541.

ROMAN ARCHITECTURE. Like the rest of Roman civilization, Roman architecture is a manifestation of the essentially direct and practical Roman mind. It is concerned not with the search for any ideal of beauty but with the solution of everyday problems. Consequently while the elements of Roman architecture are derivative, being Greek and Etruscan or rather Italic in origin, they are adapted and transformed by the Roman genius in the light of increased technical knowledge to fit altered conditions of life. The influence exerted on Roman architectural forms by the materials and methods of construction used, cannot be overestimated, and the enduring stability of Roman buildings may legitimately be held to be a result of the presence of good and durable building material. The discovery of concrete in particular gave to the Roman builders an almost imperishable material which could be moulded into a homogeneous mass exerting no thrust when set, and which thus enabled them to attack and to solve entirely new problems in spatial planning.

Building Materials.—The material employed by the Romans in their earliest buildings was *tufa*, a volcanic rock of varying hardness, some soft enough to be worked with bronze tools. Later other harder volcanic stones were used; e.g., peperino, and the stone from the Alban hills. Under the later republic and the empire the most important stone for building was *travertine*, which was quarried mainly at Tibur (Tivoli). This becomes very hard after exposure to air and weathers to a rich golden tone. An example of the use of travertine is the exterior of the Colosseum.

For their concrete the Romans used *pozzolana*, of which there are extensive beds at Pozzuoli, near Naples, and also round Rome. This is a fine chocolate-red volcanic earth, which when mixed with lime forms an excellent natural hydraulic cement which will set well even under water. With this cement was mixed an aggregate of broken tufa, travertine, brick or even marble, pumice stone being used in vaults after the 1st century A.D. to lighten the weight. Besides its extreme durability this concrete is practically indestructible by fire. It is used in all the great imperial buildings; e.g., Pantheon, baths of Caracalla and basilica of Maxentius. The new forms of architecture which were developed by the use of this material spread all over the Roman empire.

Unburnt bricks faced with stucco were used especially for private houses under the republic. It is to these bricks that reference is made in Augustus' famous saying "that he found Rome of brick and left it of marble." Of these, naturally, very few remain. Under the empire *thin-baked bricks and tiles* were the most common facing for concrete. They are never used to build a whole wall in the modern manner but merely as a protective skin. These bricks or tiles are almost always used in triangular shapes. Large tiles about 2 ft. square called *bipedales* were employed as bonding courses.

The use made by the Romans of *marble* was mainly decorative. It was applied in slabs to brick and concrete walls, and set in cement. It was used for pavements either in slabs cut and arranged in patterns, or as mosaic. Under the empire a great demand arose for coloured marbles and such stones as porphyry, granite and alabaster, which were imported from various parts of the empire. The abundant use of these marbles is well illustrated by the remains of the Flavian palace on the Palatine and of

Hadrian's villa at Tivoli.

The use of *stucco* over unbaked brick and over coarse stone was prevalent from the earliest times in Greece, Sicily and Italy. It served as a protection from the weather and also as a finish. Later it was used over brick and concrete. It was made of lime, sand and fine marble dust and would take a high polish. Thus it became the usual ground for decoration especially in the interiors of houses. Examples of its use abound at Pompeii, and in Rome in the House of Livia, in Nero's Golden House, etc. Another material the use of which was mainly decorative is *bromæ*. Doors, grills, panels of ceilings, etc., were made of it.

Construction.—Walls were built in two ways, either of ordinary masonry or of concrete (faced or unfaced). While there are several examples of early stone walling without courses (cyclopean and polygonal) especially in some of the towns, e.g., Norba, Praeneste, near Rome, most of the stone walls existing are built of squared blocks laid in regular courses as headers and stretchers (*opus quadratum*). The earliest of these walls are of tufa. Later come those of peperino and travertine. The blocks of stone in these walls are fairly large, 2 ft. x 4 ft. or more, and were often held together by iron cramps fixed in lead.

Concrete walls, except below ground, were always faced. They are divided into types according to the kind of facing used. (a) *Opus quadratum*, i.e., ordinary stone walling, is used as a facing for concrete, especially for important public buildings under the earlier empire, e.g., exterior of the Colosseum. (b) *Opus incertum* is the most common facing for ordinary concrete walls of the 2nd and 1st centuries B.C. The face of the concrete is studded with 3 in. to 4 in. irregularly shaped pieces of stone, usually tufa. (c) *Opus reticulatum* came into vogue in the 1st century B.C. and remained in use until the time of Hadrian. The construction is like that of *opus incertum* but the pieces of stone were pyramid shaped with square bases set diagonally and wedged into the concrete wall. Quoins 9 in. x 3 in. of the same material or of brick were used at the angles. (d) Brick and tile faced concrete (so called *opus testaceum*) is by far the most common material for walling under the empire. Triangular tiles were used with their points turned into the concrete and their long sides showing, thus giving the appearance of a wall built of thin bricks. Bonding courses of *bipedales* were employed at intervals of 2 or 3 feet. (e) Mixed brick and stone facing (so called *opus mixtum*) was popular under the later empire and especially under Diocletian.

The stone arch occurs frequently in Italy from the middle of the 2nd century B.C. onwards, usually in city gates, bridges and aqueducts. The discovery of concrete, however, enormously facilitated the spread of arch construction. Concrete arches were faced with stone or tile voussoirs, and with the latter *bipedales* were used at every 6th or 7th voussoir.

The vaults used by the Romans were simpler geometrical forms, i.e., the barrel vault, the intersecting (groined) barrel vault and the segmental vault. By the 1st century B.C. quite extensive systems of barrel vaulting were employed as in the substructions of the Tabularium in Rome, the temple of Hercules at Tivoli, etc. The later vaults were built up on brick rings about 2 in. apart, joined by brick bonders, forming rectangular compartments which were filled with concrete. Additional layers of concrete were laid above. When set the concrete vault exerted no thrust. The surfaces of the vaults were tile faced or covered with stucco. A fine example of Roman vaulting is the basilica of Maxentius.

The construction of domes naturally follows that of vaults. Here again the fact that the concrete dome was a dead weight without thrust was of the greatest importance in simplifying the problem. The ribs of brick were used and sometimes relieving arches as in the case of the Pantheon where the facing bricks are laid horizontally. At the crown of the dome was a brick ring.

The Orders.—There are five Orders of Roman Architecture, Tuscan, Doric, Ionic, Corinthian and Composite, Tuscan and Composite being modifications of Doric and Corinthian respectively. The rules followed by the Roman builders were elastic; few examples are of the same proportion and there was much licence allowed in execution. It has, however, been usually supposed that some system in which form and detail were definitely

standardized was essential for the construction of Roman buildings, built as they were at a high speed by ordinary workmen. Marcus Vitruvius Pollio, the Roman writer on architecture, would at any rate have us believe that imperial architecture was brought under some such rules. But the greater part of Roman architecture is later than Vitruvius, an architect and engineer who lived, and wrote in the time of Augustus. His book (*De Architectura*) is our great authority for the earlier Roman building and construction, but was primarily a handbook for architects and is based for the most part on the works of Greeks of the late 4th century B.C. and the Hellenistic period. The Renaissance exalted Vitruvius to the supreme authority on classical building; but it is none the less certain that there were no hard and fast rules, certain general proportions only being observed. It would be impossible here to treat of the details of the Roman Orders (*see* ORDER). In general the proportion is slenderer than that of the corresponding Greek Order, and there is a tendency towards greater elaboration combined with a decline in the quality of the execution. Columns are often unfuted, but the faces of the entablature left plain in Greek work are covered with decoration.

The Doric Order has almost invariably a base moulding probably taken from the Etruscan Doric or Tuscan column. Examples of Roman Doric are to be found in the Tabularium (78 B.C.) and in the lowest order of the Colosseum (A.D. 79) where it is used in conjunction with the arch. The temple of Hercules at Cori (c. 80 B.C.) is the only known Roman Doric temple.

The Ionic Order is used to a limited extent in temples and public buildings, though the number of isolated capitals found suggests that it had a certain vogue in private houses. The Romans seldom used the canted angle volute though in the temple of Saturn the capitals have four canted volutes. Other examples of this Order are the temple of Fortuna Virilis, the second orders of the theatre of Marcellus and the Colosseum, Trajan's forum at Rome and various buildings at Pompeii.

The Corinthian Order was by far the most popular with the Roman builder. It attracted by its richness and by the ease with which it could be used in any position owing to the identity of the four faces of the capital. The columns removed (by Sulla) from the temple of Zeus Olympius at Athens became the model, but the whole Order shows a progressive elaboration in detail with an elimination of plain surfaces combined with inferior workmanship. Examples of this Order are the temples of Mars Ultor and of Castor and Pollux (the latter one of the most beautiful examples in Roman architecture) in Rome, the temple of Vesta at Tivoli, Agrippa's portico to the Pantheon, etc.

The Composite capital is really a Corinthian capital with the dentril at the corner replaced by an Ionic volute. Alternatively it may be regarded as a four-voluted Ionic capital enriched with an acanthus necking. Examples of this capital are to be found on the triumphal arches of Titus and Septimius Severus, the baths of Diocletian, etc.

While the Romans did not abandon the original structural use of the column, its employment as a purely decorative feature became common. It was used in conjunction with the arch; and the skilful combination of these two opposing elements not only exerted a great influence on subsequent architecture but remains the great contribution of Rome to the history of architectural design. The Roman architects themselves never abandoned the traditional idea of supremacy of the Order but its use in the simpler manner of the Greek façade was insufficient to meet the demands of Roman buildings. With the help of the arch the spacing of columns was no longer governed by the load to be carried. This opened up new possibilities in design, and all over Italy and the provinces we see the monumental use of column and arch for triumphal arches from the time of Augustus to that of Constantine, as well as in such buildings as the baths of Caracalla and Diocletian, and the basilica of Maxentius. This naturally led to the development of new details in the shape of pedestals, niches, keystones, etc. Eventually we find arcaded walls without piers, the arch being taken direct on to the column and the entablature run over the arch as an archivolte. Examples of this are in the great Propylæa at Baalbek and in the palace of Diocle-

ROMAN INGENUITY IN THE USE OF LOCAL MATERIALS IS SHOWN BY VARIOUS WAYS OF FACING ROUGH WALLS OF RUBBLE FACED WITH STONE OR BRICK. CONCRETE, BRICK AND TILE WERE SKILLFULLY COMBINED IN VAULTING. THE IMPERIAL FORA, THE PALATINE HILL AND THE PALACE OF DIOCLETIAN ARE INGENUOUSLY COMPOSED. HOUSES AT POMPEII AND TENEMENTS AT OSTIA SHOW THE ADVANCED LIVING CONDITIONS

tian at Spalato.

For buildings of more than one storey the Romans regularly used the Orders above one another. There were four storeys on the Colosseum and seven (we are told) on the Septizium of Septimius Severus on the Palatine.

Temples and Basilicas.—The Roman temples differed in many important respects from those of the Greeks. For the comparatively low stylobate with its three steps all round, the Romans substituted a high platform or podium with a flight of steps on the entrance façade. Again while Greek temples are isolated from other buildings and almost always face east and west, those of the Romans usually face the forum or are placed at the end of a street to close a vista, and are turned to all points of the compass, their orientation being governed by their relation to other buildings. This results in an increased emphasis on the entrance façade with an increased depth to the portico. The *cella* is wider and the colonnade which surrounds the Greek temple is often reduced to a row of engaged columns or pilasters along the *cella* walls except on the entrance front. In some cases the *cella* was vaulted in concrete and might have an apsidal end, e.g., the so called baths of Diana at Nîmes and especially the double temple of Venus in Rome. The best preserved example of a Roman temple now existing is that known as the *Maison Carrée* at Nîmes. In Rome the most important temples of which remains exist are those of Fortuna Virilis, Mars Ultor, Castor and Pollux, Concord and Antoninus and Faustina. Besides these there are in Italy the temple of Minerva at Assisi and the temples at Pompeii, and in Syria the temples of Bacchus at Baalbek and of the Sun at Palmyra, etc.

The most important circular temples are those of Vesta in the Forum, of Mater Matuta and the Pantheon in Rome, the temple of Vesta at Tivoli and those of Jupiter at Spalato, Rome and Augustus on the Acropolis at Athens, and Venus at Baalbek, which has detached Corinthian columns joined to the *cella* walls by a segmental architrave. The greatest circular temple and in many respects the most important Roman building is the Pantheon (*q.v.*). This consists of a rotunda 142 ft. 6 in. in diameter surrounded by concrete walls 20 ft. thick, in which are alternate circular and rectangular niches. Light is admitted through a central opening 28 ft. across, at the crown of the dome. In front is a portico which originally belonged to the temple built by Agrippa and was altered from decastyle (ten columns) to octastyle (eight columns) and re-erected when the rotunda was built under Hadrian, A.D. 120–124. The construction of the rotunda and dome is one of the finest examples of Roman concrete work, the whole being strengthened by immense relieving arches and piers of brick set above one another in the thickness of the walls. The interior was lined with precious marbles, the coffers of the dome were decorated with bronze rosettes and the dome itself covered externally with bronze plates. (See *TEMPLES*.)

The Roman basilicas were large covered halls facing the forum, affording protection from the weather and giving space for the holding of courts of justice and for banking and other commercial transactions—all of which activities had in earlier days been carried on in the open market-place. On the forum in Rome are the Basilica Julia on the south side and the Basilica Aemilia on the north side—both of which had a central hall and side aisles. The Basilica Ulpia in Trajan's forum was similar in plan, but had at either end semicircular halls which served as law courts. The fourth and greatest of the basilicas is that begun by Maxentius and finished by Constantine, A.D. 300–310. This huge building covered 7,000 sq. yd. and followed in construction and plan the great hall of the Roman baths. The vaults over the bays on the north side are still to be seen overhanging without support, a striking testimony to the marvellous cohesion and enduring strength of Roman concrete. The basilica at Pompeii is an example of the simpler type general in the provinces.

Theatres and Amphitheatres.—The Roman theatres differed in several respects from the Greek. The auditorium was not excavated and the walls surrounding stage and seating were continuous, the entrance to the orchestra being by vaulted passages. As the chorus played no part in the Roman theatre the

orchestra or dancing space was not required and became part of the auditorium. The only theatre in Rome of which any remains exist is that of Marcellus built by Augustus (13 B.C.) but there are numerous examples throughout the Roman empire especially in Asia Minor. The theatre at Orange, France, is the best preserved example. Others of importance are the theatre at Taormina, Sicily, two theatres at Pompeii, the theatre at Ostia, the Jdeon of Herodes Atticus at Athens, theatres at Talmessus, Alindé, Aizani, Apendus in Asia Minor, etc.

The Roman amphitheatre (*q.v.*) is in origin, as its name implies, a double theatre. The largest and most important of all the Roman amphitheatres is the Colosseum (*q.v.*) built by the Emperors Vespasian, Titus and Domitian in A.D. 72–80 on the site of Nero's lake. It is a huge ellipse 620 ft. × 513 ft. covering six acres and shows remarkable skill in planning. It had seating accommodation for about 45,000 spectators, and its 80 entrances were so arranged that the whole building could be cleared in an incredibly short time. The whole is built of concrete, the exterior being faced with travertine and the interior with precious marbles that have long since disappeared. Other important amphitheatres are those at Capua, Pompeii, Pozzuoli, Verona, Pola, Arles, Nîmes, etc.

Baths.—By the end of the republic, baths (*balneae*) had become a recognized feature of Roman life. Under the empire their numbers increased until at the beginning of the 4th century A.D. they numbered 1,000 in Rome alone. They were of the type of the Turkish bath with rooms at different temperatures. Remains of these ordinary establishments are common throughout the empire. The Stabian baths at Pompeii are the best preserved.

The imperial *thermae* were more than baths. They were immense establishments of great magnificence with facilities for every gymnastic exercise, with halls to which resorted philosophers, poets and rhetoricians and those who wished to hear them. The earliest of these *thermae* were those built by Agrippa in 21 B.C. Others were built by Nero, Titus, Trajan, Caracalla, Diocletian and Constantine. The best preserved are the baths of Caracalla, which covered an area of 110 yd. square, and those of Diocletian with accommodation for 3,200 bathers. Parts of the latter are now occupied by the church of S. Maria degli Angeli and by the Museo delle Terme. The remains of these two great establishments with their massive walls and great vaults are among the most impressive examples of Roman concrete construction. The planning of the *thermae* is governed by two main principles, that of axial planning, a distinctive feature in all Roman work, and the grouping of all subsidiary halls and rooms round a great central hall. (See *BATHS*.)

Triumphal Arches and Gateways.—More usual than the triumphal column, as exemplified by those of Trajan and Marcus Aurelius, is the triumphal arch commemorating some important event or campaign. This is most commonly an isolated monument not necessarily spanning a roadway; e.g., the triumphal arches of Septimius Severus at Rome and of Trajan at Ancona are accessible only by flights of steps, while the archway itself is too narrow for ordinary use. The triumphal arch was usually decorated with columns and bas-reliefs of the chief events it commemorated and was frequently surmounted by a group of sculpture. The most important of these arches are the arch of Titus (A.D. 82) commemorating the capture of Jerusalem, the arches of Septimius Severus and Constantine in Rome, and Trajan's arches at Beneventum and Ancona. There are several other triumphal arches in the provinces, notably those of Tiberius at Orange, of Augustus at Susa and Caracalla at Tebesa. Others exist at Rheims, Pola, Timgad, Maklar, etc.

The monumental city gate while sometimes serving a commemorative purpose differs from the arch in being part of the defences of the city and meant to be used. Of these one of the most famous and best preserved is the Porta Nigra at Trèves.

Bridges and Aqueducts.—The bridges and aqueducts of the Romans may be treated as monumental works in spite of their utilitarian character. The most famous examples of Roman aqueducts are the Pont du Gard, Nîmes, and the aqueducts at Tarragona and Segovia in Spain. Those which crossed the Campagna

ARCHITECTURE OF ANCIENT ROME

1. View of the Roman Forum, looking toward the Capitol. At the upper left is the Arch of Septimius Severus; to its left, at a slight angle are the remaining ruins of the Temple of Saturn and in front of this the ruins of the Basilica Ulpia, built by Julius Caesar, of which only the column bases remain. Three columns of the Temple of Castor and Pollux remain standing near the centre of the Forum, and in front of these are the ruins of the House of the Vestals. At the left of the picture is a part of the Palatine Hill with remains of buildings of Imperial Rome. 2. The so-called Temple of Fortuna Virilis, in the ancient Forum Boarium, Rome (end of 2nd century B.C.). 3. Drawing attributed to Piranesi of a detail of the

Interior of the Pantheon, originally built by Agrippa in A.D. 27 and re-erected under Hadrian, 120-124. 4. Roman bridge across the Tapis at Alcantara, Spain. 5. Interior of the interior of a Roman Basilica by C. R. Cockerell (1788-1863). 6. The Royal Academy of Arts, 6. Arch of Trajan at Ancone. 7. Interior of the Baths of Arcadia, Roms. 8. Restoration of the Interior of the Baths of Caracalla (see fig. 7). by William Walcott. 9. Roman Temple of Venus at Baalbek, Syria. 10. View of Ostia, the commercial port of ancient Rome. At the lower left are ruins of the ancient Forum and commercial buildings (*horrea*), and beyond these, with a curved wall, the theatre. 11. A street in Ostia.

bringing water to Rome from the hills are also well known and impressive in their decay.

There are not many of the larger Roman bridges now remaining. The best preserved is that built by Augustus and Tiberius at Rimini. The finest is that across the Tagus at Alcantara in Spain.

Tombs.—The larger Roman tombs consisted of an earth mound or tumulus surrounded by a ring of masonry rising usually to a considerable height. Few of these now exist, the most notable being the tomb of Cecilia Metella on the Via Appia and the mausoleum of Hadrian, now the castle of St. Angelo. The smaller tombs, in particular those known as *columbaria* (see *COLUMBARIUM*), are usually underground, though there is sometimes an upper storey, often in the shape of a small temple *in antis*, built of cut brick from which steps lead down to the tomb proper. There is a line of such tombs just outside Rome along the Via Appia and also along the Via Latina. Examples of Roman funeral monuments of various kinds exist along the Street of Tombs at Pompeii and in the provinces, in Syria at Palmyra, Jerusalem and Petra.

Palaces.—By the end of the republican period the Palatine hill had become by far the most desirable residential quarter of Rome. It was therefore natural that the Roman emperors from Augustus onwards should choose to live on it, gradually acquiring further property until the whole hill, except that part halloved by tradition or by the presence of temples, became the imperial residence. Augustus himself bought and enlarged the house known as the House of Livia which still exists. Tiberius built a palace on the north-west side of the hill. Another palace was built on the south-east corner of the hill by Claudius or more probably by Nero. Some rooms of this palace have recently been discovered, though both it and the palace of Tiberius were partially destroyed by fire. The central space was covered by the palace of the Flavians, Domitian with his architect Rabirius being responsible for a magnificent suite of State apartments and for the sunken garden called the *hippodromus*. Hadrian extended the palace towards the forum and the House of the Vestals and finally Septimius Severus raised a huge structure overlooking the Circus Maximus, partly on the top of Hadrian's work and partly on an artificial platform supported on arches and finishing with his Septizimium. Remains of these buildings, often one above the other, cover the Palatine. Of the famous Golden House of Nero on the site now covered by the baths of Titus, the Colosseum and the basilica of Maxentius, very little remains.

The Villa of Hadrian (*q.v.*) at Tivoli, begun about A.D. 123, was another sumptuous imperial residence with parks and gardens on a large scale. There are remains of great brick and concrete structures and the unevenness of the site necessitated large terraces and flights of steps. All the buildings are Roman in style and method of construction, though with Greek names.

The palace of Diocletian at Spalato (Split), to which he retired on his abdication in A.D. 305, combines a palace with a fortress. It consists of an immense rectangle surrounded by walls guarded by towers on three sides and on the fourth to the south protected by the sea. The palace itself is on the south side with a great gallery 520 ft. long with 51 windows overlooking the sea. (See *PALACE*.)

Private Houses.—In the Roman world there were two types of houses, the *domus* and the *insula*. The word *villa* is used to describe an estate complete with house, grounds and subsidiary buildings. Of Roman villas there are very few remains and our chief authority is Pliny who gives a detailed description of his Laurentine villa. Hadrian's villa at Tivoli, an imperial residence, cannot be treated as typical. The *domus* type of house as exemplified at Pompeii (*q.v.*) has long been regarded as the typical Roman house, though in Rome itself very few remains of the *domus* have come to light, the chief examples being the House of the Vestal Virgins on the forum and that of Livia on the Palatine. The *domus* consisted of suites of rooms grouped round a central hall or *atrium*, to which were often added further suites behind grouped round a colonnaded court or *peristyle*. There are few windows on the street, light being obtained from the *atrium* or *peristyle*. The amount of ground required for such a house

while perfectly feasible in a country town such as Pompeii, would have made them beyond the means of all but the richest in a crowded city like Rome. From Latin writers we have long known that there were in Rome great blocks of flats or tenements to which the term *insulae* was applied. Recent excavations at Ostia (*q.v.*) have now revealed the design of these blocks. Planned on three or four floors with strict regard to economy of space they depended for light from the exterior, unlike the *domus* with its central court. Independent apartments had separate entrances with direct access to the street. Since Ostia is a typical town of the 1st and 2nd centuries A.D. and is almost a suburb of Rome itself, it is natural to suppose that *insulae* at Rome would present similar features. (See *HOUSE*.)

Town Planning.—While the Romans have become justly famous for the skillful planning of their towns all over the empire, Rome itself presents a strong contrast with its complete lack of any systematic scheme. For this the natural topography of the site is mainly responsible together with the conditions under which Rome grew into a great city.

The Forum (*q.v.*), the original market place, remained always irregular in plan and was soon far too small for the amount of business transacted in it. The congestion was to some extent relieved by the forums built by Julius Caesar, Augustus, Nero, Vespasian and Trajan. These were all planned on axial lines. Attempts were made to improve the street communications, the most notable being Julius Caesar's widening of the Via Lata, and colonnades and porticoes were built to protect passers-by from the sun and rain. Various emperors also laid down regulations governing the construction and height of buildings. None the less the planning of Rome was a series of expedients without any system, and after each of the fires which successively devastated great parts of the city, Rome grew up again on its old lines, and the evils of its narrow streets, poor drainage and general overcrowding became increasingly difficult to remedy.

The Roman town in the provinces on the other hand is normally planned round a central forum, close to, but separated from, the crossing of the two main roads which ran usually east to west and north to south. Less important roads run at right angles to the main roads. The forum itself is surrounded by a colonnade and facing it are the principal buildings, temples, basilica, senate-house and covered market. The whole is planned in a logical way. The forum at Pompeii may be taken as a typical example.

The layout of a whole town can be most easily seen in some of the towns in north Africa, e.g., Timgad, Tebessa, Thuburbo, where there has been little or no subsequent building to modify the original lines of the plan. (See *TOWN AND CITY PLANNING*. See also *ARCHITECTURE*; *PERIODS OF ART*.)

ROMAN ARMY. In the long life of the ancient Roman army, the most effective and long-lived military institution known to history, we may distinguish four principal stages. (1) In the earliest age of Rome the army was a national or citizen levy such as we find in the beginnings of all states. (2) This grew into the Republican army of conquest, which gradually subdued Italy and the Mediterranean world. A citizen army of infantry, varying in size with the needs of each year, it eventually developed into a mercenary force with long service and professional organization. This became (3) the Imperial army of defence, which developed from a strictly citizen army into one which represented the provinces as well as Italy, and was a garrison rather than a field army. Lastly, (4) the assaults of the Barbarian horsemen compelled both the creation of a field force distinct from the frontier garrisons and

the inclusion of a large mounted element, which soon counted for more than the infantry. The Roman army had been one of foot soldiers; in its latest phase it was marked by that predominance of the horseman which characterized the earlier centuries of the middle ages.

So far as we can follow this long development in its details, it was continuous. So unbroken, indeed, is the growth that many of the military technical terms survived in use from epoch to epoch, unchanged in form though deeply modified in meaning, and ordinary readers often miss the diversity which underlies this seemingly unchanged system. The term *legio*, for example, occurs in all the four stages above outlined. But in each its significance varies. Throughout, it denoted citizen-soldiers; throughout, it denoted also a force which was chiefly, if not wholly, heavy infantry. But the setting of these two constant features varies from age to age. In the first period *legio* was the "levy," the whole host summoned to take the field. In the second period it was not the whole levy, but one of the principal units into which developing organization had divided that levy; the "legion" was now a body of some 5,000 men—the number of "legions" varied with the circumstances, and the army included other troops besides citizens, though they were for the most part unimportant. In the third or Imperial age there were many legions (indeed, a fixed number) quartered in fixed fortresses; there were also other troops, numerous and important, if not yet so formidable as the legionaries. Finally, the legions became smaller units, and the other troops of the army, notably the cavalry, became the real fighting-line of Rome. (See *LEGION*.)

First Stage.—The history of the earliest Roman army is, as one might expect, both ill-recorded and contaminated with much legend and legal fiction. We read of a primitive force of 300 riders and 3,000 foot soldiers, in which the horseman counted for almost everything. But the numbers are clearly artificial and invented, while the pre-eminence accorded to the cavalry has no sequel in later Roman history. We reach firmer ground with the organization ascribed to Servius Tullius. In this system the army included all citizens from 17 to 60 years of age, those under 47 for service in the field, the older men for garrison duty in Rome. The soldiers were grouped at first by their wealth—that is, their ability to provide their own horses, armour, etc.—into cavalry, heavy infantry, a remainder which it would be polite to call light infantry, and some artificers. The heavy infantry counted for most. Armed with long spears and divided into the three orders of *hastati*, *principes* and *triarii* (the origins and real senses of these names are lost), they formed a phalanx, and charged in a mass, while the cavalry protected the wings. The men were enrolled for a year—that is, for the summer campaign; in the autumn, like all primitive armies, they went home.

Second Stage.—From this Servian army a series of changes which we cannot trace in detail produced the Republican army of conquest. Our ancient authorities ascribe the chief reforms to the half-legendary Camillus (q.v.), who introduced the beginnings of pay and long service, improved the armour and weapons, abolished the phalanx and substituted for it an open order based on small subdivisions (*maniples*), each containing two centuries.

Whatever the truth about Camillus, some such reforms must at some time have been carried through, to convert the Servian system into the army which was engaged for nearly three centuries (from 350 B.C.) in conquering Italy and the world. This army broke in succession the stout native soldiers of Italy and the mountaineers of Spain and overthrew the trained Macedonian phalanx. Once only did it fail—against Hannibal. (See *PUNIC WARS*.) But not even Hannibal could out it from entrenchments, and not even his victories could permanently break its *moral*. Much of its strength lay in the same qualities which made the Puritan soldiers of Cromwell terrible—the excellent character of the common soldier, the rigid discipline, the high training. Credit, too, must be given to the genius of Scipio Africanus and to the more commonplace capacities of many fairly able generals. But the organism itself deserves attention, and, as it chances, we know much about it, mainly from Polybius. Its elements were three:—

(A) The principal unit was the legion, generally a division of

4,500 men—3,000 heavy infantry, 1,200 lighter-armed (*velites*), 300 horse—though sometimes including as many as 6,000 men. The heavy infantry were the backbone of the legion. They were levied from the whole body of Roman citizens who had some private means and who had not already served 16 campaigns, and in effect formed a yeoman force. For battle they were divided into 1,200 *hastati*, 1,200 *principes* and 600 *triarii*; all had a large shield, metal helmet, leather cuirass, short Spanish thrusting and cutting sword, and in addition the *hastati* and *principes* each carried two short heavy throwing spears (*pila*), while the *triarii* had ordinary long spears. They were drawn up in three lines: (1) *hastati*, (2) *principes*, (3) *triarii*; the first two were divided into ten maniples each (of 120 men, when the legion only counted 4,500), the third into ten maniples of half the strength. According to the ordinary interpretation of our ancient authorities, the maniples were arranged in a chess-board fashion (*quincunx*), the idea being that the front row of maniples could retire through the intervals in the second row without disordering it, and the second row could similarly advance. The procedure in fighting seems to have been simple: the front line discharged a volley of *pila* and rushed in with the short sword—a sequence much like the volley and bayonet charge of the 18th century—and if this failed, the second line went in turn through the same process; the third line of *triarii*, armed with spear instead of *pilum*, formed a reserve. The *velites*, armed with javelins, came to be used as skirmishers. The cavalry seem to have been of little account—a natural result if, as we have reason to think, the horses were small and stirrups were not used. Scipio Africanus alone developed his cavalry into a decisive instrument.

The officers of the legion consisted of: (a) Six tribunes, in part elected by the comitia, in part appointed by the consuls, and holding command in rotation. They were either veteran officers, sometimes even ex-magistrates, or young noblemen beginning their career. (b) Sixty centurions, each commanding one century, or, rather, a pair commanding each maniple. They were chosen by the tribunes from among the veteran soldiers serving at the time and were arranged in a complicated hierarchy, by means of which a centurion might move upwards till he became *primus pilus*, senior centurion of the first maniple of *triarii*, the chief officer of that rank in the legion. (c) There were also standard-bearers and other under-officers, for whom reference must be made to specialist publications.

(B) Besides the legions, composed of citizens, the Roman army included contingents from the Italian "allies" (*socii*), subjects of Rome. These contingents appear to have been large; in many armies we find as many *socii* as legionaries, but we are ignorant of details. The men were armed and drilled like the legionaries, but they served not in legions but in cohorts, smaller units of 400–500 men, and their conventional positions seem to have been on the wings of the legions. They were principally infantry, but included also a fairly large proportion of cavalry.

(C) Besides legionaries and *socii*, the Roman army included non-Italian troops of special kinds, Balearic slingers, Numidian horsemen, Rhodians, Celtiberians and others: at Trasimene, for example (217 B.C.), the Roman army included 600 Cretan archers. The numbers of these *auxilia* varied; probably they were not numerous till the later days of the Republic.

Composition and Size of Armies in the Second Stage.—According to the general practice, each of the two consuls, if he took the field alone, commanded an army of two legions with appropriate *socii*. If the two consuls combined their forces, commanding the joint force in rotation (as often occurred), the total would be—according to our authorities—four legions, each of 4,200 infantry, the same number of "allied" infantry (in all 33,600 infantry), 1,200 legionary cavalry and about 3,600 "allied" cavalry = 38,400 men. Such, for example, was the Roman army at Trebia (218 B.C.), where (says Polybius) there fought 16,000 legionaries and 20,000 allied infantry. The total number of men in the field could be increased; we even hear of 23 legions serving at one time in the Second Punic War. Just before this war, in 225 B.C., the total man-power of Rome was reckoned at three-quarters of a million, of which about 65,000 were in the field and 55,000 were in a re-

serve at Rome; of the total, 325,000 were Roman citizens and 443,000 (apparently a rough estimate) were allies. The battle order in normal circumstances was simple. In the centre stood the legionary infantry; on each side of that was the allied infantry; on the wings the cavalry. But sometimes the legions were held in reserve and the brunt (and honour) of the fight was left to the allies. Frequently the attack was begun by one wing, as by Caesar at Pharsalus. At Ilipa in Spain Scipio surprised his enemy by a last hour variation of the accustomed order. Putting his Spanish auxiliaries in the centre, his Roman troops on the wings, he "re-fused" his centre and attacked with both wings.

Development from the Second Stage to the Third.—Towards the end of the Republic many changes began to work themselves out in the Roman army. If Camillus began the system of pay and long service, it was effectually developed by long foreign wars in Spain and in the East. Moreover, the growth of Rome as a wealthy state tended to wreck the old theory that every citizen was a soldier, and favoured a division of labour between, e.g., the merchant and the military, while the increasing complexity of war required a longer training and a more professional soldier. In consequence, the old restriction of legionary service to men with some sort of private property was abolished by Marius about 104 B.C. and the legionaries now became wholly proletariat and professionals. By a second change, also connected with the name of Marius, the legion was reorganized as a body of 6,000 men in 60 centuries, divided into ten cohorts instead of (as hitherto) into 30 maniples; the unit of tactical action thus became a body of 600 instead of 120. This was probably an adaptation within the legion of the system of cohorts already in use for the contingents of the *socii*. Soon after, the extension of the Roman franchise to all Italians converted allies and subjects into citizens, and the *socii* into legionaries. A fourth change abolished the legionary cavalry and greatly increased the *auxilia* (C, p. 396).

Third Stage.—The Imperial Army of Defence.—The evils of the Civil Wars (49–31 B.C.) furnished the first emperor, Augustus with both the opportunity and the necessity for reforming the army. Disorganization had reigned for 20 years. It was needful to restore loyalty and system alike. Augustus did this, as he did all his work, by adapting the past: yet there is some truth in the view that his army reforms were his greatest and most original work. The main lines of his work are simple. The Imperial army consisted henceforward of two classes or grades of troops, about equal in numbers if unequal in importance. The first grade was the legions, recruited from Roman citizens, whether resident in Italy or in the provinces. The second grade was formed by the *auxilia*, recruited from the subjects (not the citizens) of the Empire in the provinces, organized in cohorts and *alae* and corresponding somewhat to both the *socii* and the auxiliaries (B, C, above) of the Republican army. There were also in Rome special "household" troops (see *PRÆTORIANS*), and a large body of *vigiles* who were both fire brigade and police.

Details of Troops.—(A) The legion of the Empire was what Marius had left it—6,000 heavy infantry divided into ten cohorts; Augustus added only 120 horsemen to serve as despatch-riders and the like. The supreme command was no longer in the hands of the six tribunes. According to a practice which had sprung up in the latest Republic it was in the hands of a *legatus legionis*, deputy of the general (now of the emperor, commander-in-chief of the whole army) and a man usually of senatorial rank and position. The six tribunes assisted him in theory; in practice they were now little more than young men of good birth learning their business or wasting their time. The real officers of the legion were the 60 centurions, men who (at least in the early Empire) generally rose from the ranks, and who knew their work. The senior centurion, *primus pilus*, was an especially important officer, and on retirement frequently became *praefectus castrorum*, "camp adjutant," or obtained other promotion. Below the centurions were under-officers, standard-bearers, *optiones*, clerks and the like. The men themselves were recruited from the body of Roman citizens (though we may believe that birth-certificates were not always demanded). During the 1st century Italy, and particularly north Italy, provided the bulk of the recruits. After A.D. 70, recruiting in Italy for

the legions practically ceased and men were drawn from the Romanized towns of the provinces. After Hadrian, each province seems to have supplied most of the men for the legion (if any) stationed in it, and so many sons of soldiers born during service (*castrenses*) flocked to the army that a military caste almost grew up. The term of service was, in full, 20 years, at least in theory, but recruiting was voluntary and when men were short discharges were often withheld. On discharge the ex-legionary received a bounty or land: many *coloniae* (municipalities) were established in the provinces by certain emperors for the special purpose of taking discharged veterans—according to a custom of which the first instances occur in the late Republican age. On the whole, the legionary was still the typical "Roman" soldier. If he was no longer Italian, he was generally of citizen birth, and always of citizen rank, and his connection with the Empire and the Government was real. Each legion bore a number and a title (e.g., II. Augusta, III. Gallica). The custom of using such titles and numbers can be detected sporadically in the late Republic, and many titles and numbers then borne by legions passed on into the Empire with the legions themselves. As Augustus gradually became master of the world, he found himself with three armies, his own and those of Lepidus and Antony; from the three he chose certain legions to form his new standing army, and he left these with the titles and numbers which they had previously borne, although that concession resulted in three legions numbered III. and two numbered IV., V., VI. and X. respectively. Similar titles and numbers were given to legions raised afterwards either to fill up gaps caused by disaster or to increase the army.

(B) Besides the legions Augustus developed a new order of *auxilia*. Auxiliaries (as is said above) had served occasionally in the Republican armies since about 250 B.C., and in the later Republic large bodies of them had been enlisted in the armies of contending generals. Thus Caesar in Gaul enrolled a division of native Gauls, free men but not citizens of Rome, which ranked from the first in all but legal status as a legion, the "Alaudae," and in due course was formally admitted to the legionary list (legio V.). But this use of non-citizens had been limited in extent and confined in normal circumstances to special troops such as slingers or bowmen. This casual practice Augustus reduced, or rather extended, to system, following in many details the scheme of the Republican *socii* and velling the novelty under old titles. Henceforward, regiments of infantry (*cohortes*) or cavalry (*alae*), 500 or 1,000 strong, were regularly raised (apparently, by voluntary recruiting) from the non-citizen populations of the provinces and formed a force almost equal in numbers (and ultimately much more than equal) to the legions. The men who served in these units were less well paid and served longer than the legionaries; on their discharge they received a bounty and the Roman franchise for themselves, their wives and children. They were commanded by Roman *praefecti* or *tribuni*, and were no doubt required to understand Roman orders; they must have generally become Romanized and fit for the citizenship, but they were occasionally (at least in the 1st century A.D.) permitted to retain tribal weapons and methods of fighting and to serve under the command of tribal leaders, who were at once their chiefs and Roman officers. These auxiliaries provided both the whole of the archers, etc., and nearly the whole of the cavalry of the army; they also included many foot regiments. A peculiar arrangement (to which no exact parallel seems to occur in any other army) was that a cohort of 500 men might include 380 foot and 120 horse and a cohort of 1,000 men or 760 foot and 240 horse (*cohors equitata*), and an *ala* might similarly include a proportion of foot (*ala peditata*). Each regiment bore a number and a title, the latter often derived from the officer who had raised the corps (*ala Indiana*, raised by one Julius Indus), or, still more often, from the tribe which supplied the first recruits (*cohors VII. Gallorum*, *cohors II. Hispanorum* and the like). To what extent recruiting remained territorial is uncertain; after the 1st century, probably, the territorial names meant in most cases very little.

Composition of Armies and Distribution of Troops in the Third Stage.—If the system of legions and *auxilia* in the early Empire was novel, the use made of them was no less so. The later Repub-

lic offers to the student the spectacle of large field armies, and though it also reveals a counter tendency to assign special legions to special provinces, that tendency is very feeble. Augustus ended the era of large field armies: he could not afford to leave such weapons for future pretenders to the throne. By keeping the Empire within set frontiers, he developed the counter tendency. That policy exactly suited the military position in his time. The early Roman Empire had not to face—like modern empires—the danger of a war with an equal enemy, needing the mobilization of all its national forces. From Augustus till A.D. 250 Rome had no continuous foe from whom to fear invasion. Parthia, her one and dangerous equal, was far away in the East and little able to strike home. Elsewhere, her frontiers bordered more or less wild barbarians, who might often harass, but could not do serious harm. To meet this there was need, not of a strong army concentrated in one or two cantonments, but of many small garrisons scattered along each frontier, with a few stronger fortresses to act as military centres adjacent to these garrisons.

Accordingly, a system grew up under Augustus and his immediate successors whereby the whole army was distributed along the frontiers or in specially disorderly districts (such as north-west Spain) in permanent garrisons. On the actual frontiers and on the chief roads leading to them were numerous cohorts and *alae* of auxiliaries, garrisoning each its own *castrum* of 3-7 acres in extent. Close beside the frontiers, or even on them, were the 25 legions, each (with a few exceptions of early date) holding its own fortress (*castra stativa* or *hiberna*) of 50-60 acres. Details varied at different times. Sometimes, where no Rhine or Danube helped, and where outside enemies were many, the frontier was fortified by a wall of wooden palisades (as in part of Germany; see LIMES GERMANICUS) or of earth or stone (as in Britain, see BRITAIN: Roman), or the boundary might be guarded by a road patrolled from forts planted along it (as in part of Roman Africa). The result was a long frontier guard covering Britain and Europe from the German ocean to the Black sea, and the upper Euphrates valley, and the edge of the Sahara south of Tunis and Algeria and Morocco, while the wide Empire within saw little of its soldiers.

The following table shows the disposition of the legions about A.D. 120 and for many decades subsequently. It would be impossible, even if space allowed, to add the auxiliaries, as the details of their distribution are too little known. But as the number of auxiliaries in any province was probably rather greater than the number of legionaries, the sizes of the various provincial armies can be calculated roughly. Thus Britain was held probably by 35,000-40,000 men. Each provincial army was commanded either by the governor of the province or (in a few exceptional cases) by the senior *legatus* of the legions stationed there:—

Britain	II. Augusta (<i>Isca Silurum</i> , now Caerleon).
"	VI. Victrix (<i>Eboracum</i> , York).
"	XX. Valeria Victrix (<i>Deva</i> , Chester).
Lower Germany (=lower Rhine)	I. Minervia (<i>Bonna</i> , Bonn).
"	XXX. Ulpia Victrix (<i>Vetora</i> , Xanten).
Upper Germany	XXII. Primigenia (<i>Moguntiacum</i> , Mainz).
"	VIII. Augusta (<i>Argentorate</i> , Strassburg).
Pannonia (Danube to Semlin)	X. Gemina (<i>Vindobona</i> , Vienna).
"	XIV. Gemina (<i>Carnuntum</i> , Petronell).
"	I. Adiutrix (<i>Brigetio</i> , near Komorn).
"	II. Adiutrix (<i>Aquincum</i> , near Budapest).
Upper Moesia (Middle Danube)	IV. Flavia (<i>Singidunum</i> , Belgrade).
"	VII. Claudia (<i>Viminacium</i> , Kostolac).
Dacia (now Transylvania)	XIII. Gemina (<i>Apulum</i> , Karlsburg).
Lower Moesia (Lower Danube)	I. Italica (<i>Novae</i> , Slatov).
"	XI. Claudia (<i>Durostorum</i> , Silistria).
"	V. Macedonica (<i>Troesmis</i> , Iglitza).
Asia Minor (Cappadocia) "	XV. Apollinaris (<i>Satala</i> , Armenian frontier).
"	XII. Fulminata (<i>Melitene</i> , on upper Euphrates).
Syria	XVI. Flavia (<i>Samosata</i> , on upper Euphrates).

Syria	IV. Scythica } near Antioch (?).
"	VI. Ferrata } near Antioch (?).
"	III. Gallica } near Antioch (?).
Judea	X. Pretensis (Jerusalem).
Arabia	III. Cyrenica (<i>Bostra</i>).
Egypt	II. Trajana (near Alexandria—a dis- orderly city).
Africa	III. Augusta (<i>Lambesis</i>).
Spain	VII. Gemina (<i>Legio</i> , Leon, in north- west Spain).

The total of legionaries may be put at about 180,000 men, the auxiliaries at about 200,000. If we exclude the "household" troops at Rome, the police fleets on the Mediterranean and the local militia in some districts, we may put the regular army of the Empire at about 400,000 men. This army, as will be plain, was framed on much the same ideas as the British army of the 19th century. It was meant not to fight against a first-class foreign power, but to keep the peace and guard the frontiers of dominions threatened by scattered barbarian raids and risings. Field army there was none, nor any need. If special danger threatened or some special area was to be conquered—such as southern Britain (A.D. 43)—detachments (*vexillationes*) were sent by legions and sometimes also by auxiliaries in adjacent provinces, and a field force was formed sufficient for the moment and the work.

Change from the Third Period to the Fourth.—Two principal causes brought gradual change to the Augustan army. In the first place, the *pax Romana* brought such prosperity to many districts that they ceased to provide sufficient recruits. The Romans, like the British in India, had more and more to look to uncivilized regions and even beyond their borders. Hence comes, in the 2nd century and after, a new class of *numeri* or *cunei* or *vexillationes* who used (like the earlier auxiliaries) their national arms and tactics and imported into the army a more and more non-Roman element. This tendency became very marked in the 3rd century and bore serious fruit at its close. And, secondly, the old days of mere frontier defence were over. The barbarians began to beat on the walls of the Empire as early as A.D. 160: about A.D. 250 they here and there got through, and they came henceforward in ever-growing numbers. Moreover, they came on horseback, bringing new tactics for the Roman infantry to face, and they came in masses. We may doubt if any military system could have permanently stayed this series of human tides. But the Empire did what it could. It enlisted barbarians to fight barbarians, and added freely to the non-Roman elements of the army. It increased the relative strength of its cavalry and began to organize a distinct field force.

Fourth Period.—The results are seen in the reforms of Diocletian and Constantine the Great (A.D. 284-circa 320). New frontier guards, styled *limitanei* or *riparienses*, were established, and the old army was reorganized in field forces which accompanied or might accompany the emperors in war (*comitatenses*, *palatini*). The importance of the legions dwindled; the chief soldiers were the mercenaries, mostly Germans, enlisted from among the barbarians. New titles now appear, and it becomes plain that in many points the new order is not the old. The details of the system are as complicated as all the administrative machinery of that age. Here it is enough to point out that the significance of such officers and titles as the *dux* and the *comes* (duke, count) lies ahead in the history of the middle ages, and not in the past, the history of the Roman army itself.

War Office, General Staff.—Under the Republic we do not find, and indeed should not expect to find, any central body which was especially entrusted with the development of the army system or military finance or military policy in wars. Even under the Empire, however, there was no such organization. The emperor, as commander-in-chief, and his more or less unofficial advisers doubtless decided questions of policy. But the army was so much a group of provincial armies that much was left to the chief officers in each province. Here, as elsewhere in the Empire, we trace a love if not for Home Rule, at least for Devolution. There was, however, a central finance office in Rome for the special purpose of meeting the bounties (or equivalent) due to discharged soldiers. This was established by Augustus in A.D. 6 with the title *acerarium*

ANCIENT ROMAN PORTRAIT SCULPTURE

1. Bronze head of Brutus. An example of the sculpture of the Republican period, dating probably from the 4th century, B.C. In the museum of the Palazzo dei Conservatori, Rome
2. Head of the statue of Augustus found in the Via Labicana, Rome, representing the Emperor Augustus as *pontifex maximus*. In the Museo delle Terme, Rome
3. Colossal bronze head of the Emperor Augustus found in 1911 at Meroe in the Sudan. In the British Museum
4. Sculpture of a lady of the Julio-Claudian period. At Ny Carlsberg, Copenhagen
5. Bronze figure of Hadrian found in the Thames. In the British Museum
6. Lady with a high coiffure, characteristic of portraits of women in the Flavian period (latter half of 1st century A.D.). In the Capitoline Museum, Rome
7. Head of Septimius Severus. In the Stettiner Collection, Rome
8. Head of a statue in armor at Barletta. It has been called a portrait of Theodosius, and also of Heraclius, but is more probably that of Valentinian I. (latter half, 4th century)
9. Head of a young man wearing the athlete's cap. Republican period. In the British Museum
10. Fragment of a Roman-Etruscan relief, representing a group of women looking on at a horse-race. At Ny Carlsberg, Copenhagen
11. Relief representing a group of trumpeters and gladiators. Attributed to the Republican period. In the Glyptothek, Munich
12. Head of Constantine the Great. In the museum of the Palazzo dei Conservatori, Rome

ANCIENT ROMAN RELIEFS AND OTHER SCULPTURES

1. Tombstone of late republican date. In the British Museum. 2. Relief from a sepulchral urn, showing a company of knights preceded by mus-olans, riding toward a small temple. Republican period. In the British Museum. 3. Funeral stela of the republican period. In the British Museum. 4. Statue from Ostia of a young girl represented as Artemis. Imperial period. In the Museo delle Terme, Rome. 5. Mourning woman, a tomb statue of the Antonine period. In the Museo delle Terme, Rome. 6. Roman statue of the Antonine period. In the Palazzo Barberini, Rome. 7. Antinous as Silenus. Relief from the Arch of Constantine, Rome; thought to have belonged to the principate of Trajan and later walled into the arch. 8. Relief from the *Ara Pacis Augustae* (altar of peace) erected by the senate 13-9 B.C. In commemoration of the pacification of the West by Augustus. In the Museo delle Terme, Rome. 9. Relief, probably of the period of Trajan, from one of the belustrades. In the Roman Forum. 10. Relief from an altar believed to have been set up by the Consul Domitius Ahenobarbus (about 30 B.C.). In the Louvre

11. Relief from an altar believed to have been set up by the Consul Domitius Ahenobarbus (about 30 B.C.). In the Louvre

ROMAN FREScoes AND RELIEFS

1. Relief representing an augur taking the auspices. Detail from a frieze
2. Detail of a relief from the Arch of Titus, in the Roman Forum, showing the emperor in the triumphal chariot returning from Jerusalem
3. Detail of the column of Marcus Aurelius, Rome
4. Detail from the column of Trajan, Rome, dedicated in A.D. 113. The various episodes in the emperor's life are linked together in a spiral of 22 turns, to represent a continuous whole
5. Sarcophagus at Melfi, in Apulia, Antonine period (2nd century A.D.). A full-length portrait of the deceased girl is on the lid, and the sides are ornamented with figures symbolic of the soul's destiny
6. Wall-painting from the Roman house discovered in the grounds of the Villa Farnesina, Rome; thought to be possibly as early as the middle of the 1st century B.C. in the Museo delle Terme, Rome
7. Fresco from the series representing a Dionysian initiation, discovered in 1911 in the so-called "Villa of the Mysteries" at Pompeii
8. Septimius Severus and Julia Domna sacrificing. Relief from the gateway of the Silvermiths (Argentarii), Rome
9. Fresco painting of a farm scene; period of the Severi (about A.D. 200). From the Hypogeum (underground chamber) of the Aurelii discovered in 1919 near the Viale Manzoni, Rome
10. Ivory diptych with double portrait of Honorius, about A.D. 406. In the Treasury of the Cathedral, Aosta

MINOR ARTS OF ANCIENT ROME

- 1 and 3. Two silver goblets found in 1922 near Copenhagen, probably the work of the 1st century. They are ornamented with scenes from the Homeric cycle. In Copenhagen
2. Stucco reliefs combined with paintings, from one of the tombs on the Latin Way, Rome. From the 1st or 2nd century
4. Portrait medallion on glass, representing two ladies and a boy, now identified as Alexander Severus at the age of 16 (A.D. 221), with his mother and his grandmother. The medallion was later inserted at the centre-piece of a cross. Now at Brescia
5. Cameo of Claudius. In the Royal Collection at Windsor Castle
6. Fresco of the head of a shepherd playing, said to have been found in a tomb near Rome. In the British Museum
7. Detail of a large mosaic pavement, showing a view of the Nile and its surroundings; perhaps of the 1st century B.C. In the Palazzo Barberini, Palestrina
8. Mosaic of Silvanus, of a fountain niche at Ostia. In the Lateran Museum, Rome
9. The Good Shepherd; fresco of the period of the Severi. From the Hypogeum of the Viale Manzoni, Rome (Pleite II., fig. 9)
10. Wall-painting in a room of the Roman house discovered under the Church of SS. John and Paul, Rome. The subject is the meeting of two divinities (Dionysos and Thetis?) on a sea-girl rock, surrounded by tiny love-gods. One of the largest and best preserved ancient paintings so far discovered in Rome, probably not later than the period of Marcus Aurelius (A.D. 163-180)
11. An example of *opus sectile*, a marble intarsia of various colours, from the basilica of the Consul Junius Bassus, Rome. The subject is the consul riding into the circus surrounded by mounted attendants. About A.D. 331

militaire, and had, for receipts, the yield of two taxes, a 5% legacy duty and a 1% on sales (or perhaps only on auction-sales). The legacy duty did not touch legacies to near relations or legacies of small amount.

ROMAN ART. Modern archaeology has fully vindicated the significance of the Roman output in the field of art; yet the Romans do not, at the outset, present themselves as belonging to that small group of peoples endowed, as it were, with a spontaneous capacity for art, and the impulse to artistic creation latent in their character hardly began to develop before the 4th century B.C. Up to that time such works of art as were produced in, or imported into, Rome were apparently in the main Etruscan or Graeco-Etruscan; and in Rome, as in Latium, Etruscan artists were commissioned to decorate the temples of wood and terracotta which preceded the more sumptuous marble structures of the late republic and the empire. The discovery at Veii in 1917 of a magnificent Apollo in terra-cotta (see ETRURIA) of early 5th century style, satisfactorily confirms the tradition that Volca, an artist from Veii, made the cultus statue of the god for the temple of Jupiter Capitolinus and executed statuary for other Roman temples as well, while from considerations of style and technique the celebrated Capitoline Wolf is now assigned to the same cycle of Veientine art. Etruscan art, though originally dependent for many of its motives and for its technique on Greek models, developed an art of portraiture in which we can from the first trace that naturalism and close attention to detail which afterwards blossomed into the realism characteristic of Rome. The same desire for making permanent the memory of their dead, which led the Etruscans to decorate their funeral urns with a lid in the form of the human head, prompted the Romans to produce waxen masks, or *imagines*, which were preserved in the houses of the Roman aristocracy and were carried in funeral processions of members of the family. The Barberini statue illustrates the custom.

In architecture, too, Roman builders learnt much from their Etruscan neighbours, from whom they borrowed the characteristic form of their temples, and perhaps also the prominent use of the arch and vault. But the stream of Etruscan influence was met by a counter-current from the south, where the Greek colonies in Campania provided a natural channel by which Hellenic ideas reached the Latin race, and, at an early date, Roman architects modified the purely Etruscan type of temple under the influence of western Greek models. Greek modellers in terra-cotta came to Rome (first in 496 B.C., to decorate the temple of Ceres Liber and Libera) and worked by the side of the Etruscans. The conquests of the later republic, however, brought the Romans into more direct contact with the art of Greece proper; victorious generals adorned their triumphs with masterpieces of Greek art, and, when Philhellenism became the ruling fashion at Rome, wealthy connoisseurs formed private collections drawn from the Greek provinces, while Greek craftsmen were employed in the decoration of the palaces of the Roman nobles and capitalists. Every empire-builder—Sulla, Pompey, Caesar—dreamed in turn of modelling Rome on the plan of an Hellenistic city. Even portraiture borrowed an Hellenic character in the time of Caesar and Cicero. Yet this period also saw the beginning of the historical, or, more properly, the commemorative method to whose development the empire gave so powerful an impulse. An early example is afforded by the reliefs representing a Roman sacrifice and other episodes from the life of the army, which adorn the front face of an altar believed to have been set up by Cn. Domitius Ahen-

barbus shortly before 30 B.C. (Plate II., fig. 11).

Augustus enlisted art, as he did literature, in the service of the new order. The technical dexterity which characterizes all forms of art in this period—silver plate and stucco decoration, as well as sculpture in the round or in relief—is largely due to Greek influence; but the form is filled with a new content, the result of a determination on the part of Augustus to shift the centre of artistic activity from Greece to Rome by associating it with new religious and political ideals. But the Roman spirit, after producing in harmony with that of Greece such brilliant results, triumphed once more under Trajan in that novel "epic in stone" with which the column that bears his name is adorned. Along the path thus marked out, Roman art continued to progress, scarcely disturbed by a brief renaissance of classicism under Hadrian. The historical reliefs which survive from the Antonine period, and more especially the sarcophagi, show that the new heaven was at work, though it soon mingled with new influences which brought about radical changes in the whole domain of plastic art. Colour, rather than form, began to take the highest place in the gamut of artistic values. Painting, as recent discoveries show, continued to be practised with conspicuous success; the sister art of mosaic was carried to a high degree of technical perfection; and in sculpture new conventions, such as the plastic rendering of the iris and pupil of the eye, were dictated by the ever-growing need for contrasts of light and shadow. By the close of the 3rd century a further transformation had taken place, which coincided with the political revolution whereby the absolute monarchy of Diocletian succeeded the principate of Augustus. The portraits of Constantine and his house have dropped all traces of naturalism; they are monumental, both in scale and in conception, and their rigid "frontality" carries us back to the primitive art of the East.

Architecture.—For this branch of the subject see ARCHITECTURE; CAPITAL; COLUMN; ORDER; TRIUMPHAL ARCH; here it suffices to note traits which persisted in later Western art. The Etruscans, by modifying the type of the Greek temple, profoundly influenced Roman construction; the Etrusco-Roman temple was not, like the Greek, approached on all sides by a low flight of steps, but raised on a high platform (*podium*) with a staircase in the front; in many instances the cella was square in order to house the divine Etruscan triads (Jupiter, Juno, Minerva; Ceres, Liber, Libera, etc.); and this cella was faced by a deep portico, which often occupied half the platform and thus restored to the outer structure the canonical length of the classic temple. This high *podium* is a first step in the development of building in a vertical direction, whereby, as H. B. Walters remarks, the Romans "paved the way for mediaeval and more particularly Gothic architecture."

The round temple, which originated in the primitive Latin hut, was adopted for the house of the king and for the ancient cults of Vesta and of Hercules. The theme was repeated, with many variations, from the circular temple by the Tiber to those fantastic structures at Baalbek and at Petra which anticipate the innovations of Borromini and the Baroque. For the irregular temple-precincts of the Greeks, the Roman substituted the colonnaded courts, in which—as in the Imperial Fora—the temple was often set against the rear wall (Fora of Augustus, Nerva, Trajan, etc.). This type of enclosure was imitated throughout the Graeco-Roman world—Baalbek (*q.v.*) is a well known instance; from it are derived the forecourts of Christian churches and basilicas, and its inspiration is visible in Bernini's colonnade at St. Peter's.

Another specific achievement of the Roman architect was the application of the arch, the vault and the dome. The rectilinear buildings of the Greeks, with their direct vertical supports, gave place to vaulted structures in which lateral thrust was called into play, a constructional device which was a paramount influence in the Roman architecture of the 17th century. The aesthetic effect of curves was well understood by the Romans; and they were the inventors of those decorative combinations of the Greek orders with the arcade, of which the more famous—the Triumphal Arch and the Arcade order (see ORDER)—had a far-reaching influence. It is impossible, as Rushforth points out, to overlook the analogy between the Arch of Constantine (to take a typical example) and the decorative portals of mediaeval cathedrals, while, at a later

date, the triumphal arch influenced Baroque facades (fountains of Moses and of Trevi) besides being directly imitated in more modern times. Likewise, the superposed arcades adorned with columns or pilasters of a different order on each tier, formed a system of façade decoration which became almost as popular in the Renaissance as it had been in antiquity.

Republican Sculpture.—The art of the republican period may best be studied in its portraiture, where the simple naturalism of the Etruscans gradually makes way for the careful if uncompromising realism of the Romans. Of republican portraiture we have many fine examples, such as the magnificent head—probably of Brutus—which competent authorities now date back to the 4th century, an early date which would account for its partially Etruscan character (Plate I, fig. 1). Somewhat later are the statue of an orator (*Arringatore*) in Florence, in which the Etruscan manner is beginning to yield to the Roman, and the lovely head of a young man wearing the athlete's cap, in the British museum (Plate I, fig. 9). The bronze bust of the actor, Norbanus Sorex, in Naples, is an example of the first quality attributable to the age of the dictator Sulla. Numerous examples in stone or marble are provided by the funeral *stelas*, within which busts, clearly imitated from the wax *imagines*, are stiffly aligned (Plate II, fig. 3); while the more purely Hellenic manner fashionable in the 1st century B.C. may be studied in the well-known heads of Pompey and of Cicero. Apart from portraiture, examples of republican sculpture, both in the round and in relief, are now slowly emerging from oblivion; we may quote the sepulchral urn, lately acquired by the British museum, showing a company of knights, preceded by musicians, riding toward a small temple, in front of which a boy leads a sheep to sacrifice (Plate II, fig. 2). Though the relief retains something of the Etruscan style, subject and spirit are distinctly Roman. The fragment at Ny Carlsberg (Plate I, fig. 10), with a group of women looking on at a mule race, is still more highly Romanized—a crowd being suggested by three or four figures, as in Julio-Claudian art. The well-known slab, in the Museo Mussolini, of Mettius Curtius leaping into the chasm, is presumably copied from an original of republican date, and akin to it is the fine fragment in Munich, recently claimed as republican by C. Weickert, which represents a group of trumpeters and gladiators, one of whom is shown, fallen and crouching, in three-quarters view from the back (Plate I, fig. 11). Again, a circular altar in the Villa Borghese, representing a Roman sacrifice in the presence of Hercules and of Venus Genetrix—ancestress of the Julian house—is, according to the same authority, of republican date and commemorates the *ludi Caesaris* of the year 46 B.C. Another notable example of a Roman altar is the altar of Domitius Ahenobarbus, already referred to (Plate II, fig. 11), in which the historical scene of one face is naively juxtaposed with the "marriage-procession of Poseidon and Amphitrite" represented on the sides; we thus have here the actual event with all its accessories, told in Roman style, while the naval victories and triumphs of the donor are given in the allegorical Greek manner. The same blend of realism and allegory recurs under Augustus in the *Ara Pacis Augustae*, executed between 13 and 9 B.C. in commemoration of the emperor's pacification of the west. This altar stood in a walled enclosure with two entrances, measuring 11½ by 10½ metres. The walls, with their plinth, were about 6 metres in height, and were decorated internally with a frieze of garlands and bucrania, treated with the utmost truth to nature, and externally with two bands of relief, the lower consisting of scrolls of acanthus varied with other floral motives, the upper showing processions passing across the field from east to west; on the south wall Augustus himself with the great officers of state, the flamens and the imperial family; on the north the senators and a crowd of citizens with their children. On the western face, toward which the processions are directed, the "Sacrifice of Aeneas on his arrival in Latium" (Plate II, fig. 9) symbolizes the link between Rome and the ancient Troy. To the east front (apparently) belongs the beautiful group of the earth goddess (Tellus) and the spirits of air and water, allegorical of prosperity and of the fertility of nature under the new rule. The babes that stand in the arms of the Earth Mother and the children that accompany their

elders in the processional friezes introduce a human note which enhances the imperial beneficence. The glorification of empire is the keynote of all Augustan decoration.

Imperial Sculpture.—In the portraiture of Augustus and his successors the Hellenistic manner of the late republic is modified by a return to Etruscan naturalism. This portraiture is well represented by the Prima Porta statue of Augustus, in which he is shown in the attitude of a general addressing his army. Here again we find that the ideal mingles with the real; the emperor is not only bareheaded but barefoot, and the decoration on his corselet symbolizes what his rule has done for Rome and the world, while the tiny Cupid at his side, riding a dolphin, indicates the descent of the Julian house from Venus. The colossal bronze head in the British museum (Plate I, fig. 3), found in 1911 at Merone, in the Suden, belongs doubtless to another notable presentation of the emperor in armour, though we have no clue as to the style of the statue. The Augustus of Via Labicana, on the other hand, discovered in 1909, represents the emperor as pontifex maximus heavily draped, with head veiled, and in the act of sacrificing. The head (Plate I, fig. 2) has a poetic quality which we also find in certain portraits of women, as in the admirable head at Ny Carlsberg (Plate I, fig. 4), but which was unknown to earlier art. The portraiture of private individuals also had interesting developments, and not less so that of women; the charming statue from Ostia of a young girl represented as Artemis, is a good example (Plate II, fig. 4).

The art of the Julio-Claudian period, like that of the republic, is slowly emerging into the light. Among notable Julio-Claudian fragments are the relief from Nola, at Budapest, showing a trumpeter giving the signal for a naval attack (Actium?); certain processional and sacrificial scenes in the Villa Medici, of similar character to those of the Ara Pacis, but later in style, and two reliefs discovered in the Corso only three years ago and removed to the Museo Mussolini, which are attributed to the arch erected to commemorate the conquest of Britain by Claudius in A.D. 44. The more organic relation now attempted between the scenes represented and the background, leads gradually to that pictorial Flavian style best exemplified in the reliefs of the Arch of Titus, which represent the triumph of Titus and the spoils of Jerusalem (Plate III, fig. 2). These are eminently pictorial compositions in respect of depth of focus, and, so far as relief is concerned, the problem of representing form bathed in air and light is here solved. The same effects may be noted in Flavian ornament, as for example in the pilaster from the monument of the Haterii upon which is carved a tall vase, twined with roses that seem swayed by a light breeze. The delicate transitions and the subtle play of light bestow upon the best Flavian portraits the same "illusionistic" quality. New and notable effects were attained by the formal wire-mounted *toupetts* of the ladies; these were used to set off the face, which appears as within a niche—a characteristically Roman effect (Plate I, fig. 6).

But even in the Flavian period we find by the side of the pictorial a more architectonic style, as in the friezes of the Flavian Forum Transitorium, which forms, as it were, the link between Flavian and Trajanic art. To the principate of Trajan belong, it is thought, four slabs of a long battle scene, later walled into the Arch of Constantine (central passage and shorter sides of attics). The composition is fine, the heads of the barbarians full of character, but the atmospheric effects sought by the Flavians are abandoned in these crowded scenes (Plate II, fig. 8). The various episodes were linked together to suggest a continuous whole, a method of composition of which the reliefs of the spiral column put up in Trajan's Forum offer another example. These reliefs, which enfold the column like a strip of embroidery, tell the story of both of Trajan's wars with the Dacians, a formal division between the two narratives being made by a figure of Victory setting up a trophy. Uniform excellence can not be claimed for the reliefs, yet, considering that the column contains 2,500 figures (arranged, it is said, on 400 slabs), the high level maintained is amazing (Plate III, fig. 4). The sacrificial pageants; Trajan's reception of troops; the opening of the bridge over the Danube; the dramatic scene of "the last water ration within the

walls of the enemy's capital, *Sarmizegetusa*," are spirited compositions by a great imaginative artist. The principal character is always the Roman army, and the artist's first intention is to extol its warlike prowess, its courage, its endurance. But the figure of the emperor stands out from the whole and controls the action throughout, thus making manifest in the chief, as in his army, the right of the Roman people.

In the Trajan Column pictorial relief received its death blow; on a carved spiral that mounts in 21 windings up a column of 100 ft. high, precision of outline was imperative and perspectival or atmospheric effects out of the question. We may, however, suppose that the whole was coloured in local tints (brown for the earth, green for the trees, etc.) and that details of armour and horse trappings were added in metal. The column was dedicated in A.D. 113. On the top was a statue of the emperor in gilt bronze, and within the high pedestal, were deposited the golden urns containing Trajan's ashes and those of his consort, Plotina.

In striking contrast to the continuous spiral of the column are the fine reliefs of the arch put up at Benevento (*see TRIUMPHAL ARCH*), in honour of Trajan. The inscription bears the date A.D. 114, but the prominence given in the attica to Hadrian, as well as Hellenizing traits in certain of the sculptures, have led to the supposition that the arch was not finished till after Hadrian's accession. The arrangement of the panels, which summarize Trajan's achievements at home and abroad, is carefully calculated; on the side facing the city the subjects refer to Trajan's policy in Rome; on the side facing the country, to his settlement of the empire. In significance, this arch is the most important monument of Roman commemorative art; each scene, though rounded off and complete in itself, contributing to one dominating idea—the apotheosis of empire. This is consistently worked out from the picturesque relief of the passage way where the beneficent emperor is seen in the midst of grateful citizens, many of whom carry their children shoulder-high, to the grandiose panel of the attica facing towards Rome, where Jupiter offers the thunder-bolt to Trajan as supreme symbol of power, acclaiming him by this act as the *princeps optimus* of the inscription.

With the accession of Hadrian—the "Greekling," as he was called by writers hostile to his policy—a short-lived renaissance of classicism set in, restricted, however, to certain eclectic modifications of Greek statuary which do not fall within our province, and to a change in the relation of background to figures in relief-sculpture. The return to a background, either neutral or with the character of a drop-scene that has no organic connection with the figures, was doubtless responsible for the fact that the historical monuments of this and the following reign often lack the pregnancy of meaning, and vigour of execution, which distinguish those of the Flavian-Trajanic period; mention may be made of three reliefs in the Palazzo dei Conservatori, one of which represents the apotheosis of an empress.

On the other hand, the famous hunting medallions, which were later transferred to the Arch of Constantine are vigorous and interesting compositions, full of the rich and varied incident characteristic of Rome. In portraiture the most important work of this period was the idealized type of Antonine, here represented by the most exquisite of his effigies, which shows him as *Silvanus* (Plate II., fig. 7) and thus invests the favourite of Hadrian with a divinity expressed in the terms of Roman art, as well as a pathos which belongs to his own time. The inscription on the altar gives us the name of Antonianus of Aphrodisias in Caria, one of a family of sculptors domiciled in Rome since the time of Trajan.

The Antonine Period.—This produced in the Marcus Aurelius of the Capitol a type of equestrian statue which has served as model for all subsequent figures of the kind. The poise must have been more perfect in antiquity before the loss of the barbarian that crouched under the horse's right fore-hoof. Here we may note the different manner in which the Trajanic age and that of Hadrian, and his successor, Antoninus Pius, conceived the figures "symbolic of the subject-peoples of the empire. Under Trajan, Roman sculptors had produced the finely realistic statues of Dacian captives which now adorn the Arch of Constantine, while to the period of Antoninus Pius belong the idealized figures,

classical in pose and motive, which adorn the Hadrianum or temple of the deified Hadrian, and of which several are in the Palazzo dei Conservatori.

Under Marcus Aurelius and Commodus, Roman art underwent further transformation. The earliest monument of the time is the base (in the Vatican) of the column (now destroyed) erected in honour of Antoninus Pius and Faustina. The contrast is remarkable between the classicistic representation of the apotheosis of the imperial pair, witnessed by the ideal figures of Roma and the *Campus Martius* (holding an obelisk), and the vigorous realism of the *decursio*, a ceremony performed by detachments of the praetorian guard on horse and foot, in which, with total disregard of perspective as tending only to obscure the action, the artist brings all the figures into the same plane and disposes them on a few projecting ledges of equal size, a device that reappears on the column of Marcus Aurelius. The reliefs of the Aurelian column hardly suffer by comparison with the column of Trajan. We cannot, it is true, trace, as in the earlier instance, the march of events towards a dramatic climax, nor does the artist attempt to produce an impression of a chronological series of happenings. The figures are smaller and more crowded than those of the earlier column, and there is even less regard for perspective than in Trajanic art. Yet a deeper psychology informs the whole; the note of *humanitas* rings clear in the groups of barbarians with their women and children; or in those scenes which centre in the person of the good and philosophic emperor; the monotony of incident is relieved by the sculptor's power of repeating the same idea in a surprising variety of ways. Many episodes are vividly treated, e.g., the famous scene of the fall of rain, ascribed in Christian tradition to the prayers of the "Thundering" Legion, the strong realism of which is in contrast to the idealism of the Hellenistic Jupiter Pluvius in a scene of the Trajan Column.

Contemporary portraiture also shows the invasion of new principles and a tendency to emphasize the contrast between hair and flesh, the face often showing signs of high polish. In the latter half of the 2nd century the contrast is heightened by a new method of treating the hair, which is rendered as a mass of curls deeply undercut and honey-combed with drill-holes; a fine example is the Commodus of the Palazzo dei Conservatori. The aim of the sculptor is to obtain an ornamental effect by the violent contrast of light and dark. This pictorial influence may be seen at work in all branches of sculpture. The sarcophagi of the Antonine and later periods, with their crowded compositions and deep shadows, attain the same effect. A tendency to isolate figures and groups also makes its appearance in Antonine relief, and is strikingly exemplified in the famous *sarcofagi a colonette*, found both in Italy and in Asia Minor, and decorated with figures placed like statues within niches between columns. We may quote as conspicuous examples the sarcophagus of "Homer and the Muses" at Constantinople (from Sidamaria); the fragment of a similar example in the British Museum (Cat. 3,372); the marriage sarcophagus at Florence in the Riccardi Palace, and the grand sarcophagus at Melfi in Apulia. The Melfi example is adorned by figures symbolic of the soul's ultra-mundane destiny and has a full-length portrait of the deceased girl on the lid (Plate III., fig. 5). Many of the statues inserted into the niches of these sarcophagi are considerable works of art and exhibit the same quality of pathos that informs the remarkable tomb-statue, also of the Antonine period, recently discovered near Rome (Plate II., fig. 5). It represents a mourning woman, closely draped and veiled, with strongly individualized features; the splendid movement of the drapery, with the broken rhythm between the hands, preannounces Gothic sculpture and has little or nothing in common with its Greek prototypes.

Later Sculpture.—Under Septimius Severus and his successors, Roman art drifts steadily in its new direction. The reliefs of his arch at the entrance to the Forum represent the emperor's campaigns in the East in a compromise between bird's-eye perspective and the "continuous" style, which, though in sharp opposition to plastic and perspectival laws, has the magnificently decorative effect of Flemish tapestry. Other examples of the art of the period are the reliefs of the little gateway of the

Argentarii in the Velabrum (Plate III, fig. 8) and the relief now in the Palazzo Sacchetti, on which is carved the presentation of Caracalla to the senate as the destined successor of his father.

The political troubles of the 3rd century, the threatened inroads of barbarism, the imminence of economic ruin did not affect the production of art as seriously as might be supposed, nor did they check the continued "progress along the ascending line" of certain of its manifestations. In the portraiture we first become aware of two different currents: the naturalistic in most imperial effigies, e.g., the bronze statue of Severus in Brussels, and the more monumental which invests with a new spiritual dignity the masterly portrait in the Stettiner collection (Plate I, fig. 7). It is conceived in accordance with the laws of frontality, which are still more operative in the grandiose head of an imperial personage (unidentified) from the middle of the 3rd century, found at Ostia (Terme). If we turn to technical methods, we note that the busts of the second quarter of the 3rd century A.D. are distinguished by the treatment of the hair and beard, which seem to have been closely clipped, and are indicated by a multitude of fine chisel strokes on a roughened surface, a technique practised with wonderful effect in the heads of Maximinus the Thracian (A.D. 235-238) in Berlin; of the emperors Papius (A.D. 238) and Philip the Arabian (A.D. 244-249) both in the Vatican; in the remarkable bronze, Balbinus (A.D. 238) of the Vatican library; and in a head of the Capitol (Strong, *Rom. Sc.*, Pl. 127). In these heads the expressiveness is astonishing, the Capitoline head being justly noted for its sly look of craft and cunning. Under Gallienus (A.D. 253-268) there is a momentary return to a greater naturalism, evident in the treatment of hair and beard, and in the emotional look; but in the so-called Probus (A.D. 276-282) of the Capitol, and the Carinus (A.D. 283-285) of the Palazzo dei Conservatori, frontality gets the better of naturalism till it prevails in the portraiture of Constantine (Plate I, fig. 12) and his successors. Organic has been transformed into architectonic structure; the bust (or statue) is no longer a true portrait—a block of marble made to pulsate with the life of the subject represented—but a monument.

In the togate statues of the Constantinian and later period, the deep cutting of the rigid folds contributes to the monumental effect of the figure. Among the finer examples are the two celebrated statues of consuls, in the Conservatori, attributable to the 5th century. By the side of these togate examples a place must be accorded to the statue in armour at Barletta (it has also been called Theodosius and Heraclius, but is more probably Valentinian I.), whose powerful head (Plate I, fig. 8) and splendidly poised body show post-Constantinian art at its best. The narrow bands of relief on the Arch of Constantine, some of which may even date back to the reign of Diocletian, partake of the same monumental character as the single statues of the time. Where the subject permits, as in the reliefs showing Constantine in the Forum and Constantine distributing a dole, the frontality of the central figure and the strict symmetry of the grouping, which imparts an almost geometrical regularity to the main lines of the composition, show that Constantinian reliefs, like the portraits, are calculated for architectonic rather than for plastic effect.

Roman Painting.—The arts whose proper medium is colour enjoyed a popularity with the ancients—Romans and Greeks alike—at least as great as that of sculpture, though, owing to the perishable nature of the material, the record is even more fragmentary. Etruscan painting in Italy reflected, throughout its early history, the phases through which the art passed in Greece. Thus the frescoes which adorn the walls of Etruscan chamber-tombs show an unmistakable analogy with Attic vase-paintings in their neutral background, in the use of conventional flesh-tones, and in the predominant interest shown in line as opposed to colour. This probably was the style of those early wall-paintings at Ardea and Lanuvium, which existed "before the foundation of Rome" (Pliny, *N.H.*, xxv. 18). It is probably also to an early date that we should refer those wall-paintings "in famous temples," of which Quintilian copied the archaic inscriptions, but the first definite mention of painting in Rome is from the close of the 4th century B.C., when we hear of one Fabius

Pictor, who earned his cognomen by decorating the temple of Salus on the Quirinal (302 B.C.). The chief works of specifically Roman painting in republican times (other than the frescoes which adorned the walls of temples) were those exhibited by successful generals on the occasion of a triumph; some idea of these paintings is afforded by the fragment of a fresco in the Museo dei Conservatori, discovered in a sepulchral vault on the Esquiline in 1889, which appears to date from the 3rd century B.C. It represents scenes from a war between the Romans and an enemy who may almost certainly (from their equipment) be identified as Samnites.

We pass from the meagre remains of early Roman painting to the decorative frescoes of Rome, Herculaneum and Pompeii, which introduce us to an art influenced like the contemporary sculpture by Hellenistic models. The scheme of colour is no longer conventional but naturalistic; the picture is concentrated in space, i.e., figures are no longer isolated on a neutral background; difficult effects of linear and aerial perspective are attempted and the modelling of figures is often excellent. It must be premised that this style of wall-decoration was a new thing in the Augustan period. In the Hellenistic age the walls of palaces were veneered with slabs of many-coloured marble (*crustae*); and in humbler dwellings these were imitated in fresco. This "incrustation" style is found in a few houses at Pompeii, such as the Casa di Sallustiana, built in the 2nd century B.C.; but before the fall of the republic it had given place to what is known as the "architectural" style, in which columns and other architectural features are introduced in order to give the illusion of outer space, and this illusion is heightened by the landscape backgrounds, which are often enlivened by figures. An example of such decoration is afforded by the "Odyssey landscapes," discovered on the Esquiline in 1849, amongst the remains of a large private house, attributable at the latest to the period of Claudius. The walls of one room were decorated in their upper portion by pilasters treated in perspective, through which the spectator appears to look out on a continuous background of land and sea, diversified by scenes from the voyage of Odysseus. The artist, it appears, has been mainly interested in the landscape which is sketched with great freedom, but he shows no scientific knowledge of perspective, and commits the natural error of placing the horizon too high. It is clearly to such works as these that Vitruvius refers (vii. 5) when describing paintings which "unfold mythical tales in due order, as well as the battles of Troy or the wanderings of Odysseus through landscapes (*topia*). We should doubtless reckon within the same class those "small scenes from the Homeric cycle within a framework in which blue and gold are predominant" in a room of the beautiful house on the Palatine, identified by Ashby as the *domus transitoria* of Nero, and the numerous examples from the Homeric cycle at Pompeii (cf. especially the series in the "House of the Cryptoporticus" in Insula 6, near the newly-explored Via dell' Abbondanza).

The use of landscape in decoration is stated by Pliny (*N.H.*, xxv. 116) to have become fashionable in Rome in the time of Augustus. He attributes this to a painter named Stidius, who decorated walls with "villas, harbours, landscape gardens, groves, woods, hills, fishponds, canals, rivers, shores" and so forth, diversified with figures of "persons on foot or in boats, approaching the villas by land on donkeys or in carriages, as well as fishers and fowlers, hunters and even vintagers," a description which exactly fits the continuous landscape of the yellow frieze in one room of the house of Augustus (the so-called "house of Livia") on the Palatine. Vitruvius, too, in the passage above quoted, speaks of "harbours, capes, shores, springs, straits, temples, groves, mountains, cattle and herdsmen. . ." Existing paintings—those, for instance, of a columbarium in Villa Doria-Pamfilj, recently transferred to the Terme—fully confirm the statements of ancient writers. In the villa of Livia at Prima Porta the walls of a room are painted in imitation of a park; from the villa of Fannius Synistor at Boscoreale we have a variety of landscapes and perspectives; and in the house discovered at Rome in the grounds of the Villa Farnesina by the Tiber—the paintings of which are in the Museo delle Terme—we find a room decorated

with black panels, upon which landscapes are sketched in with brush-strokes of white.

Figure Painting.—In the architectural style figure-painting on a large scale makes a first appearance. Occasionally it forms an integral part of the design. In the larger "Triclinium" at Boscoreale, for instance, groups and single figures—possibly family portraits—are painted in the wall-spaces between pilasters and columns, while in one room of the "Villa of the Mysteries" at Pompeii, a continuous figure-composition is painted against a paneled background. This wall-painting, which represents a Dionysiac initiation, was discovered in 1911, and may be said to surpass in beauty of colouring and composition anything previously known (Plate III., fig. 7). But figures so arranged as to appear to be moving within the room tend to confine the space. This is contrary to the principles of Roman and Pompeian wall-painting, and a commoner method, therefore, is to concentrate the figure-subject, which is usually of a mythological character, into a central panel clearly marked off from the rest of the wall and intended to be seen as through an opening in the wall. In the architectural style these subjects are usually framed in a species of pavilion or *adnicula*, sometimes painted in perspective, which allows a vista of the landscape beyond (Plate III., fig. 6, from the house of the Farnesina in Rome), but this motive gradually loses its importance in the third style and becomes a purely conventional scheme of decoration, though in the fourth or intricate style, which again reverts to true architectural forms, however fantastic and bewildering in their complexity, the figure subjects are plainly conceived as pictures and framed with a simple band of colour. In the later styles figure-subjects without landscape are extremely common, but it has been shown that, e.g., in the triclinium of the Casa dei Vettii, which is decorated with a cycle of mythological paintings, the lighting is carefully calculated with regard to local conditions, so that the conception of an outlook into external space is not given up. Among Pompeian paintings effects of lighting are at times attempted with great success; for instance the groups of a striking composition—a ceremony of benediction—are executed in bold dashes of colour, especially white, according to the principles of modern impressionism. The subjects of these Pompeian frescoes are for the most part taken from Greek mythology, but this only proves that that source of inspiration was as freely drawn upon in the art as in the literature of imperial Rome. Owing to the total loss of Greek originals, the question how far these were imitated in Pompeii (or Rome) is difficult to determine. The well known Medea, possibly influenced by the painting of Timomachus, may equally well be the contemporary version of an older theme. It would probably be correct to say of such a figure, as of the mourning woman (Plate II., fig. 5), that if the framework is still Greek the spirit is Roman. Figure-subjects are also introduced within frames, directly imitated from actual pictures, and placed on stands, or shuttered like triptychs as in the houses of Livia and of the Farnesina at Rome, and in Pompeii.

Examples of ancient painting in Rome are still scarce, partly because much that has been discovered of late years still awaits publication. But the magnificent series of paintings from the house of the Farnesina, which may be as early as Caesar, since they were found on or near the site of his gardens; the paintings of the house of Livia (architectural style); the famous scene of a ritual marriage known, from its former possessor, as the "Nozze Aldobrandini" (library of Vatican); the decorative ceiling panels from the newly-excavated parts of the Golden House; the lovely head of a shepherd piping, in the British Museum (Plate IV., fig. 6), found, it is said, in a tomb near Rome, show that the art of the capital equalled, or even surpassed that of the buried Campanian cities.

Mention must also be made of the combination of ornamental work in plaster with painting which is found at Pompeii and at Rome, and is a feature of tombs of the 2nd century A.D. In the Augustan period we find exquisitely modelled stucco, used to ornament vaulted ceilings in the "Farnesina" house. An example of Julio-Claudian date is provided by the famous hypogeum of a Pythagorean cult, discovered outside the Porta Maggiore in 1917,

the ceilings and wall of which are entirely covered with reliefs in stucco; and from the principate of Domitian we have the fine stucco work in the cryptoporticus of this emperor's villa at Castel Gandolfo. Painter and modeller also worked in conjunction, with admirable effect; the results are best seen in the tombs on the Latin Way (Plate IV., fig. 2).

Painting continued to flourish under the later emperors. In a room of the Roman house, under the church of SS. John and Paul, may still be seen what is the largest and best preserved ancient painting so far found in Rome (Plate IV., fig. 10); the picture—remarkable for the freshness of colouring, and the beauty of the flesh-tints—can scarcely be later than the period of Marcus Aurelius. The subject is the meeting of the two divinities (Dionysos and Thetis?) on a sea-girt rock amid a joyous escort of tiny love gods, who guide their light craft over sunlit waters. Another room of the same house has decorative paintings of a mystical and religious character. To the period of the Severi may be referred the paintings, discovered near the Monte Mario, in the tomb of the little girl, Otacilia, which represent a "children's paradise," and those wall-paintings in the hypogeum of the Aurelii, discovered in 1919 near the new Viale Manzoni, which apparently reflect the tenets of an heretical Christian sect. Among the Viale Manzoni pictures the one of a farmhouse and its dependencies (Plate III., fig. 9) shows the persistence of the Roman landscape style; that of the Good Shepherd (Plate IV., fig. 9) and the 12 sheep (symbolic of the Sermon on the Mount) is a pastoral in Virgilian vein, while the heads of the 12 figures identified as the Apostles, recall heads on the column of Marcus Aurelius. Sound Roman traditions were still operative under Aurelian, as we see from the tomb of Treburius Justus, with its picture of the building of a city-wall, and the portraits of the occupant of the tomb and his family, treated in a style of art which persists in the Christian catacombs. The fact that painting was still vigorous in Rome under Constantine is evident from the magnificent figure of Roma found on the site of the old Lateran palace and assigned by Wilpert to a group of the imperial family attended by allegorical figures and divinities.

Portrait Painting.—From the few examples still extant we may assume that portrait-painting was of the same excellence as portrait-sculpture: the group of Terentius Neo (long mistaken for Paquius Proculus) and his wife at Naples, from Pompeii, is characteristic of the Augustan period, to which we may doubtless likewise refer the original of the fine mosaic representing the poet Virgil between two muses. Portraits of poets were a common feature of book-illustration, and the poet Martial (XIV. 186) mentions a portrait of Virgil prefixed to an edition of the *Aeneid*. The celebrated portraits in "encaustic" from the Fayum, give us a series of examples from the Flavian period to the 3rd century. These paintings were executed in wax—the usual technique of portrait painting, in which the colours were mixed with liquefied wax and fixed by heat, whether in a molten state or not is uncertain, though it seems more likely that the pigments were laid on cold and a hot instrument used afterwards. These tablets have been found exclusively in Egypt, where they were inserted into the mummy-case in place of the older plastic masks. Excellent examples of portrait-painting are provided by the medallions on gold glass, which have something of the value of our modern miniatures. One of the finest is in the Museum of Arezzo; it may be attributed to the period of Marcus Aurelius, and represents a bearded man whose delicate features are drawn with the utmost subtlety on a blue ground (flesh on gold, with details in black, drapery silver with violet streaks). Another little masterpiece, later inserted as centrepiece of a cross now at Brescia (Plate IV., fig. 4) represents two ladies and a boy, now identified as Alexander Severus, in the year of his accession (A.D. 211) when he was only 16, with his mother, Mamaea, and his grandmother, Naesa.

Roman Book-illustration.—See ILLUMINATED MANUSCRIPTS. This was a highly-developed branch of art in Rome, as appears from the description of Varro's 15 books of *Imagines*, illustrated with 700 pictures, and from the passage in Martial already referred to. The extant material, however, is mostly later than the period

we are concerned with. But the famous illustrations to a 4th century codex of the *Iliad*, in the Ambrosiana at Milan, reflect, according to Wickhoff, the Romano-Pompeian style, while the illustrations of the Vatican Virgil, No. 3,235, seem to be 4th century copies of pictures of Augustan date. On the other hand, the pictures in the 4th century Virgil (Vat. 3,867), notably the "Assembly of the Gods," are in the contemporary "frontal" style here illustrated by the Junius Bassus panel in *opus sectile* (Plate IV, fig. 11). Roman influence inspires the celebrated Diocorides of Vienna of the year 512, the style of which is closely akin to that of the Vienna Genesis, and is still vital in the 10th century in the Joshua rotulus of the Vatican, many of whose pictures clearly depend upon Roman his oric relief.

MOSAIC

The gaps in the available knowledge of Roman painting can be filled up to a certain extent by what we learn from the remains of the sister art of mosaic, which, being less easily destroyed, have survived in thousands to the present day (see MOSAIC). The Roman artists were, generally speaking, alive to the essential differences of principle between the arts, and did not seek to produce the impression of painting, executed with a liquid medium, by the use of solid materials. Amongst the mosaics of Roman date which employ a large number of exceedingly minute cubes, an illusion akin to that of painting seems, it is true, to be the aim, though even here the Roman mosaicist never entirely transcends the limits imposed by his material. The most conspicuous examples of this more naturalistic manner are the pavement in the Lateran museum signed by the Greek Hieracitus, which appears to reproduce the "unswept hall" of Sosos of Pergamum (see MOSAIC), and the mosaic of the doves from Hadrian's villa, preserved in the Capitoline museum, inspired by the "Drinking Dove" of the same artist. The former of these contains about 120, the latter as many as 160 cubes to the square inch.

A distinction must be drawn between *opus tessellatum*, consisting of cubes regularly disposed in geometrical patterns, and *opus vermiculatum* in which a picture is produced by means of cubes irregularly placed. The two methods were commonly used in conjunction by the Romans, who recognized that a pavement should emphasize the form of the room to which it belonged by means of a geometrical border, while figure-subjects should be reserved for the central space. The celebrated pavement at Palestrina (Plate IV, fig. 7), with an extensive view of the Nile and its surroundings, is possibly the earliest known Roman picture in mosaic. Though it can scarcely be dated to Sulla's restoration of the Praenestine temple, it cannot be later than the second half of the 1st century, and seems early Augustan both in its Egyptianizing subject and in its landscape motives. Small mosaic-pictures isolated in geometrical pavements were called *emblemata*, and were often transported from the great centres of production to distant provinces, where pavements were prepared for their reception. The subjects of these *emblemata*, like those of the wall-paintings of Pompeii, were taken frequently from Greek mythology, and it is not easy to determine what degree of originality is to be assigned to Roman artists. We note a certain interest in the great figures of literature and philosophy. A subject commonly known as "The Academy of Plato" shows us a group of Greek philosophers engaged in discussion. In provincial pavements it is not uncommon to find portraits of poets or philosophers used to fill ornamental schemes of decoration, as in the famous mosaic at Trier signed by Monnus. The portrait mosaic of Virgil, mentioned on p. 401 discovered in a villa at Sousse in Tunisia (ancient Hadrumetum) shows a marked new interest in Roman literature, while it has also been shown that the mythological scenes depicted by the mosaic-workers of the later imperial period are frequently inspired, not by Greek poetry or even Greek artistic tradition, but by the works of Ovid; and the popularity of the legend of Cupid and Psyche is, doubtless, to be traced to its literary treatment by Apuleius. Besides a well-chosen repertory of geometrical patterns, the mosaic-workers make use of vegetable motives taken from the vine, the olive, the acanthus or the ivy, as well as traditional figures, such as the seasons, the winds, the months and

allegorical figures of all kinds, forming elements in a scheme of decoration which, though often of great richness, is never lacking in symmetry and sobriety. Mosaic pavements were a common luxury in the provinces, those of Gaul and of Roman Africa being specially celebrated; and there are fine examples from both Africa and Roman Britain in the British Museum.

Wall and ceiling mosaics from the classical period are rare. What appears to be the earliest example in Italy was identified in 1928 by G. Lugli at the villa of Hadrian. It is a floral-geometric design in black on a white ground of marble tesserae veined with a vitreous blue paste, which adorned the vaulted ceiling of a house of republican date, afterwards transformed by Hadrian into the imperial residence. Another example of the 2nd century A.D., first noted by Ashby (*P.B.S.R.*, iii, 1906, p. 104) is afforded by a circular domed nymphaeum near the Via Tiburtina, which is entirely covered with a mosaic of plain white tesserae. But the destruction, partial or complete, of the imperial thermae and palaces has deprived us of the more elaborate means of passing judgment on the systems of *opus musivum* proper (see MOSAIC), i.e., the decoration of vaults and wall-surfaces with mosaics in glass, enamel or precious materials. We can, however, form some idea of these from the decoration of fountains at Pompeii and elsewhere, as well as from the compositions which adorn the walls and apses of early Christian basilicas. The mosaic on blue ground of the god Silvanus, on a fountain niche from Ostia at the Lateran (Plate IV, fig. 8), shows a type of decoration whence derive the apsidal compositions of S. Pudenziana or of SS. Cosma and Damiano. On the other hand, the celebrated groups of Justinian and Theodora with their courts, in S. Vitale at Ravenna, continue the series of those imperial groups of which the families of Maximian and of Constantine Chlorus, painted in a hall of the palace of Aquileia, afforded a noted and celebrated example. The "Roma Barberini" comes, as we have seen, from a similar group in Rome, and the Theodosius, with his sons and officers of State, on the silver plate in Madrid probably reproduced yet another. Further fine and instructive examples of *opus musivum* may be studied at S. Costanza in Rome, built by Constantine early in the 4th century A.D. The mosaics of the cupola were destroyed in the 16th century, but those of the annular vault which surrounds the baptistry, though much restored, show that the decorative schemes of Eroses, vine-patterns, medallions, etc., commonly found in pavements were also used by the *musivarii*.

When employed in the service of Christianity the old pagan themes were invested with a new spiritual meaning, and mosaic became the chief channel through which motives invented by paganism were transmitted to Christian art. The acanthus decoration in green and gold on blue ground in the baptistry of S. John Lateran continues the floral arabesques of the Ara Pacis, and similar scrolls form the background of the *arbor vitae* at St. Clemente (time of Pope Paschal II., 1099-1118), and frame the central group of the apse mosaic at S. Maria Maggiore (time of Nicholas IV., 1288-92). In other mosaics we find the pagan river motive, with pleasure boats floating down stream and boys angling from the bank, to symbolize the river Jordan or the rivers of paradise.

Opus sectile, a marble intarsia of various colours, also deserves to be noted. An interesting example in Palazzo Colonna, possibly as early as the 1st century, represents the "Infancy of Romulus and Remus"; another, attributable to the 4th century, is provided by the magnificent, though sadly scattered remains of the revetments in marble and mosaic of the basilica of Junius Bassus (consul, A.D. 331) on the Esquiline. They are remarkable for brilliancy of colouring and for the magnificent frontal composition of certain of the panels; the one chosen for illustration (Plate IV, fig. 11), which represents the consul himself riding into the circus surrounded by mounted attendants, has the same pictorial quality (the same absence, for instance, of ground line), as the Ravenna mosaics of Justinian and Theodora.

PRECIOUS METALS AND BRONZE FURNITURE

For the history of plate see SILVERSMITHS' AND GOLDSMITHS' WORK. Pliny's lament (*N.H.* xxxiii, 154 sqq.) that silver chasing was, in his time, a lost art, is mere rhetoric and is disposed of

by the list he gives in an earlier chapter (xxxiii, 139) of the principal ateliers in which such work was produced in his time, as well as by the numerous surviving examples of Roman plate. Of the utmost significance is the treasury discovered at Boscoreale (now in the Louvre), which contains pieces ranging from the age of Caesar to that of the Flavians. Many of the subjects are specifically Roman, like those of the pair of cups representing the triumphs of Augustus and Tiberius. A Julio-Claudian cup in Vienna, from Aquileia, shows in the same way as the corselet of the Augustus of Prima Porta, the benefits ensuing from the imperial rule. Other notable 1st century examples may be seen in Naples. Roman plate travelled far and wide and excellent examples have been found at Berthouville in Normandy, at Hildesheim in Germany, and even in Denmark. The two goblets found in 1922 near Copenhagen (Plate IV, figs. 1 and 3), reproduce scenes from the Homeric cycle (ransoming of Hector and myth of Philoctetes) so popular among the Romans. The artist, who signs himself Cheirisophos, was probably a Campanian Greek in the service of Roman employers. The gold patera with Dionysiac subjects (from Rennes, in the Cabinet des Médailles) shows the vitality of the art under Septimius Severus, and that it continued to flourish long after it attested by the silver disc of Theodosius at Madrid, and of Valentinian at Geneva.

Bronze furniture, too, was often of great beauty, and among pieces that deserve at least a mention are the *lectica* or litter of Augustan date in the Museo del Conservatorio; the couch with silver inlay in the same collection; the graceful tripod-stand at Naples, the tray of which is wrought with garlands in the style of the Ara Pacis; while the so-called Tensa Capitolina, with its rich bands of decoration and portrait medallions, is a notable example from the 3rd century A.D.

ENGRAVING AND MINOR ARTS

By far the greater part of the ancient gems which exist in the modern collections belong to the Roman period, and the great popularity of gem-engraving amongst the Romans is shown by the enormous number of imitative works, cast in coloured glass paste, which reproduce the subjects represented in more precious materials. In the Roman *intagli* we can trace the various phases of Roman plate art. A black agate in the Hague museum (Fürst-wangler, *Die Antiken Gemmen*, pl. xviii. 13), supplies a characteristic portrait of the Ciceronian age. The splendid cornelian which has passed from the Tyskiewicz collection at Boston (inscribed ΠΟΠΙΑ [for Popilia], AABAN [for Albanus], the names of two Roman families), which portrays Augustus, in the guise of Poseidon, in a chariot drawn by four hippocamps, should, doubtless, be referred to the victory of Actium. A sardonyx in Florence (Fürst-wangler, *op. cit.*, pl. lix. 11) portrays an empress of the Julio-Claudian line as Hera. Flavian portraiture is seen at its best in the aquamarine in the Cabinet des Médailles signed by Euhodos, which represents Julia, the daughter of Titus. Amongst later gems one of the finest is the "Hunt of Commodus" in the Cabinet des Médailles, engraved in a stone popular with Roman artists—the "nicolo," a sardonyx with a bluish-grey upper layer used as background, and a dark brown under layer in which the design is cut. But the masterpieces of Roman gem-cutting are to be found in the great cameos, cut in various materials, including single coloured stones such as amethyst or chalcedony, though the stone most fitted by nature for this branch of art was the sardonyx in its two chief varieties—the Indian, distinguished by the warmth and lustre of its tones, and the Arabian, with a more subdued scale of colour. Two masterpieces survive in the "Grand Camée de France" (cab. des Antiques, Paris), a magnificent Indian sardonyx in five layers representing the apotheosis of the Julio-Claudian house, and the "Gemma Augustea," an Arabian sardonyx which shows Augustus and Roma enthroned, receiving a victorious prince, while in a lower zone are groups of captives and Roman soldiers. Other examples of the first order are the cameo of Augustus from the Strozzi and Blacas collections, now in the British Museum, the cameo of Claudius in the collection at Windsor (Plate IV, fig. 5); the busts of the same emperor and of three members of his family set on cornucopias, at Vienna.

Engraved gems are not the only examples of Roman work in precious metals. Amongst the portraits of the first dynasty none are finer than the small head of Agrippina the younger in the British Museum in *plasma* (root-of-emerald), and the lovely head of Tiberius in turquoise, acquired by the British Museum during the World War, from a soldier, who found it in Egypt. Vases, again, were carved in precious stones, such as the famous onyx vase at Brunswick (Fürst-wangler, *op. cit.*, figs. 185-88) with reliefs relating to the mysteries of Eleusis, and the smaller, but finer, onyx vase in the Berlin museum (Fürst-wangler, *op. cit.*, figs. 183-184), representing the lustration or baptism of a prince of the Julian line—a rock surmounted by a small temple recalls one slab of the Ara Pacis, and the work seems of Augustan date.

As mentioned before, coloured glass was used as a substitute for gems, and it is to the school which produced the cameos of the early empire that we owe the vases in white and blue glass of which the Portland vase in the British Museum is a famous example. Pompeii furnishes a second in the amphora, decorated with vintage scenes, in the Naples museum.

We must also class amongst the fine arts that of the die-sinker. Not only are the imperial portraits found on coins worthy of a place beside the works of the sculptor, but in the medallions of the 2nd and 3rd century A.D. we find figure-subjects, often recalling those of contemporary reliefs, treated with the utmost delicacy and finish. Later lead medallions often reproduce landscape motives and actual views; e.g., medal of Diocletian, in Paris, with view of a city, its river and bridge; medal of Constantius Chlorus, found in 1922 near Arras, with the Thames and the port of London; medal of Constantine with the famous gate of Trier. The fine bronze medallion of Valens and Valentinian, enthroned side by side in frontal pose, shows that the art of the medallist was still vital in the 4th century A.D.

Ivory was a favourite material with the Romans, as it had been with the Etruscans. It was worked both in the round and in relief and often used for the adornment of furniture. A head of 1st century date—probably Augustus—in the Stroganoff collection, and another representing a personage of mid 3rd century date, in the British Museum, rank with the best Roman portraiture. The series of consular and other diptychs are discussed in a special article (DIPTYCH). Among them are masterpieces like the magnificent Symmachorum-Nicomachorum diptych, one leaf of which is in the Victoria and Albert Museum and the other in the Cluny Museum at Paris. Diptychs also largely helped to keep portraiture alive; fine examples of this type are the diptych of Probus at Aosta with the double portrait of Honorius (Plate III, fig. 10); that of Felix, of the year A.D. 428, in Paris and that of Boethius, consul in A.D. 487, in the museum of Brescia.

Of the purely industrial arts it is unnecessary to speak at length. In the last century of the republic a flourishing manufacture of red-glazed pottery was established, with its chief centre at Arretium (Arezzo); the signatures of the vases enable us to distinguish a number of workshops owned by Romans who employed Greek or oriental workmen. The repertory of decorative types reflects the cross-currents of classicism and naturalism which were contending in later Hellenistic art. In the 1st century A.D. the Italian fabrics were gradually driven out of the market by those of Gaul, where the industry took root in the Cevennes and the valleys of the Rhône and the Allier; and before long north-eastern Gaul and the Rhineland became centres of production in the various minor arts, which continued to flourish until the breakdown of the imperial system in the 3rd and 4th centuries A.D. Glass, though made in quantities for the Roman market, was usually of foreign manufacture, probably Syrian. The subject is fully treated in Kisa, *Das Glas im Altertum*.

With only limited space at our disposal, we have confined ourselves in the above section to monuments in Rome, only going outside the capital for examples of exceptional importance. The products of local or provincial art and the special problems which they raise cannot be treated here, though some clue to the literature of the subject will be found in the bibliography. The Museo del Impero Romano affords a well-arranged survey of Roman provincial art; it contains, along with much that is new, most of

the objects from the Exhibition of the Roman Provinces held in the Baths of Diocletian in 1917, an account of which by E. Strong appeared in the 1st volume of the *Journal of Roman Studies*.

SUMMARY

It may be said that as the establishment of the Roman empire gave a political unity to the ancient world, and acceptance of Christianity by its rulers assured the triumph of a universal religion, so the growth of a Graeco-Roman nationality, due to the freedom of intercourse between the subjects of the emperors, led to a unity of culture which found expression in the art of the time. Yet no sooner was the fusion of the elements which contributed to the new culture complete than the process of disruption began, which issued in the final separation of the Eastern from the Western empire. In the first, the oriental factors, which produced a gradual transformation in Graeco-Roman art, definitely triumphed; and the result is seen in Byzantine art. But in the West it was otherwise. The realism native to Italy remained alive in spite of the conventions imposed upon it; the human interest asserted itself against the decorative. Therefore, the Christian art of the West is the true heir of the Roman, and, through the Roman, of the classical tradition. As we have seen, Roman art in its specific aspect was an historical art; and it was for this reason eminently fitted for the service of an historical religion. The earliest Christian art whose remains are preserved is that of the catacombs; but though not devoid of technical merit (on this point see A. della Seta, *Religion and Art*, p. 337 seq.) this art is dominated by the single idea of deliverance from the grave and its terrors, whether this be conveyed by scriptural types or by representations of paradise and its dwellers. Not until the Church's triumph was complete could she command the services of the highest art and unfold her sacred story on the walls of her basilicas; but, when the time came, the monumental art created by the demands of imperial majesty was ready to pass into the service of Christianity.

It remains to note that the scientific study of ancient Roman art dates from a comparatively recent period. The great artists of the Renaissance, headed by Raphael and Michelangelo, showed no lack of appreciation for such models as the reliefs of Trajan's Column; and Mantegna's "Triumph of Caesar" vividly suggests how great was the influence exerted by Roman historical sculpture upon their choice and treatment of monumental subjects; but their eyes were already fixed on the Greek ideal, however imperfectly represented by the monuments then available. In the 18th century the supremacy of this standard seemed established beyond challenge, and even the vision of the *Magnificenza Romana*, evoked by Piranesi, failed to arouse any response in Winckelmann and the apologists of Greece. The Greek antique, till then only dimly divined behind the copies that filled the palaces and galleries of Italy, was soon to be made more vivid by the recovery of the buried treasures of Herculaneum and Pompeii and the systematic excavation of the extant remains of Hellenic art, which began early in the 19th century and still continues, not unnaturally absorbed the attention of the majority of classical archaeologists. Nevertheless, towards the close of the 19th century, when the main lines of Greek artistic development had been traced and interest aroused in its later offshoots, critics were led to examine more closely the products of the Roman period. In 1893, Alois Riegl entered the lists on behalf of Roman Art with his *Stilfragen*, a series of essays on the history of ornament, in one of which he expressed the opinion that "there was in the antique art of the Roman empire a development along the ascending line and not merely a decadence, as is universally believed." This thesis was taken up two years later by Franz Wickhoff in a preface to the reproduction in facsimile of the illustrated ms. of Genesis in the imperial library at Vienna.

In the year following the English translation (by E. Strong) of Wickhoff's work, Riegl published the first (which, by reason of its untimely death, remained the only) volume of his *Roman Industrial Art* (new ed., 1927) in which he endeavoured to show that the later transformations of Roman art in the 2nd and succeeding centuries after Christ continue to mark a definite

advance. The fecundity of the leading ideas put forward by Wickhoff and Riegl remains unimpaired, as Koch points out, in spite of the attacks of Josef Strzygowski, who for 30 years and more has never ceased to dispute the originality of Roman art and to insist that Roman artistic achievement, whether of the imperial or early Christian period, was at all times dependant on the Hellenistic East. By thus shifting the ground of controversy from the Mediterranean to the oriental area, Strzygowski, again to quote Koch, has immeasurably broadened the archaeological horizon; but the net result of the long conflict, so far as our enquiry is concerned, has been to bring out more clearly the essential characteristics of Roman art in the pre-Christian period, and its high significance in the formation of the art of the Christian West. The case for Roman art is stated anew by G. McN. Rushforth in the chapter "Roman Art and Architecture," contributed to the *Legacy of Rome* (1923) and by Herbert Koch in the admirable monograph, *Römische Kunst* (1925), already quoted. It will be seen from what has been said above that there is a new and growing interest in the post-Constantinian periods of Roman art, down to Justinian and later. Of this we have the proof, not only in Riegl's book quoted above, but also in Delbrück's magnificent publication of late Roman monuments—done by care of the German Institute—and in all the newer histories of ancient art—Rodenwaldt's for instance.

Instituts* (with its *Denkmäler*). (H. S.-J.; E. So.)

ROMAN CATHOLIC CHURCH. The word "ecclesia" appears in the New Testament 126 times: twice in its ordinary

Greek sense of the assembly of the city-state of Ephesus, once of the community of the Israelites at Sinai and on all other occasions of the society or Church of Christ, whose members were called Christians first at Antioch. St. Paul uses the word both of local societies, "churches" of Judea, Asia, Galatia, Macedonia, the Thessalonians or in Philomén's house (as he speaks of "them of Laodicea"), and also of the "whole Church of God." In Matt. xvi, 18, Christ answers St. Peter's confession, "Thou art Christ, the Son of the living God," by saying "Thou art Peter; and upon this rock I will build my church." In Matt. xviii, 15-20, He defines what may be called ecclesiastical jurisdiction: "If thy brother shall offend against thee . . . tell the church. And if he will not hear the church, let him be to thee as the heathen and publican. . . . Whatsoever you shall bind upon earth, shall be bound also in heaven; and whatsoever you shall loose upon earth, shall be loosed also in heaven. Again I say to you, if that two of you shall consent upon earth, concerning anything whatsoever they shall ask, it shall be done to them by my Father who is in Heaven. For where there are two or three gathered together in my name, there am I in the midst of them." The most mature and conscious definition of the Apostolic Church is contained in the Epistles to the Ephesians and Colossians: ". . . the Kingdom of the Son of His love; in whom we have our redemption, the forgiveness of our sins; who is the image of the invisible God, the firstborn of all creation; for in Him were all things created in the heavens and upon the earth . . . all things have been created through Him and unto Him; and He is before all things and in Him all things consist. And He is the head of the Body, the Church." (Col. i, 13-18). "To sum up all things in Christ . . . and He put all things in subjection under His feet and gave Him to be head over all things to the Church which is His Body, the fullness of Him that filleth all in all" (Eph. i, 10, 22-23).

This organic unity of Christ, "the fulness of the godhead bodily," with the church "which is his body" is the essence of Catholic ecclesiology. In Christ, the godhead assumed human nature: the nature of man is united in Christ with the nature of God, and the church is therefore the divine organism. But the nature of man implies a historical and instituted existence on earth. "By the very fact of being a body," said Leo XIII, "the church is visible." Its existence, institution and operation are therefore sacramental. It is the mystery of the incarnate godhead perpetually realized and available in all time and for all the purpose of the divine incarnation. There can be but one such church and, as it is historical and instituted on earth, there can be but one church visible on earth. As it is divine as well as human, it contains and consummates the whole divine creation, "the Church triumphant, the Church suffering and the Church militant, and is the fulness [pleroma] of Him that filleth all in all." Hence it is holy and catholic. Its institution is simultaneously divine and human. Historically and therefore upon the authority of its divine Founder, this church is the church of His apostles. It is apostolic and its apostolicity is its perpetual attribute. Within the compass of its sacramental purpose it is infallible, in the sphere of faith (i.e., man's apprehension of God) and in the sphere of morals (i.e., man's essential relation with God and man). This infallible authority is not to be confounded in any sense with "power": it is the infallible authority of knowledge which is of the essence of the union of man with God—knowledge not achieved as in the natural sciences externally by observation, hypothesis and experiment, but inherent and essential as God knows Himself and His creature and the nature of the unity which He wills and accomplishes. The effectual operation of this entire sacrament, the vital activity of the divine organism, is known as grace.

Grace is the universal operation of the church. It is the initiation, process and fulfilment of the divine activity of redemption by which God unites His creatures organically with Himself and endows them thus with His own vitality. This universal grace or sacrament is effectually realized and defined in seven sacraments, acts of God in and through the divine organism by which the divine life is bestowed and the organic union is accomplished and sustained. In the Eucharist "under the appearances of bread and

wine, Jesus Christ Himself is contained, offered and received." It is the whole act of redemption, the sacrifice—that is, the making holy—of the whole universe in the person of Christ, "the most divine gift emanating from the depth of the heart of the Redeemer 'with desire desiring' this wonderful union with men which was especially designed to spread everywhere the life-giving fruit of His redemptive work" (Leo XIII, encyclical *Mirae caritatis*, 1902). Baptism is the initial reception of the human being into the body of Christ. Confirmation given to members of an age to recognize and will their membership is the sacrament of moral maturity. Marriage is the sacrament which sustains in Christ human generation and family life. Penance restores the union with God when it has been injured or broken by sin. Order creates and sustains the whole institution of priesthood and episcopacy by which the divine organism lives and functions on earth. Thus the penitent confesses his sin to Christ, who hears, judges and absolves him by means of the human priest, and the sacrifice of Calvary is contemporary with all times as the same sacrifice is offered by the same High Priest employing successive generations of men ordained by Him for that purpose. The passage or expectation of death is sanctified by the sacrament or extreme unction. Thus the whole earthly life of every human being is organized in the body of Christ, and the whole organization of the church exists to realize that divine-human community. The history of the church cannot be understood unless its nature and function as the divine-human organism, wholly divine and wholly human and indissolubly one, is first recognized.

St. Luke ends his account of St. Paul's apostolate at Rome with the words "This salvation of God is sent unto the Gentiles." St. Paul himself explains the significance of that climax in the Epistle to the Galatians. As a Jew turning to the Gentiles he must claim that the old dispensation has been superseded and that to be "in Christ" (a phrase repeated six times in this Epistle and constantly used thereafter by St. Paul) is to belong to "the Jerusalem that is above" in which "there can be neither Jew nor Greek." It was only by the act of God that the sanctities and exclusions of the old law could be at once fulfilled and superseded, and hence the same authority which united Jew and Gentile realized the purpose of history. "If ye are Christ's then are ye Abraham's seed, heirs according to promise." In the Epistle to the Ephesians written probably from Rome this doctrine of divine consummation becomes explicit, "a dispensation of the fullness [pleroma] of the times, to sum up all things in Christ. . . for he is our peace who made both one and brake down the middle wall of partition . . . that he might create in himself of the twain one new man, so making peace, and might reconcile them both in one body unto God through the Cross." "So then ye are no more strangers and sojourners but ye are fellow citizens with the saints and of the household of God, being built upon the foundation of the apostles and prophets, Christ Jesus himself being the chief corner stone: in whom every building fitly framed together groweth into a holy temple in the Lord." (T. S. Gv.)

ORGANIZATION

The Catholic Church is governed by a hierarchy of bishops with the pope as bishop of Rome at the head. Under him patriarchs, archbishops and other greater prelates are possessed of various local jurisdictions over the bishops of their respective provinces. The church teaches that the origin of all this varied jurisdiction must be sought in the authority given by our Lord Himself, and recorded for us in the Gospels. Just as no man, not even an apostle or the chief of the apostles, could institute a sacrament, so it was not in the power of man alone to originate the fundamental organization of the church. Christ Himself before He ascended into heaven left the church an organized body, with a system of rule that could indeed be developed indefinitely to meet the constant changes which must inevitably occur as the centuries passed, but which in its fundamental principles must remain unchanged to the end of the world.

The bishop of Rome, who as head of the whole church acquired later on the exclusive title of "pope," was also the sole patriarch of the west, while Alexandria and Antioch governed most of the

east. In the 5th century two other bishops attained to the patriarchal rank, Constantinople as being the seat of the empire and civil capital of the world, and Jerusalem as the cradle of the church. Under these was a complicated and ever-varying system of jurisdictions of exarchs, metropolitans and archbishops, but the principle by which alone the whole system of subordination of one bishop to another can be justified, in view of the essential equality of all, can be found only in the special grant by our Lord of the primacy to St. Peter and the delegation of some share in that primacy to the rest of the hierarchy.

This principle, which was recognized even at Nicea, is symbolized and expressed by the practice of sending the pallium by the pope to every archbishop in possession of jurisdiction. The pallium comes from the tomb of St. Peter, where a supply is kept in readiness, and symbolizes and conveys such share in the Petrine primacy as belongs to the particular office. Till an archbishop has received his pallium from the pope, he cannot exercise any archiepiscopal jurisdiction, though he is possessed as soon as he is fully appointed of all the jurisdiction which belongs to him as bishop of his own diocese.

In 1950 the number of Catholics in the world was estimated at more than 400,000,000, governed by about 1,500 archbishops and bishops, each in his own diocese.

The Curia.—As the pope has the care of the whole church (that is, of many million Catholics spread throughout the world), there is need for an extensive and detailed organization at Rome adequate to cope with the varied questions that arise. This organization is called the Curia. (See the special article CURIA ROMANA for details.)

Cardinals.—At the head of the Curia is the College of Cardinals, numbering 70 in all when complete, whose members form the supreme senate of the church and the pope's immediate advisers. Historically the cardinals are the occupants of the six "suburban" sees, known as cardinal bishoprics; the incumbents of the principal parishes of Rome, known as cardinal priests; and seven who are the successors of the seven deacons responsible in early times for the more secular details of administration and who are known as cardinal deacons. But these ranks are distinct from the orders of the church and the cardinal priests are always bishops, and half their number being the occupants of various important sees and nonresident in Rome; while the cardinal deacons are nowadays always priests.

The cardinal secretary is, so to speak, the prime minister of the pope. It is his office to deal with all political affairs, and especially all diplomatic relations with the separate countries and governments. From his department depend the nunciatures and delegations which represent the Holy See abroad, and it is with him that the ambassadors from foreign countries to the Holy See do their business.

Congregations.—The work of the Curia is done by 11 permanent departments, called congregations, each with a cardinal at its head. These comprise: (1) the Holy Office; (2) the Congregation of Ceremonies; (3) the Consistorial Congregation, dealing with the appointment of bishops and other dignitaries, with the erection and division of dioceses and with episcopal administration; (4) the Congregation of the Eastern Church, dealing with the Uniates (see below); (5) the Congregation of Rites; (6) the Congregation of Seminaries and Universities; (7) the Congregation of Sacramental Discipline; (8) the Congregation for Religious, dealing with the affairs of regular orders; (9) the Congregation of the Council, dealing with the summoning and management of councils and also regulating parish priests, benefices and property; (10) the *Congregatio de Propaganda Fide*, for missionary organization; and (11) the Congregation for Extraordinary Affairs. The Congregation for the Fabric of St. Peter's is supernumerary.

Offices.—The ordinary routine business of the church is carried on by the offices; these, however, are not of so great importance as previously. They are: (1) the Chancery, which has little to do apart from the sending out of papal bulls; (2) the Dataria, dealing with those benefices the appointment to which is reserved to the Holy See; (3) the Apostolic Camera, which once controlled the affairs of the papal states and now has the care of the property

of the Holy See; and (4) the Office of Briefs (sent to princes) and of Latin Letters.

Tribunals.—The tribunals, which control the judicial functions of the Curia, are: (1) the Sacred Penitentiary, handling matters of conscience; (2) the Sacred Rota, formerly the chief court of the papal states, now the court of appeals from bishops' courts to the Holy See, consisting of ten judges who sit generally in threes but for very important cases in greater numbers; (3) the Apostolic Signatura, the supreme court of appeal, consisting of six cardinals and their assistants, to which an appeal lies from the Sacred Rota.

THE LATIN RITE

The great majority of Catholics are those of the Latin rite; *i. e.*, those who use the Roman liturgy and generally have used it without interruption since the establishment of a Christian church in their country; there are local variations of little significance. The following paragraphs describe the hierarchical system of the Latin rite.

Archbishops.—Besides their own episcopal jurisdiction over their own dioceses, these greater prelates, whatever their title, have a provincial jurisdiction over their "suffragan" bishops. This jurisdiction is one strictly limited by law, the presumption being always in favour of the bishop and against the archbishop. It is attached to the office and therefore is "ordinary" jurisdiction and affects the suffragan bishops immediately and the faithful of their dioceses through them. The extent of this jurisdiction varies considerably in different localities and is everywhere less extensive than in former years. It is the archbishop's duty to summon his com-provincials to the provincial synod, which need be done only once every 20 years, and in that synod he presides of right, though his vote counts for no more than that of any other bishop. If the suffragan bishop has neglected to carry out the canonical visitation of his diocese, the archbishop may visit, after obtaining permission from Rome, and has full power of redressing abuses. When any one of the suffragan sees becomes vacant it is generally the duty of the archbishop to see that the cathedral chapter elects a vicar capitular to carry on the administration of the diocese during the vacancy. An appeal lies from the court of any one of the suffragan bishops to that of the archbishop, and where the rights of the bishop are involved he may hear cases from that bishop's diocese as a court of first instance. Appeals from his own diocesan court, which formerly had to be taken to the Holy See, are heard by some one bishop selected by the archbishop for that purpose once for all and approved by the Holy See. The archbishop has always the right of pontificating in any church in his province and may bless the people, grant 100 days' indulgence and have the cross carried before him in the church. He may not, however, except when he holds a visitation, perform any other acts which imply jurisdiction.

Bishops and Dioceses.—The bishop and the diocese form the most essential part of the church's organization, being of divine institution under the primacy of the pope.

Bishops.—A bishop is nominated under different conditions in different parts of the world, but even after he has been thus canonically nominated he has no power until that nomination has been confirmed by the Holy See. Once this confirmation has been given and has been communicated to his cathedral chapter he has full possession of all episcopal jurisdiction, though he can do no acts involving the power of order, such as ordaining clergy or confirming children, until he has been consecrated. His jurisdiction is ordinary, limited by restrictions imposed by the Holy See, but independent of his people and even of his clergy. In certain important matters he is bound to seek the advice of his cathedral chapter, though he is not usually bound to follow it. He is bound to make a visit *ad limina* to the Holy See at stated intervals to report on the state of his diocese. His authority over his diocese is fourfold: (1) *teaching*, with authority over all schools, and the right of superintending all the publications of the faithful and especially of the clergy within his diocese; (2) *legislative*, in which his power is strictly limited by the *jus commune* and by all existing laws which have wider scope than the bounds of his own diocese, though he can dispense from all diocesan laws; (3) *judicial*, whereby he is judge of first instance in all cases that be-

long to the ecclesiastical tribunal, can in *foro interno* reserve to himself the absolution from certain sins and can enforce his sentences of ecclesiastics by suspending them from their functions; (4) *administrative*, whereby he can nominate, subject to any local rights of patronage, to all benefices in his diocese, can oblige ecclesiastics to undertake special work (though he cannot force the cure of souls upon them if they are unwilling) and has authority over all ecclesiastical property, so that none can be alienated or sold without his consent. But in nothing is his power unlimited—he is always subject to the precepts of canon law.

The Cathedral Chapter.—In the general regulations of his diocese the bishop must conform to the general laws of the church and must not do anything which would impair the general unity of church government. He has as his constitutional council, to assist him in the work of government, the canons of his cathedral chapter. The cathedral itself is the church in which he has his seat (*kathedra*), and this he cannot choose at will, the pope reserving to himself the right of erecting a church to be a cathedral, as well as that of instituting a chapter. Generally, of course, the bishop finds both already established and in existence. The appointment of individual canons is generally in the hands of the bishop, though the appointment of dignitaries in the chapter is often reserved to the Holy See. As the chapter constitutes the diocesan senate, the bishop is bound to convene it and to ask its consent or advice in important matters. In some matters which touch diocesan rights or affect diocesan property, its consent is necessary and the bishop cannot validly act without it. In other matters, though the advice of the chapter must be asked, the bishop is not bound to act upon the counsel tendered. When the see is vacant by the death or resignation of the bishop, the chapter succeeds to his ordinary jurisdiction, but not to any jurisdiction that was personal to himself. Within eight days after the vacancy the chapter must elect a vicar capitular, to whom the whole administration of the diocese immediately passes. In the United States and elsewhere, where cathedral chapters have not as yet been constituted, a body of diocesan consultors has generally to be appointed by the bishop, and he is bound to ask the advice of these consultors on important matters, though they have not the power of vetoing his action.

The Vicar-General.—The bishop generally appoints one or more priests to assist him, deputed to them with a certain universality of power all his own jurisdiction within the diocese, so that the vicar-general is his alter ego, and no appeal lies from the one to the other. By virtue of this general mandate the vicar-general exercises ordinary jurisdiction throughout the diocese in the bishop's name. This jurisdiction however, being dependent on that of the bishop, ceases at the bishop's death, or with the cessation of the bishop's own jurisdiction. The office of a vicar-general ceases also with his own death or resignation, or with the withdrawal of his vicarial mandate, which last, however, can be taken from him only for a grave cause, allowing of an appeal to the Holy See.

The Diocesan Chancery.—This is the office through which the ordinary and routine work of the diocese is carried on. At its head is the chancellor. His duties are to carry on the official correspondence of the diocese and to see that records are duly kept. He can be removed by the bishop, but by the vicar capitular during a vacancy only with the consent of the whole chapter.

The Parish.—Where the full organization of the church is in force, the diocese is subdivided into parishes covering the whole ground. Each parish should have its own church and be under its own pastor, having care of souls and irremovable except for grave cause. But where the full organization is not in force, there are quasi parishes, with pastors who do not possess the full rights of parish priests. The full parish system has not yet been introduced either in England or the United States, though certain mission districts or quasi parishes have pastors who are not removable at the will of the bishop. The bishop can alter the boundaries of parishes, erect new ones or join two together where there is just cause for so doing. He is bound, however, first to ask the counsel of the chapter, though he is not bound to follow it

The pastor of a properly constituted parish has ordinary jurisdiction. His rights within the parish are regulated by canon law and include the faculties of preaching, celebrating Mass, hearing confessions and administering the sacraments, though he can delegate this authority. Where the parish is too large to be administered by one priest, assistant priests are sent by the bishop to help him. These assistants are appointed by the bishop (though in some places the parish priest has the right of nomination) and are removable by him, but only for just cause. Their jurisdiction is delegated and they receive their faculties from the bishop.

If the parish priest is ill or incapacitated for any reason, the bishop must send a coadjutor to fill his place and in like manner will appoint an administrator of the parish during a vacancy.

Vicars Apostolic.—In districts where the ordinary hierarchy of the church has not yet been established and there are no proper dioceses erected, the Holy See governs directly by means of a delegate who has received episcopal consecration to a titular see and who has the title of vicar apostolic or prefect apostolic. The main difference between the two is that the vicar apostolic is bound to make the visit *ad limina* at certain intervals, while the prefect apostolic is not. They are not diocesan bishops and therefore have no cathedral and no chapter, and all their powers are delegated and not ordinary. Otherwise they enjoy as a rule all the powers that bishops have by canon law in their own dioceses. They have no vicar-general, though they can give special faculties to individual priests to enable them to assist in the rule of the district, and as they have no chapters they are bound to nominate three or more of their leading priests to act as counsellors. There are vicariates apostolic, prefectures apostolic and "missions."

THE UNIATE RITES

All that has been written so far about the local organization of the Catholic Church applies only to the western church and the Latin rite, which include the vast majority of Catholics. But there are also a number of so-called Uniate churches in full communion with the Holy See but organized separately. These do not represent, as is often thought, any sort of compromise or intermediate position between western Catholicism and the various schismatic or heretical churches of the east. All the Uniate churches accept the full Catholic faith and are in matters of doctrine absolutely at one with Rome. They all accept the full primacy of the Holy See and are subject to its supreme jurisdiction. Each Uniate church retains its old privileges and represents the church of its district or country as that church would have been had the schism never occurred. In no case, however, has the succession from the ancient hierarchy been preserved, but a new hierarchy has been instituted from Rome, with the old titles and privileges and with the preservation of the ancient rite. The object aimed at by Rome in instituting a Uniate church is not the latinizing of the ancient rites but the union of hearts in the one faith and under the one primacy of the Holy See.

Religion in the east has always been far more a matter of nationality than it has in the west. It has been found impossible, therefore, to carry out the strict system of territorial jurisdiction which obtains everywhere in the west. In the east the churches are distinguished rather by nationality, by languages and by rite than by locality, and in consequence there is a system of interpenetrating jurisdictions. There are, for instance, seven patriarchs of Antioch. Of these, three are schismatic, but four are in communion with the Holy See, the Latin patriarch, whose position is merely titular (originating during the crusades) and who resides in Rome; the Melchite patriarch, the Maronite patriarch and the Syrian patriarch. These last three have jurisdiction over the Catholics of their own rite only.

The Uniates in Europe are more or less directly subject to the general system of the Catholic Church. Those in Asia and Africa, however, since the rights of the patriarchates have been preserved, enjoy greater autonomy, being ruled by the Holy See mainly through their respective patriarchs. (A. S. BA.; X.)

The Byzantine (Greek Catholic or Græco-Slavonic Rite).—Uniates of this rite represent churches that maintain, in their

various languages, the liturgy of Constantinople while acknowledging the doctrinal and hierarchical supremacy of the Holy See. The most important of these churches is the Ruthenian: this includes an archbishopric of Lwów (with suffragan bishoprics at Przemyśl and Stanisławów) and bishoprics of Uzhorod, of Presov (under the Holy See), of Hajdudorog (under the Latin archbishop of Esztergom) and of Krizevci (under the Latin archbishop of Zagreb). The important dates for its union with Rome are those of the synod of Brest-Litovsk (Brzesc; 1596) and of the submission of Lwów (1700). In Poland persecutions were organized by the Russian government in 1795, 1839 and 1875 and after World War II.

The Rumanian Uniates have an archbishopric (Alba Iulia and Fagaras, established in 1701) with four suffragan bishoprics. The Russian Uniate archbishopric (Mogilev, with four suffragans) was subjected to a compulsory latinization under the tsar Alexander II. There are Catholics of Byzantine rite, however, in Greece, Bulgaria and Turkey. The Italo-Greek (Albanian) Church in Calabria and Sicily has the bishoprics of Lungro (founded in 1919) and Piana, both under Latin archbishops.

Of the Byzantine rite also are the Melchites (or, more properly, Melkites) of Syria, Lebanon, Jordan and Egypt, whose liturgy is in Arabic. They are so much to be distinguished from the Europeans of the Byzantine rite, however, that the term "of the Melchite rite" is now used of them. Their name, meaning "king's men," was originally a term of disparagement bestowed by their Monophysite fellow countrymen on those oriental Christians who remained loyal to Constantinople and therefore to the eastern Roman emperor's ("king's") religion after the council of Chalcedon (451). Their change from the Byzantine allegiance to the Roman is generally dated at 1724, when the patriarch Athanasius Dabbas acknowledged the Holy See on his deathbed; but his Catholic successor, Cyril VI Tanas, was deposed, and it was not until 1834, after the Egyptian invasion of Syria, that a Catholic patriarch was returned in the person of Maximus III Mazlum (confirmed by Rome in 1836). The Melchite patriarch of Antioch resides at Ain Traz in Lebanon. There are archbishops of Aleppo, of Beirut and Jebel, of Bostra and Hauran, of Damascus (two suffragans), of Emesa, of Tyre (four suffragans) and of Jordan.

The Armenian Rite.—Uniates of this rite use a liturgy adapted from that of the Gregorian (Monophysite) Armenian Church. Their connection with Rome is sometimes dated from 1798; but a stronger movement of union began with the Dominican missions in the 14th century, although the specifically Armenian hierarchy was not established till the middle of the 18th. The patriarch of Cilicia resides at Bzommar near Beirut. There are archbishops of Mardin, of Sebaste (Sivas) and Tokat, of Aleppo, of Constantinople and of Lwów; bishoprics of Isfahan, of Beirut and of Alexandria, as well as 12 bishoprics in Turkey; and also churches in Greece and in Rumania. The Melchitists (q.v.) of Venice are Armenian Uniates.

The Coptic Rite.—The Uniate church of this rite, in Egypt, in Ethiopia and in Eritrea, is of course drawn from the Coptic Church of the Egyptian Monophysites and has a liturgy in the Coptic language. The Catholic Coptic patriarchate of Alexandria was founded in 1895. There are suffragan bishoprics of Heropolis Magna and of Thebes.

Syriac Liturgies.—Whereas the provenance of the Byzantine, the Armenian and the Coptic rites of Uniates is easily understood, that of the various Syriac rites may require some preliminary explanation. Historically, there are two sources: the East Syrian, Assyrian or Nestorian *Liturgy of the Apostles Addai and Mari*; and the West Syrian, Jacobite or Monophysite *Liturgy of St. James*. The former gave rise to two Uniate rites, the Chaldean and the Syro-Malabarese; the latter to three, the Syrian, the Maronite and the Syro-Malankarese. However, a classification here by East Syrian and West Syrian groups would involve difficulties of nomenclature and a misleading fusion of distinct bodies. The rites will therefore be introduced separately.

The Chaldean Rite.—The Uniates of this rite, mainly in Mesopotamia and Kurdistan, use the *Liturgy of Addai and Mari* and

have also a Syriac vernacular. Union with Rome is dated at 1551, when John Sulaka led the first group of converts from Nestorianism, and at 1680, when Joseph of Amidā (Diarbekr) led the second. The patriarch of Babylon resides at Mosul, and there are archbishops of Keruk and of Urmia and eight suffragan bishops.

The Syro-Malabarese Rite.—Catholics of this rite represent those Christians of St. Thomas (see THOMAS, SAINT) who were converted to the Roman allegiance by the Portuguese at the synod of Diamper (Udayamperur, in Cochin) in 1599. They use a form of the *Liturgy of Addai and Mari*, as their antecedents were Nestorian. The archbishop of Ernakulam has suffragan bishops of Changanacherry, of Kottayam and of Trichur.

The Syrian Rite.—The term "of the Syrian rite," though in a general sense applicable to several churches, is used specifically to designate Uniates using the Syriac *Liturgy of St. James*, with certain formulas in Carshuni (Arabic written in Syriac), and representing Christians formerly of the Jacobite persuasion who were united with Rome in 1646. Their patriarch of Antioch resides at Mardin in Turkey, and there are archbishops of Damascus, of Emesa, of Baghdad and of Mosul, as well as four diocesan bishops.

The Maronite Rite.—The Maronites (q.v.) of Lebanon represent a community which was probably at first Monothelite, originating after the council of Constantinople in 680-681. Though they renounced Monothelitism in 1182 and were united with Rome till the end of the Latin kingdom of Jerusalem, the connection was subsequently broken and not permanently resumed till 1736. As the Syrian Uniates, they use principally the *Liturgy of St. James* and formulas in Carshuni. Their patriarch of Antioch has authority over bishops of Aleppo, of Beirut, of Cyprus, of Damascus, of Heliopolis, of Jebel and Batrun (Botrys), of Sidon, of Tripoli and of Tyre.

The Syro-Malankarese Rite.—When the Dutch in 1663 put an end to the Portuguese domination of Malabar, numbers of the Malabarese abandoned the Roman connection (see above, *The Syro-Malabarese Rite*) but, instead of reverting to Nestorianism, accepted in 1665 a Monophysite bishop from the Jacobite patriarch at Mardin. In 1930, therefore, when some of these Jacobites were united with Rome again, the *Liturgy of St. James* was retained. The archbishopric of Trivandrum (established in 1932) has a suffragan bishopric at Tiruvalla. (X.)

HISTORY

The human institution that is the fullness of the godhead bodily was to be governed on earth by a sacramental sovereign as agent or representative, the apostle or "vicar" of Christ. That this "vicar of Christ" should be the bishop of Rome belongs to the "logic of history"; and, in the faith that "the Word which is God became flesh and dwelt among us," history assumed a validity not realized before or elsewhere. If, in "the fullness of time, God sent forth His Son born of a woman," He selected the Roman imperium as the historical circumstance of that incarnation, Rome was not merely the metropolis of that humanity but the seat of an actual and formative sovereignty beyond comparison more effective and significant than that of any other imperial city. Here if anywhere the City of God must encounter the "fullness of manhood bodily." Within a generation of the death of the apostles, Roman legions had destroyed the temple at Jerusalem. Less than a century later the tradition of St. Peter's presence in Rome was, as Louis Duchesne stated, "precise and universal." Duchesne further declared that Dionysius of Corinth in Greece, Irenaeus in Gaul, Clement and Origen in Alexandria and Tertullian in Africa all referred to it, that in Rome itself Caius, about 200, pointed out the tomb of the apostles, that by the 3rd century popes built on their title of successors of St. Peter and that their right to this title is nowhere denied. Clement (c. 97) thinks it natural for the church in Rome to address a letter of advice to the church in Corinth upon the outbreak of an "execrable and godless schism." Ignatius of Antioch apostrophizes the Roman Church with a series of titles such as he addresses to no other. It is above all "a church presiding in charity, maintaining the law of Christ,

and bearer of the Father's name." At his martyrdom he asks for the prayers of the Roman Church for the church in Syria since "Jesus Christ alone will be their bishop, together with your charity." (*Ancient Christian Writers*, vol. i, tr. J. A. Kleist, Newman Press, Westminster, Md., 1946.) Irenaeus, who came from Asia Minor and wrote Greek in southern Gaul, and whose work found an immediate public in Egypt, was world-conscious and belonged to a world community not only as a theologian but as a subject of the Roman empire.

The city of the Caesars and of the senate and people of Rome was the seat of the apostles; it was also the city of martyrs and heretics. Persecution and heresy contributed to the mature self-consciousness of the church. The offense of Christianity as defined by Trajan (c. 112) was of the nature of treason—otherwise harmless. The greatest persecutions, those under Decius (250-253), Valerian (257-260) and Diocletian (303-311), were virtual acts of war against an *imperium in imperio* which seemed to threaten the empire. The danger would have been as real as it seemed but for the peculiar combination of faith and morals which enabled Christians to "dwell on earth as citizens of heaven" (*Epistle to Diognetus*). They could thus pray for the emperor's welfare while they denied his divine title (Cyprian). "They obey the established laws, yet their conduct goes beyond those laws"; and "Exposed to the wild beasts to make them renounce the Lord, are they not seen to remain invincible?" (*Epistle to Diognetus*). Origen's confidence that Christ is stronger than the emperor, the army and the senate and people of Rome was inevitably and essentially Christian. The organic unity, the *κοινωνία θέντος*, of the church was vigorous and visible in ceaseless missionary activity at every level of society and in every province. Christians nursed the sick, visited the prisoners, found employment for the idle and cared for the poor, orphans, widows and slaves. All this, inspired and confirmed by a naïf sense of divine presence, omnipotence and justice, gave the church not only authority over the whole life of its rapidly multiplying membership but an independence of imperial sanctions. Half the interval between Nero and Constantine was persecution, and Diocletian had reason to complain that, Christians did not fear death. The martyrs were not only the army of the church: they made explicit what the Christian faith had always implied, a totally new conception of the majesty of the human being as such and of human institutions. Constantine may have been a mystic, but he was certainly a political realist. Paganism died of its unreality. Julian's attempt to revive it in revolt against a corrupt and heretical Christianity (361-362) was no more than an adventure of sentiment and ideology.

Meanwhile the church defined its faith and established an orthodoxy. Definition is not, in the Catholic view, identical with the faith, but it is the means by which the faith becomes incarnate and available in the world and, as such, is implied in and authorized by the incarnation of God. It is thus conditioned by the "fullness of time" and is given to the church by the same authority that created the church, when and as the purpose of redemption and the existence of the church require it. So given it is infallible and final; but it is also the conclusion of a stage in the history of the church on earth, and its enunciation is prepared by a period of questions and uncertain or inadequate or controversial answers. The New Testament, whose canon was fixed c. 120, and the formula known as the Apostles' Creed, used for the instruction of catechumens at the beginning of the 3rd century, both reveal the doubts and questions which assailed the primitive Christian. The Gospels and the Acts were historical documents; the creed is a catalogue of facts. As against the Jews, the apostolic church proclaimed an eschatology which was no longer a promise but a present reality. As against the docetism and gnosticism which represent the perennial reluctance to accept the faith as a fact, the New Testament and the creeds emphasized the event and the institution. Gnostic theories—those of Cerinthus, Valentinus, Basilides, Carpocrates and others—were not and did not claim to be histories. They were cosmological myths and speculations, ingenious and sometimes profound metaphysical guesses, against which the primitive church affirmed the supernatural history and, in doing so, realized its own divinely appointed form and

existence. Fact implied revelation; revelation implied authority and tradition; and all implied the presence on earth of God in the person of Christ and in the Holy Spirit who informed the Holy Catholic Church. Irenaeus (c. 186) finds the authority in "the tradition of the great and ancient church known to all men which was founded and constituted by the most glorious apostles Peter and Paul: by its traditions and its faith announced to all men and descended through the succession of its bishops to us, we confound all those who gather where they ought not" (*Adversus haereses*, iii, 381). Irenaeus, who wrote against the Valentinians, gave also an account of all the principal heresies down to his time. Justin wrote, besides his *Apology*, a *Synagma* against all heresies, which is lost. Hippolytus in his *Synagma* attacked 32 heresies. Epiphanius in the 4th century catalogued 80 heresies in the *Panarion*. "The Jewish strain in Christianity with its abomination of the Gentile worship and its assumption that they connived immorality; the links of community to community which prevented unfettered development; the hierarchic system; the principle of apostolic authority and apostolic tradition; the numerical preponderance of folk with the *loi du charbonnier* prevented what would in effect have been the absorption of Christianity in Graeco-Roman culture." (A. D. Nock, *Cambridge Ancient History*, vol. xii, p. 446.)

FROM CONSTANTINE TO CHARLEMAGNE

Imperial conversion brought into the church all the problems of the empire. Of these the most urgent was the pagan habit of toleration expressed in the Edict of Milan (313), issued in the name of Licinius and Constantine, that "everyone may have licence to worship whatever he pleases." Such toleration came to the Christians as relief, but imperial protection raised the old question of Christ and Caesar in a new, subtle and dangerous form. It not only threatened to confound the church with imperial administration but exposed the faith to the speculative ingenuity and dispute endemic in paganism. These two secular problems coalesced to make theology the subject of party strife. The teaching of Arius, according to whom the *Logos* was a creature not divine but free, mutable and adopted as Son of God in provision of his merits, revived the ancient reluctance of the philosophical pagan to accept the incarnation as a fact and relieved the Arian of the revelation and authority which faith in the supreme mystery demanded and presupposed. It was a rationalization not apostolic or holy or catholic, and the Christians who adopted it ceased to be Christian. At the council of Nicea (325) the word *homousios* ("consubstantial"), accepted to affirm the deity of Christ against the Arians, was probably suggested by Roman legates. Eusebius, bishop of Nicomedia, who had learned his theology from Lucian of Antioch, used the heresy of his fellow-student Arius as an occasion of intrigue. Without disputing the decrees of the council of Nicea he devised an imperial formula to comprehend Arians and Catholics and gained the support of Constantine and Flavius Julius Constantius (337-361) for a policy which seemed to promise imperial peace and actually promoted ecclesiastical dissension. This policy not only raised Arian bishops to most of the eastern sees but meant also constant interference *a latere* by bishops in the jurisdiction of their brother bishops, the employment of imperial prefects and police in the enforcement of partisan decrees and the habit of using theological formulas not to define the faith but as instruments of ecclesiastical diplomacy. Thus by the carefully packed council of Tyre (335) Athanasius was deposed on frivolous charges and an Arian, George of Cappadocia, raised with the aid of imperial police to the see of Alexandria. At Antioch in 341 an assembly of 100 bishops issued an ambiguous formula denying that they were followers of Arius but evading the Nicene Creed. Finally, in 359, imperial pressure enforced a similar evasion on the whole episcopate, both western and eastern, at the councils of Ariminum and Seleucia. In 360 the formula was accepted which "with a little complaisance Athanasius and Aetius might have repeated together"; and in 361 Constantius was succeeded by Julian, and Arian victory by pagan reaction.

Rome and the west remained comparatively free from the

heresy and policy of the east. No longer head of the empire, Rome was still head of the church; the decline from its imperial status emphasized its ecclesiastical independence. The bishop's residence was established on the Caelian hill in the ancient house of the Laterani, owned by Fausta, the emperor's wife; and there Pope Militades held a council in 313. A basilica was raised, the existing church of the Lateran. Athanasius, exiled from Alexandria, visited Rome in 339. His news of Antony, Pachomius and the desert fathers kindled among wealthy Romans an interest in ascetic and monastic life which bore fruit in the next generation; and before Pope Julius and a council of 50 western bishops he was acquitted of the charges which had led to his deposition at the council of Tyre. The eastern bishops, who had asked to be invited to this council in Rome, nevertheless declined the invitation when it came. To their ultimatum requiring him to choose between Athanasius and themselves, Pope Julius replied that it was natural to hear complaints of bishops who said that they had been unjustly deposed; that in the absence of accusers he had examined the only available evidence, which they had themselves supplied at the council of Tyre; and that he was concerned not with trifling stories but with the unity of the church (340).

Roman theology had not generated the controversial and speculative subtleties which divided the east. A schism left by persecution, between those who had endured and those who compromised with the pagans, had occasioned some disorder which was soon overcome. A greater schism, that of the Donatists, rent the diocese of Carthage. To the historian its main interest lies in its effect upon Augustine, who during 16 years of controversy matured his conception of the Catholic Church. From 413 to 426 he was writing *The City of God*. He was baptized by Ambrose in 387. Two years earlier Jerome (c. 340-420) had retired to Bethlehem to complete his translation of the Bible (Vulgate). Ambrose, born at Trier about 340, son of the prefect of Gaul, became prefect of Upper Italy in 369 and, on the death of Auxentius (who had accepted the confession of Ariminum), was appointed bishop of Milan. So complete was the popular acclaim that the bishops accepted it as a sign of divine will, as it was certainly human prudence. One of the best of Roman governors thus became one of the greatest of Christian bishops. His most significant task was to resist the inclination of the empire to control the church. A little younger than Ambrose, his friend Theodosius was made Augustus in 379 and in 380 was baptized a Catholic. In 381 he summoned a council to Constantinople (the second general council). Ambrose at the same time presided over a council at Aquileia. Both condemned Arianism; Theodosius decreed that "all beliefs contrary to the faith clearly taught by the pontiff Damasus and by Peter, bishop of Alexandria, were heresy." He ordered all church property to be restored to the orthodox and named the bishops who were to be so accounted. The council also declared that "the bishop of Constantinople shall have the pre-eminence of honour after the bishop of Rome, for this city is the new Rome," thus founding ecclesiastical dignity on imperial status. Rome rejected this principle. In 383 Theodosius convoked a meeting of Catholic and Arian leaders, and upon its failure issued another edict, never strictly enforced, forbidding heretical worship public and private. So in Milan, Ambrose refused to allow a single Arian church even for Justina the mother of Gratian and the advance of Maximus through Gaul and Italy called Theodosius to the west, where, after the defeat and death of Maximus, he resided for nearly three years at Milan. Valentinian II also lived there, likewise under the personal influence of Ambrose. The bishop proclaimed and maintained the principle that "the emperor is within the church, not over the church," a principle repeated by Pope Leo I (the Great) after the council of Chalcedon (451): "*Alia tamen ratio est rerum secularium, alia divinorum; nam praeter illam petram quam Dominus in fundamento posuit, stabilis erit nulla constructio.*" Such was the principle also of Augustine's doctrine of the two cities, and such from the 5th century to the 10th was the fact demonstrated by the rise and fall of innumerable "powers" with the consistent spread and development of the one catholic Christendom.

Pope Leo was called upon to state once more and in uncon-

promising terms the fact in which and by which the Catholic Church exists. The heresy at Chalcedon was that of the Monophysites, who declared that there was but one nature in Christ, the divine—another form of the perennial desire to evade the central Christian dogma. The pope's definition, acclaimed by the council as "the voice of Peter," was an uncompromising statement of the fact:

Following, then, in the footsteps of the holy fathers, we all teach in harmony that the Son and our Lord Jesus Christ are one and the same, one and the same perfect in godhead, the same perfect in human nature, true God and true man, the same made of a rational soul and body, consubstantial with the Father according to His godhead, consubstantial with us according to His human nature, made in all things like us without sin: according to His godhead begotten of His Father before all ages; the same in these last days for us and for our salvation born according to human nature of the Virgin Mary, the Mother of God; one and the same to be acknowledged as Christ the Son, the Lord, the only begotten, in two natures not removed by reason of their union, but rather the characteristics of each preserved united together in one person and subsistence, not divided nor shared among two persons but one and the same: Son, Only-begotten, God, Word, Lord, Jesus, Christ, as the prophets before had said of Him, as He Himself taught us and as the creed of the fathers has handed down to us.

In that statement, there is obviously no attempt to placate human reason and no appeal to human experience. Words are used to command a rational submission of faith to a fact which transcends reason. It is the voice of original authority, not a resultant explanation; foundation, not superstructure—"the stone which the Lord laid as a foundation." Man is whole, is perfectly and eternally human in Christ who is Very God. Nothing can violate the distinction between God and man. The incarnation does not violate but transcends it, and it is thus not an evolution but the consummate act of transcendent godhead which the church announces and embodies. It purports to be a statement of the atonement and sacrifice in which human nature is restored to perfect unity with divine or absolute being. It is announced and accepted as fact by the Roman bishop, "the voice of Peter," at the council of Chalcedon. Thus by the 5th century the church is fully conscious of itself as the issue of that supernatural union, wholly human, wholly divine. From that position there could be no retreat.

The fall of the western empire (476) completed the isolation of the Roman see. Arianism, expelled from the empire, had been established meanwhile among the Goths of the Danube by Ulphilas (Wulfila; d. 383), appointed their bishop by Eusebius of Nicomedia. He taught a Gothic Christianity in the Gothic language, inventing an alphabet and translating the Scriptures. Untrammelled by orthodoxy, this faith needed no apostolic see and was adopted by Goths, Suebi, Burgundians, Vandals and Lombards as a kind of national religion. Gradually the west had been subdued by conquest and infiltration to these races: Africa to the Vandals, Spain to the Suebi and Visigoths, Gaul to the Visigoths and Burgundians. The Avars wasted Pannonia, the Slovenes Styria, Carinthia and Carniola. The Croats and Serbs established themselves south of the Save. Italy was defended by a barbarian army under the Herulian Odoacer, a Catholic, until his defeat and death in 493 at the hands of Theodoric the Ostrogoth, an Arian, who ruled Italy from Ravenna with conspicuous ability and tolerance with the advice of the Catholics Boethius (480-524) and Cassiodorus (c. 490-c. 583). After Theodoric's death (526) Italy was conquered by the Catholic emperor Justinian's armies (535-554) under Belisarius and was till the 8th century officially a province of the Byzantine empire under the exarch of Ravenna. The Lombards conquered northern Italy and established themselves at Pavia. At once subject to repeated attacks from the Franks and extending their own conquests in Italy, the Lombards, unlike the Goths, had neither genius nor opportunity for peace. Thus when Gregory I the Great became pope he succeeded to what might be described as "the grave of the deceased Roman empire." He had been praetor and then monk and had lived three years in Constantinople as the nuncio of Pelagius II seeking imperial aid against the Lombards. As Roman and as pope, he saw the world as a whole. Lawyer and judge by training, monk, bishop and apostle by vocation, he realized the creative and redemptive pos-

sibilities of the papacy and of the Catholic Church at the moment when outside it and apart from its supernatural certainty all civilization in the west was dead beyond hope of resurrection.

During the next six centuries the function of the church was to create Christendom, and its chief instruments in this work were episcopacy and monasticism. During Gregory's pontificate the Arian rulers of the Lombards in Italy and of the Visigoths in Spain were baptized Catholics. In 597 his mission of 40 monks landed in Kent under Augustine, "their abbot made bishop, with my permission, by the bishops of Germany and with their assistance conducted to that nation at the limit of the world." A century earlier (496) Clovis with 3,000 Franks had been baptized by Remigius, bishop of Reims, and was exhorted by Avitus, bishop of Vienne, to spread the faith among the barbarians "corrupted by heretical doctrines." Clovis had respected the property, person and advice of bishops even as a pagan, and he owed his conversion partly to the prudence which recognized in them the virtual rulers of Gaul. He broke the power of the Visigoths at Vouillé near Poitiers and extended his dominion to the Pyrenees, everywhere requiring Arians to become orthodox and restoring their churches after their reconsecration. In Paris, the seat of his government, he built and dedicated a basilica to the Holy Apostles. In the 5th century the monk St. Severinus, a friend of Odoacer, established the authority of personal sanctity over the peoples of the upper Danube. During the 7th, 8th and 9th centuries the Croats were Christianized by Roman missionaries; the Bavarians of Upper Austria by St. Rupert of Worms, who founded a see and a monastery at Salzburg (c. 700) that Charlemagne made an archbishopric (798); Moravia by the Greek monks Methodius and Cyril (Constantine); and Bohemia by its prince, whom St. Methodius baptized (871). Prague became a see in 973. The Magyars, who had withstood a succession of missions from east and west, were at length converted under Stephen I, who established the metropolitan see of Esztergom (Gran) and founded the monastery of Pannonhalma near Győr Saint Martin (Martinsberg) with five other houses and was crowned with the golden crown sent by Pope Sylvester II on the Feast of the Assumption, 1001.

Monasticism was the Christian equivalent of the imperial army, the means by which the church subdued and enlisted, colonized and administered the new peoples or revived or defended the old. The first western monk, St. Martin of Tours (c. 316-c. 400), was a Pannonian, born of pagan parents and bred a soldier; he secured his discharge in order to renounce the world. Under St. Hilary of Poitiers (c. 300-c. 368), himself a convert, Martin established a monastery at Ligugé and another at Marmoutier on the banks of the Loire. As monk and bishop of Tours he devoted himself to an ascetic discipline and to the conversion of pagans. Other monastic communities gathered at Marseilles (St. Victor) and at Lérins (St. Honoratus or Honoré) whence another St. Hilary was appointed bishop of Arles (426). St. Patrick visited Lérins and Marmoutier before setting out on his mission to Ireland, for which he was consecrated by Germanus, bishop of Auxerre, about 480. He was born St. Benedict of Nursia (q.v.), whose *Regula monachorum* or Rule (c. 515) became the pattern of all western monasticism. "For thee, therefore, whosoever thou be, my words are intended who, giving up thy own will, dost take the all-powerful and excellent arms of obedience to fight under the Lord Christ, the true King." In that conception of service and society lay the seeds of the rivalry between natural and supernatural sovereignty which appeared full-grown in the 11th and 12th centuries. (See also BENEDICTINES.)

A few years older than the *Digest* of Justinian (who was certainly acquainted with it), the Rule established a discipline and constitution and regulated a liturgical society with impersonal precision. It represented the religious as the *Institutes* represented the civil society. The Rule required self-surrender rather than self-abnegation. Based on long monastic experience and devotion to the person of Christ (who is to be seen and served in the abbot and in all the brethren, in strangers who visit the monastery and in all its life and work), it was the perfect instrument for creating centres of Christian society above all in rural and

pagan territory and for reforming the religious communities of the west. Thus a rational economy, moral training and education in the arts of peace developed about the altars of the church and were available to transform the secular barbarity of war and heroic solitude into Christian civilization. The Irish monk St Columban, whose rule followed the older pattern of extreme austerity, established four houses for men and two for women in Gaul. His disciple Gallus founded St. Gall on the shores of Lake Constance. Columban died at Bobbio, which he founded as a mission to the African Lombards and equipped with books, the nucleus of the most famous of mediaeval libraries. Cassiodorus, Theodoric's minister, attempted in 535 to found a Christian academy in Rome and, failing this, established a house at Squillace in Calabria (Vivarium) with a library for which he composed his two handbooks on divine and liberal learning. "But for the existence of such a sanction for literary culture, it is quite possible that, with the exception of Virgil, no Latin classic would have reached us in a complete form" (Montague James, *Cambridge Medieval History*, vol. iii, p. 486).

The greatest single achievement of monastic missions was the conversion of Britain. Thanks to Gregory I and Augustine, English monasticism was Benedictine. The Benedictine abbey at Canterbury was the metropolitan church. The influence of this type of mission was apparent at once. It created a culture, introduced the Roman alphabet and inspired a literature first in Latin and then in the vernacular. It acquired lands and rights which were recorded in documents and, as its teaching influenced custom, it codified the laws, as Bede says, "*justa exempla Romanorum*." The fact that England, unlike Gaul, Italy and the lands of the continental barbarians, had nothing but pagan custom and a rudimentary civilization gave the monks a more complete victory.

The attachment of English Christianity to the Roman see was the stronger as Gregory I was the apostle of the English; and Christianity without imperial tradition and Roman law was free to develop with and through indigenous custom. Benedict Biscop is said to have made seven pilgrimages to the tomb of the apostles. He visited Lérins. On the third journey he brought with him Theodore of Tarsus and Abbot Adrian of Naples, both monks who brought a knowledge of Greek and an infectious love of learning (668). Aldhelm (c. 640-709), trained at Malmesbury and Canterbury, abbot of Malmesbury and bishop of Sherborne, architect, Latin scholar and English poet, represents the first fruits of this English culture, whose greatest figure is Bede (c. 673-735). His contemporary St. Boniface or Wynfrith (d. 754), a monk of Exeter, carried the mission with the sanction of Pope Gregory II and the help of Charles Martel into Bavaria, Thuringia, Friesland, Hesse and Saxony. He established eight bishoprics and founded many monasteries, above all Fulda, where he hoped to die. He reformed the work of Irish monks with Roman and Benedictine discipline. In 747 he was appointed primate of his great province of Mainz. In 751 he consecrated Pippin, who with the authority of Pope Zacharias had been elected king of the Franks and in imitation of the English kings wished to be anointed. St. Boniface finally resigned his see and went to preach the faith to the Frisians, by whom he was martyred (754).

Meanwhile, in the civilized east the Christological discussion continued. The pope, though a subject of the (Byzantine) emperor, was head of the church, and the east, always divided in faith, had always been uncertain in ecclesiastical submission. The churches of Egypt and Syria, strongholds of Monophysite theology and jealous for the dignity of Alexandria, had refused the decision of the council of Chalcedon. The emperor Zeno tried an accommodation, the *Henoticon* (481). Justinian, a Macedonian Catholic, in the controversy of the "Three Chapters" (553), forced the aged Pope Vigilius to attend the fifth general council at Constantinople and to assent to the condemnation of Theodore of Mopsuestia, Theodoret and Ibas, three writers who had been accused and acquitted of Nestorian heresy at Chalcedon. The emperor Heraclius tried the formula known as Monothelitism, which ascribed one "active energy" to the Saviour, translated by the Latin bishop as "one will"; and Pope Honorius, mistaking the

question, professed himself willing to assent. Pope Martin I (649-653) refused this concession and was exiled by the emperor Constans II (641-668) to the Crimea. The sixth general council (680) vindicated Martin I, condemned Monothelitism and criticized Honorius. Nevertheless, in 692 the council in *Trullo* (Quinisext) was deliberately anti-Roman, and Pope Sergius, arrested at the orders of Justinian II, was saved only by force from the imperial officer. Finally the emperor Leo III the Isaurian (717-740) had initiated his campaign of iconoclasm in 725, the most unpopular and unnecessary of reforms, enforced by persecution and confirmed by the council of Hieria in 753. The schism endured till 843.

But the emperor, if he was willing to force the Roman bishop to submit in matters of doctrine, was quite unable to defend his Roman subjects from their enemies in the flesh. It was out of long Roman experience that Pope Zacharias (741-752) answered Pippin's question concerning kingship that the king should be he who really has power to rule. Neither Roman nor Byzantine sovereignty had been bound by a doctrine of legitimacy, the prince was the guardian of *fas* and *pax*. In Rome the bishop and the people were bound together by ties of faith, history and administration. The walls, defenses, aqueducts, food, hospitals, finance, justice and religion were in the bishop's charge. Not only the city but the west as a whole was in need of defense. In 711 Spain and Sardinia had fallen to the Arabs. Sicily was frequently raided by Saracens, who exacted tribute from Syracuse. In 732, at Poitiers, Charles Martel broke the Moslem invasion, saved Aquitaine and established his title as defender of Christendom. Thus, when, in 751, the Lombard Aistulf seized Ravenna, threatened Rome and meditated the conquest of Italy, Pope Stephen II (752-757), having appealed in vain for help to the emperor, turned to Pippin. He journeyed into Francia, crowned Pippin at St. Denis and, returning to Italy with the army of the Franks, received Ravenna from Pippin, who destroyed the Lombard forces (756). Charles the Great completed the conquest by capturing Pavia (772-774).

Thus the pope became a sovereign prince. His "temporal power" was the consequence of an inevitable severance of west from east, of the barbarian and Moslem invasion and of his apostolic function to maintain the faith as against the heresies and schisms which were endemic in the eastern imperial system and to evangelize the pagans of the west. Gregory I, reminding bishops that they were the salt of the earth and that, above all else, men expected of them the salvation of souls, said that "nevertheless even now there are no worldly affairs which priests do not administer" (*Liber regulae pastoralis*, 595). Pippin, son of Charles Martel, brought up by the monks of St. Denis and consecrated by St. Boniface, held much the same conception of episcopacy.

Charles the Great, after 800, was not only Augustus but "crowned of God, great and peace-bringing emperor who rules the Roman empire and who by the grace of God is king of the Franks and Lombards." He read St. Augustine's *De civitate Dei* and, admitting that the old Roman empire was the *civitas terrena*, regarded himself as governor under the Emperor of Heaven of the City of God. For 30 years (772-804) he made holy war on the pagan Saxons, and when he died in 814 his empire, extending from the Elbe to the Pyrenees, from the English sea to the Tiber, was united in so far as it was Christian. His school under Alcuin of York (735-804) was the cultural centre of this empire. Louis I the Pious, crowned at Reims by Stephen IV (816), co-operated with Pope Paschal I in his desire to convert the Danes. The archbishop of Reims, the bishop of Cambrai and a mission of monks under Anskar spread the faith about the mouth of the Elbe. A monastery was founded at Korvey (822) and a bishopric at Hamburg (831). In 826 the Danish prince Harold with many hundred followers was baptized at Mainz. Meanwhile, St. Benedict of Aniane, having reformed the monasteries of Aquitaine, was brought to advise Louis on the moral reform of the kingdom and was established in a monastery at Aachen. Under his influence the rule of St. Benedict was imposed on all monastic houses in the Frankish kingdom.

THE FORMATION OF CHRISTENDOM

At the death of Louis the Pious (840) the natural divisions of the empire and local needs, attachments and traditions were reasserted. The idea of empire derived from Rome, taught by Alcuin of York and realized by the genius of Charlemagne, receded. The invasion of the Normans or Northmen intensified the confusion of dynastic war. Based in Flanders, they ravaged Saxony, the Rhineland and France, burned Cologne, Rouen, Paris and Aachen, captured Trier, besieged Orléans, seized Bordeaux and advanced to Toulouse. They sacked the monasteries and completed the destruction of towns and communes surviving from Roman times. The Edict of Mersen (847) commanding every man to serve a lord only defined the actual situation; feudal organization was partly, if not mostly, a defense against the anarchy the Normans left behind. In 876 they settled in Normandy. Two centuries of war thus isolated and established the church in the west as the one continuous, unifying and civilizing institution and (as it were) defined its double function of evangelizing and civilizing mankind.

This isolation of the west was emphasized by the schism of Photius in Constantinople during the pontificate of Nicholas I (858-867). The elevation of Photius, a layman, to the patriarchate and the deposition of Ignatius, his predecessor, were uncanonical. On the other hand, the interference of the Roman legates in the newly founded Bulgarian church was perhaps unlawful. The *Filioque* question (the double procession of the Holy Ghost) was used mainly as an occasion, though the theological difference between east and west is implied in the dispute. As always, the west was more simply and uncompromisingly Trinitarian and laid greater emphasis on the incarnation with its consequent exaltation of the church. Nicholas I, a canonist and political realist, advanced from the traditional Gelasian doctrine of "two swords" to that which foreshadowed the papal doctrine of Hildebrand. To the emperor Michael III he wrote that, whereas the emperor needed the pope in religion, the pope had no need of the emperor in temporal matters. At the same time (865) he demanded obedience from Charles the Bald and even quashed a judgment of the great archbishop Hincmar of Reims and declared that what the pope decides all must observe. For a century, however, the Roman see, lacking temporal protection, suffered from its temporal status. The Roman nobles, the house of Spoletto, the counts of Tusculum and the kings of Germany made and unmade popes in a succession down to John XII, deposed by Otto the Great in 963.

Weakness at the centre encouraged and exaggerated the centrifugal tendencies revealed in the wide, half-civilized rural areas that were exposed to waves of pagan and barbarian invasion. The urban organization of the church in the Roman empire was not suited to this scattered and insecure continent. The church needed an imperial idea and the co-operation of temporal powers. During the 10th century the house of Saxony laid the foundations of the mediaeval empire. Cluny revived monasticism and the canon law was gradually developed; and these three factors, together with intensified theological controversy, prepared the great reform of the 11th century, which was initiated by a reformed papacy.

1. Otto the Great (912-973), occupied during the first 25 years of his reign in uniting the German peoples and defending them against Hungarians, Slavs and Normans, was crowned emperor in 962 by Pope John XII in Rome and thereafter employed in restoring order in Italy. He founded a metropolitan see at Magdeburg, whose first archbishop, Adalbert, monk of Trier and abbot of Weissenburg, had been missionary to the Russians. Bishops were founded also at Oldenburg and Havelberg (940), at Prague (976), at Olomouc (Olmütz; for Moravia) and at Odense (for Denmark; 980). In 936 St. Unni of Bremen undertook a mission to Scandinavia, where he died. The second bishop of Prague, St. Adalbert, who baptized St. Stephen of Hungary, left his see in defiance of papal and imperial injunction to preach the Gospel to the Poles and Russians, by whom he was martyred in 997. The frontier churches of Bohemia, Hungary and Poland looked to Rome rather than to Germany; and Pope Gregory V (996-999),

cousin and chaplain of Otto III, revived the missionary tradition of the Holy See but fell a victim of city faction prompted by local nobles. At his death, Otto III appointed the Frenchman Gerbert of Aurillac (Sylvester II, 999-1003). Sylvester dreamed of an empire independent of the German kings which should embody a world faith and a world culture. Like other learned men he underestimated local ties and traditions, and like other Frenchmen he failed to realize the needs of German administration. Simony he counted the greatest evil in the church. But it was much more than the "sin of Simon Magus": in France it was, indeed, a corruption which was the result of generations of insecurity strengthening the hands of unscrupulous lords; in Germany it was rooted in Teutonic and feudal custom and continued by social and economic necessity.

The spread of Christianity among remote and barbarous peoples implied local autonomy and the adaptation of ancient pagan administrative custom. Churches were built, maintained and possessed by their chiefs. The mission church was virtually autonomous; its priest was the vassal and servant, often the kinsman, of the local landowner and protected by the local saint. Clovis, the champion of orthodoxy, accepted this arrangement. In 794 the council of Frankfurt allowed churches to be given or sold so long as they were maintained. Hincmar of Reims (c. 805-882), monk, canonist and archbishop, approved the principle and wished only to reform the abuses. Bishops were imperial and royal ministers, often viceroys. The most pious of emperors, St. Henry II, employed them in every function of government and insisted on his right to appoint bishops and to control or approve episcopal elections. Bishops trained in the imperial chancery were indispensable in the administration of the empire. Pope Leo IX (1048-54) was related to Henry III and had been employed as soldier and diplomat in the imperial service. The Holy See was constantly subject to imperial interference and protection, and the great reformer, though elected at Rome, was Henry III's nominee. Thus at every level—parochial, episcopal, papal—the question awaited decision whether the church was in effect a holy, catholic and supernatural institution appointing its own bishops and priests upon its own authority or (in the language of a later age) part of the body politic.

The system evolved by nature was subject to natural corruption. The emperor Conrad II and King Philip I of France made a traffic of bishoprics. But deeper than these abuses was the question presupposed in all movements of reform of the true function of Christian priest and bishop. Councils repeatedly forbade lay interference in parochial benefices (Ingelheim, 948; Augsburg, 952; Seligenstadt, 1023; Bourges, 1031). Linked with this question was that of clerical celibacy, since a married clergy was tied by natural duties and interests to the *civitas terrena*. Marriage implied inheritance and tended to absorb the clergy in local and feudal tenancies and obligations. At the council of Pavia (1018) Benedict VIII (1012-24) denounced clerical marriage mainly on the ground that church property should not be exploited for priests' families. But there was also the question of sexual morality and the traditional attitude of the church to virginity. Celibacy was admired by Tertullian, recommended by Eusebius, required by Cyril of Jerusalem and said to be the general practice by Jerome. Epiphanius said that the church "does not admit even sub-deacons to live in marriage and beget children." Two popes, Siricius (384-399) and Innocent I (402-417), had condemned clerical marriage. Six councils in Carthage, Spain and Gaul required continence of married clergy. The Theodosian code pronounced the children of priests illegitimate. Celibacy was a tribute to the supernatural and sacramental vocation and as such was bound up with the supernatural and sacramental body which the confusion and expansion of the 9th and 10th centuries tended to obscure.

2. Monks were the exemplars and instruments of the supernatural society. It was their business to live in "the course of these declining times" as in and for the "solid estate of eternity." Monasticism (*g.v.*) was in essence a lay movement, and the multiplication of monasteries and the constant succession of monastic reforms was evidence of the hold of the Catholic faith on the lay

population. In 920 William I the Pious, count of Auvergne and duke of Aquitaine, founded Cluny. Odo of Cluny reformed Fleury and then, invited to Rome by Alberic, reformed the monasteries in and about the city and Monte Cassino. The reform spread through northern Italy and France. Cluny became the head of an order whose 300 houses, subject to the abbot of Cluny and exempt from all other authority but that of the pope, were organized in ten provinces extending from Spain to Poland. Cluny, "a spiritual field where earth and heaven meet" (Pietro Damiani), trained Urban II and Paschal II. It not only revived liturgical discipline and the Benedictine rule but realized on a world scale the practical order and common prudence of Benedictine monasticism. At the same time, Gerard of Brogne in Flanders and Dunstan of Glastonbury (d. 988) in England initiated monastic reform. In Italy St. Romuald founded the order of Camaldoli (c. 1012). In Normandy Herluin founded Bec (c. 1040), which under Lanfranc and St. Anselm became one of the great schools of Europe. There Pope Alexander II, Ivo of Chartres and Theobald of Canterbury received their training. The last wave of monastic reformation produced the Carthusian order founded by St. Bruno (1084) and the Cistercian founded by Robert of Molesme (1098). St. Bernard with the 30 companions entered Cîteaux in 1112 and with 12 monks founded Clairvaux in 1115. He was the "greatest of the monks" and one of the greatest preachers of the middle ages.

3. Canon law (*q.v.*) derives from the Scriptures, conciliar canons, papal decrees and traditions and customs of the church. In the west it developed later and more slowly than in the east. In 774 Charlemagne received from Pope Adrian I a collection of canons and decretals accepted at the council of Aachen (802) by the Frankish church. Under the see of Toledo the Spanish church possessed a larger collection including canons of Greek, African, Gallic and Spanish councils and papal decretals. In the 9th century also appeared the collection of "false decretals" whose forgery was not detected until the 15th. This collection, containing both real and spurious decretals, circulated in Spain, Italy, France and even England but was not much used in Rome till the 12th century. Collections made by Burchard of Worms (1012-23) and Ivo of Chartres (c. 1040-1116), Lanfranc's pupil at Bec, prepared the way for Francis Gratian's great work. Gratian, or Gratian, a Camaldulan monk of Bologna, produced the *Decretum* (1139-41), a systematic treatise (*Concordia discordantium canonum*) in three parts dealing with (1) sources of law and ecclesiastical persons; (2) jurisdiction, procedure, property and marriage; and (3) consecration, sacrament and liturgy. During the 12th and 13th centuries five compilations were added. Gregory IX added the decretals of popes since the *Decretum* which were compiled by the Dominican Raymond of Peñafort. Later decretals were collected by Boniface VIII (1298) and Clement V (1314); and the *Extravagantes* (decretals not included in previous compilations) brought the law down to Sixtus IV (1484). These together formed the *Corpus juris canonici*, of which a definitive edition was issued by Gregory XIII in 1582.

4. St. Augustine developed his doctrine of the church against the Donatists and his doctrine of grace against Pelagius, but both doctrines were already full-grown, and the fundamental reason for his exposition lay in the need of the man Augustine, a sinner in need of grace and the citizen of a dying civilization in need of the City of God. In other words, the power and permanence of Augustinian theology was the result of his factual presentation of man as man in relation to his Maker and Saviour. The west, untroubled by the complicated disputes and theological parties of the east, developed its theology in simple and universal terms, not as a theory so much as a faith. At the council of Orange (529) under Pope Boniface II the Semi-Pelagians were condemned: "If anyone shall say that by the prevarication of Adam it was not the whole man . . . that was changed for the worse but that, while his soul's free will remained untouched, the body alone became the victim of corruption, such a man is misled by the errors of Pelagius." The question of predestination and depravity was raised in the 6th century by Gottschalk, a monk of Fulda, whose doctrine of a double predestination was condemned by Hrabaneus

Maurus of Mainz and Hincmar of Reims. But the doctrine of grace developed more surely and continuously as the doctrine of the Eucharist, and here also the church insisted on the reality of the sacrifice. For Ambrose it is Christ Himself who offers the sacrifice and changes the elements into His body and blood. For Augustine the church presents itself as a whole and living sacrifice. Gregory says that the daily offering of Christ's body and blood avail for salvation and that by this means "the lowest things are united to the highest, things earthly are joined to things divine and the visible and invisible become one." In the 9th century Paschasius Radbertus, monk and abbot of Corbie, wrote a treatise *De corpore et sanguine Domini*, which in 844 he presented to Charles the Bald, emphasizing the fact of the real change into the body and blood of Christ and equating the daily sacrifice with daily redemption. Another monk of Corbie, Ratramnus, at the same time described the sacrifice as "spiritual" and discussed the relation of "figure" and "truth" in a work afterward attributed to Johannes Scotus Erigena and condemned during the Berengarian controversy at Vercelli in 1050. Berengarius, *scholasticus* and archdeacon of Tours (d. 1088), outlined his doctrine in a letter to Lanfranc, and in 1080 Lanfranc set forth the orthodox doctrine in his book *De corpore et sanguine Domini*.

The Christology of the western church was settled at Chalcedon. The Adoptionist heresy of Felix, bishop of Urgel (c. 783-799), and Elipandus of Toledo (d. 808) was condemned at Narbonne (791) and Regensburg (792) and answered by Alcuin of York, who said that the sonship of Christ is not of nature but of person: the divine and human natures are united in the person of the Son. During these centuries the west developed the devotion to the Virgin Mary defined at the council of Ephesus (431) and at Constantinople (553): "If anyone shall say that the holy, glorious and ever-virgin Mary was only in a certain sense and not most truly the Mother of God, or that she was so in some merely relative way as though it were simply a man that was born and not the Word of God that became incarnate and was born of her, or shall refer, as some do, the birth of the man to God the Word only in the sense that the Word was with the man when he was born . . . let him be anathema." In the 4th century St. Gregory of Nazianzus had written that "if anyone does not believe that Holy Mary is the Mother of God, such an one is a stranger to the godhead"; and in the early 8th century St. John of Damascus (c. 676-c. 754) eloquently proclaimed the doctrine of her bodily assumption. Pope Sergius I decreed that the litanies be held on the four feasts of Our Lady, and Pope Leo IV gave the feast of her "Falling Asleep" a vigil and octave. It is mentioned in Adrian I's sacramentary and commanded in the laws of Alfred. The devotion to the Mother of God became articulate and instituted as the doctrine of the incarnation was defined. The same uncompromising refusal to adapt the central mysteries of the faith or to modify them in the interests of rationalization appears through all the centuries of Christological dispute and social chaos. The sacrifice is a real sacrifice, the Saviour really present, the incarnation the real fullness of the godhead bodily, the church the really divine-human community and its head the real and effective sovereign, vicar of Christ.

This realism, the mark of Christian orthodoxy, is the heart of the work of St. Anselm (1033?-1109). His use of the ontological argument is thus the opposite in emphasis of the Cartesian: its essence is the emphasis on existence. His *Cur Deus homo* starts from divine justice, and his argument presupposes its absoluteness. Faith is the foundation of reason. The same unyielding realism of faith was expressed in the papal reform initiated by Leo IX (1048-54): "The head of the entire discipline of the church is in that place where Peter, the summit and cardinal member of the apostles, waits for the blessed resurrection of his flesh in the last day." Leo IX had learned administrative method in the imperial service and his episcopal duty in a poor diocese. During the first two years of his pontificate he held 12 councils. He travelled to Reims, to Mainz and as far as Hungary, organized the papal chancery to sustain a large correspondence, employed legates like Adalbert of Bremen and Humbert of Moyenmoutier and created a college of cardinals. He dreamed of the reunion of east

and west. He brought to Rome young Hildebrand (Gregory VII), who had known the city's disorders as a boy and who devoted the remaining 40 years of his life to the reform. Stephen IX (Frederick of Lorraine) was already dying when he left Monte Cassino for the chair of Peter, but in his few months he consecrated the monk St. Pietro Damiani (Peter Damian) cardinal bishop of Ostia, secured the co-operation of cardinals and Roman burghers to ensure the canonical and independent election of his successor and enjoined upon them to await the return of Cardinal Hildebrand, then in Germany. Stephen was no sooner buried than the Roman nobles proved his wisdom by electing an antipope whom the cardinals excommunicated, appointing the Burgundian bishop of Florence, Nicholas II. At his death (1061) the struggle came to a head between the reforming cardinals and the bishops of Lombardy led by Milan. The cardinals elected Anselm of Lucca, Lanfranc's pupil at Bec, as Pope Alexander II. But it was only after bloodshed and an appeal to the German court at Augsburg, and even then at the risk of his life, that Alexander began his pontificate. Nevertheless, the reform was already visibly changing the relations between church and state.

Gregory VII (1073-85), who as monk, deacon, cardinal and pope served this cause for 40 years, was perhaps alone in his vision of all its meaning as, after 1072 (when Pietro Damiani and Adalbert of Bremen died), he was the sole survivor of Leo IX's circle of reformers. For him the battle was no longer limited to simony and celibacy. Likened by his contemporaries to the prophet Elijah, he was disinterestedly certain that the pope is the voice and speaks with the authority of Peter and claimed absolute authority over the souls of Christians without misgiving and without arrogance. Italian, not German, a monk trained in the service of the papacy, elected by cardinals and acclaimed by the people of Rome, he had never been a bishop until he was made pope. As legate he had seen the church in France and Germany with the eyes of central authority. The arch-chancellor of the empire, who was also archbishop of Mainz, complained that Pope Alexander II had dealt directly with his suffragans of Prague and Olomouc instead of dealing through their archbishop. Liemar of Bremen refused to act at the orders of papal legates without consulting the German episcopate. Secular clergy revolted against a decree of celibacy. Only the Saxon bishops supported the pope, and that because they were opposed to the emperor. In 1075 Gregory revealed his determination: he suspended the archbishop of Bremen and the bishops of Bamberg, Speyer, Strasbourg and three Italian sees and threatened five imperial councillors with excommunication. Henry IV, the German king, having subdued the Saxons, was free to attack the pope. In 1076, at a council of German bishops held at Worms, he declared Gregory deposed and the north Italian bishops declared their agreement. Gregory then deposed and excommunicated the German and Lombard bishops who had signed Henry's letter, declared Henry deposed and excommunicate and his subjects absolved of their allegiance. The effect of this open clash was Henry's defeat and isolation, which he saved from complete disaster by submitting to Gregory at Canossa. There he did penance and awaited absolution, which Gregory gave in duty as a priest. The absolution disconcerted the papal party in Germany which had elected Rudolph of Swabia king in Henry's room. But now Gregory, who was not a partisan, remained neutral. Three years of civil war ended with the victory and death of Rudolph and the excommunication of Henry, who marched on Rome and was crowned by Gilbert of Ravenna (the antipope Clement III). Gregory, "having loved righteousness and hated iniquity died in exile" at Salerno, the guest or prisoner of Robert Guiscard, the Norman king of southern Italy. In France, his campaign against simony and clerical marriage had been more successful. In England, Lanfranc carried out his policy but with a characteristic independence. "Our island," he said in a letter refusing to side with the emperor, "has not yet disavowed Gregory VII nor given judgment whether it ought to obey Clement III." In Spain, Gregory claimed temporal as well as spiritual authority and induced the Spanish church to institute the *Ordo Romanus*. He sent legates to Poland and claimed Hungary as the gift of St. Stephen to St. Peter.

Urban II (1088-99) inherited Gregory's exile and carried on his work. A monk of Cluny and a canonist, he had been employed as legate in Germany to organize the papal party. More firmly than Gregory he maintained the opposition to lay investiture and required free and lawful election of bishops. Deprived at first of his centre at Rome, he held a number of councils. At Clermont (1095) he forbade clergy to do homage to laymen and proclaimed the first crusade (*see* CRUSADES), which, apart from its particular occasion and important results, inspired the first great movement of popular preaching. Urban employed permanent legates, encouraged appeals to Rome, graded the hierarchy and confirmed the privileges of monastic houses, exempting many of them from episcopal control. At the same time the emergence of an international school at Paris recovered scientific theology for western Christendom. William of Champeaux (c. 1070-1121) established the reputation of the cathedral school. Peter Abélard (1079-1142), who had studied under William, made it the most famous school in Europe and, using the *Organon* of Aristotle, laid the foundation of its tradition as a school of logic and philosophy. The university was the peculiar care and favoured nursing of Innocent III, who secured its independence, finally established by Gregory IX in 1231. At Paris the study of civil law was forbidden (1219) by Honorius III, perhaps in favour of Bologna, where it was well established (in succession to Ravenna and Rome) in the 11th century, and perhaps to ensure the study of theology at Paris. By the middle of the 13th century the schoolmen of Paris had access to original translations from the Greek of nearly all Aristotle's extant works. Forbidden by the legate, Robert de Courçon, in 1215 and again in 1231 and 1263, the physical and metaphysical works of Aristotle, together with the commentaries of Averroes, were nevertheless read and studied especially by the Dominicans Albertus Magnus and Thomas Aquinas, whose Aristotelian method was to become the orthodoxy of Catholic exposition. (*See* SCHOLASTICISM.)

At the fourth Lateran council (1215) Innocent III (1198-1216) published a definition of the faith which, after affirming the doctrine of the Trinity, the Incarnation and the Judgment, says:

There is moreover one universal Church of the faithful, outside which no man at all is saved, in which the same Jesus Christ is both the priest and the sacrifice, whose body and blood are truly contained in the sacrament of the altar under the species of bread and wine, the bread being transubstantiated into the body and the wine into the blood by the divine power, in order that, to accomplish the mystery of unity, we ourselves may receive of His that which He received of ours. And this thing, the sacrament to wit, no one can make (*conficere*) but a priest, who has been duly ordained, according to the keys of the Church, which Jesus Christ Himself granted to the apostles and their successors.

But the sacrament of baptism, which is consecrated in water at the invocation of God and of the undivided Trinity, that is of the Father, and of the Son and Holy Spirit, being duly conferred in the form of the Church by any person, whether upon children or adults, is profitable to salvation. And if anyone, after receiving baptism, has fallen into sin, he can always be restored (*reparari*) by true penitence.

Not only virgins and the continent, but also married persons, deserve, by right faith and good works pleasing God, to come to eternal blessedness. (Cited by Alexander Hamilton Thompson, *Cambridge Medieval History*, vi, p. 635.)

The last article of the definition quoted above refers to the Catharist or Albigensian heresy, which in the 12th and 13th centuries threatened large areas of Hungary, Germany, Italy and France. It rejected infant baptism, purgatory, the communion of saints, the use of images and the doctrine of the Trinity. Above all, the Cathars attacked the institution of marriage, which was the basis of all social custom and law, sacred and secular, in the west. Catharism was anarchy and heresy at once. It implied the complete subversion of the social structure and the complete denial of the Christian faith. Its leaders, *perfecti*, admitted no obligation, moral or material. In Languedoc the crusades inaugurated by Innocent III against the heresy were eagerly supported by the French nobility (1209-44). At the same time the Inquisition was organized. Proposed at the council of Verona (1184) and established early in the 13th century, this court was designed to combine judicial procedure with propaganda. Under Gregory IX it was organized with specialist judges and advisers. Its activity varied with time and place. In England and Portugal

it was unknown. In Spain it was obsolescent during the 13th century but revived under Ferdinand and Isabella. In Germany its vigour waned between 1350 and 1350. It was most vigorous in France. As a rule its methods were laboriously and punctiliously just, though it could be misled and sometimes, as under Ferdinand and Isabella, was used for political ends. In an age whose most important industry was definition, in which social discipline and civilized living had still to be won, there could be no question of indifference. The enemies of faith were the enemies of man.

The 13th century was the age of an apostolate at every level of human life. The leaders of the movement were friars, orders initiated by laity (St. Francis) and the lower ranks of clergy (St. Dominic) under the immediate protection of the pope. In 1210 Innocent III sanctioned the Franciscan rule. In 1216 his successor, Honorius III (1216-27), took under his government and protection "the order of Master Dominic and Friars Preachers." The Franciscan movement was popular and spontaneous and as such reflected the social movement, the learning and the spirituality which developed in centres of population. The Dominicans, a learned order from the beginning, where Augustinian canons called to preach by the spread of heresy and the demand for instruction in the faith. In Raymond of Peñafort, their third master general (1238-40) and confessor to Gregory IX, they produced the greatest canonist and constitutional lawyer of the age. The Swabian Albertus Magnus (c. 1200-1280), their regent master in Paris, "strove to make Aristotle intelligible to the Latins" and shares with his contemporary, Robert Grosseteste (1175-1253), bishop of Lincoln, the title of "father of modern science." His pupil Thomas Aquinas is still the "common doctor," the greatest teacher of the Roman Catholic Church. Leo XIII in the encyclical *Aeterni Patris* (1879) required bishops "to restore the wisdom of St. Thomas and to spread it as far as possible for the safety and glory of the Catholic faith, for the good of society and for the increase of all sciences." It was the work not only of St. Thomas but of the 13th century as a whole to synthesize those three purposes.

In Paris, the metropolis of theological and philosophical controversy, and at the moment of the full recovery of Aristotelian method, St. Thomas (see AQUINAS, THOMAS) represents the arrival of scientific intelligence and the discovery by Christendom of the nature of man. His work is the first clear articulation of the full human confidence in human nature which in patristic and conciliar definitions, as in the earlier scholasticism of St. Anselm and in the preaching of St. Bernard, was still overshadowed by theological controversy and ecclesiastical purpose. St. Thomas realized what neither pagan philosophy nor Christian theology had as yet clearly discerned, the naturalism of supernature, the divine right of man.

The last end of man is the contemplation of truth. This alone is distinctive of his nature, and no other corporeal being shares it with him. Nor is there any end beyond it, for the contemplation of truth is an end in itself. Hereby man is united in likeness with superior spirits, because this alone of human activities is an activity of God and the angels as well. . . . And to this end all other activities seem to be directed. For perfect contemplation we require bodily health, which is secured by all such arts as are necessary to life. We require freedom from perturbation of the passions, a goal obtained by the moral virtues and by prudence. We require freedom from external perturbations, a freedom at which the entire organization of civil government aims. So, if you look at the matter rightly, all human occupations appear to be directed to the needs of those who contemplate the truth. (Reprinted from the *Somma Theologia* with the permission of Benziger Brothers, Inc., publishers and copyright owners.)

This coherence of economy, morals and politics in the contemplation of truth is the pattern of Catholic humanism, derived from Catholic faith in the union of human nature with the divine, by which the trial and error of subsequent history of Christendom is judged and to which man progresses and from which he falls.

Whether the claim of Nicholas I, Gregory VII and Innocent III to an effective sovereignty of Christendom was theoretically sound or not, the civilization of the west did in fact cohere in the church which cohered in the papacy. The papal victory of the 12th century, the development of law, theology and ecclesiastical order, had made the Holy See the centre of a judicial and adminis-

trative system not only more efficient than any other government but the basis of all government. It was the final court of appeal in international dealing, the source and standard of ministerial and judicial competence. The pope's authority was also popular and moral. Innocent III (*q.v.*), feudal suzerain of a large part of Europe, exercised also as head of the church a direct and real authority over its chief administrative officers, the bishops, and over the real religion of its people. He and his successors created the universities which trained public servants and presided over an international court in which every sovereign in Europe was prepared to plead. The distance between the papal and the imperial conceptions of government is illustrated in the 12th century by comparing the practical genius and personal ascendancy of Frederick I Barbarossa on the imperial side with the almost impersonal patience and judicial science of Alexander III on the papal. Both were just men, but, whereas Frederick conceived his office in terms of Otto the Great and Charles the Great, imposing peace on his vassals, making war for the dream of a Roman empire and doing personal justice which made offenders tremble at his coming, Alexander III made decisions, worthy of Gratian's pupil, which became part of the permanent system of canon law. The third Lateran council, with its successor under Innocent III, defined a conception of life and society which still endures. Frederick's use of the civil law and comparison of himself with Constantine and Justinian as lord of the world at the diet of Roncaglia (1158) was a soldier's romance which never became even plausible and was finally shattered by the Lombard cities at the battle of Legnano (1176). But even the Angevin Henry II of England was compelled like his Norman predecessors to submit to the authority of an order which needed no armament because it was inherent in the social structure.

THE CHURCH AND THE NATIONS

The converse was also true. The papacy reflected Christendom and reacted to the national, social and cultural revolution of the 13th and 14th centuries. Frederick II of Hohenstaufen was the first secular sovereign of the modern kind. He ignored without resenting the papal excommunication and was equally prepared to hand Germany over to the church (by the *privilegium in favorem principum ecclesiasticorum* of 1200), to make friends with the sultan of Egypt (1229) and to crown himself king in Jerusalem which he had sworn to protect. Having shocked German opinion with his harem and his Saracen bodyguard, he established a central court of justice (diet of Mainz, 1235) and attended the translation of the bones of St. Elizabeth of Hungary (canonized 1234) to Marburg. His greatest achievement, the constitution of Meli (1231), drawn up in defiance of the pope, established an enlightened despotism in the Sicilian kingdom. His University of Naples, too, was a despotism governed by a royal chancellor. His friend and fellow-heretic Hermann of Salza used the Teutonic order to found the military state of Brandenburg (1230) which developed into the modern kingdom of Prussia.

France enjoyed peace and consolidation under Louis IX, who valued his throne as a means of making Christians. Provence was united to France in 1246 and the English expelled from all France save Gascony in 1259. The military adventures of the English Edward III and Henry V, picturesque rather than political, served, as did the wars of Burgundy and Armagnac, to confirm the French nationality which Louis XI (1461-83) centralized in the throne. By the 14th century the vernaculars of Italy, France, Spain, Germany and England were mature, their legal systems organized. They were aware of commercial rivalries and of national ambitions. Feudalism was dying. The Italian cities of Venice, Florence and Milan were independent powers. The age of the crusades was passing; that of national states had arrived.

The Holy See reflected this revolution. It became the centre of Italian politics and international diplomacy, subject to international intrigue. Its judicial business was extended. From increasingly secular states it demanded increasing revenues. Nicholas III (1277-80) was a political realist; he accepted the situation in which every cardinal was the agent of a political interest, and he exalted his own family, the Orsini. His successor, Martin IV,

a Frenchman, was the creature of Charles of Anjou. Honorius IV (Savelli) raised his family against the Orsini. Nicholas IV (Colonna) balanced the other two. Then the cardinals sought to remedy the corruption and forced a hermit unacquainted with the world into the chair of Peter; Celestine V survived five months, was persuaded to abdicate and died in prison. His incompetence was less disastrous than the ability and ambition of his successor. When Boniface VIII, pursuing the logic of contemporary politics and Roman law to an extreme, forbade clergy to pay taxes to the secular government (*Clericis laicos*, 1296), Philip the Fair forbade the export of money from France. When Boniface claimed Scotland as a fief of the pope, Edward I annexed it to England. Both kings relied on their national assemblies, Edward I on the parliament of Lincoln (1301), Philip the Fair on the states-general (1302). Finally French troops seized and imprisoned the pope, who died in 1303. His successor Benedict XI denounced the outrage and died in a few weeks—of poison, it was said.

The next election took ten months and the next pope, Clement V, archbishop of Bordeaux, transferred his court to Avignon in 1309. The "Babylonish captivity" had begun (*see* PAPACY). Perhaps the most dramatic as it was the most shameful sign of the changed time was the suppression by Philip IV and Clement V of the Knights Templars (whose constitution had been drawn up by St. Bernard) after a trial of extorted confessions in which the slanders were dictated by Philip's agents and then confirmed by his victims under torture. The real offense of the Templars was that with the decline of the crusades they had taken to banking; a form of usury which evoked the resentment of their noble debtors and the greed of the king. The "Great Schism" which started in 1378 with the election of Robert of Geneva as Clement VII in opposition to the reigning Urban VI was the final tribute of the papacy to national rivalry. Nations bargained with one side or the other.

The doctrine which accompanied, explained and defended the new order was nominalism, which denied the reality of universals and declared it an "error to believe that there is something in reality besides the singular entity." Thus there is no such thing as the nature of man which could be defined and must be obeyed and which might be united to the divine nature in the person of Christ; there were only individual men, and the definition of human right and duty was promulgated and enforced by the prince. Nature and supernature, reason and revelation thus parted company. Natural science, whether legal, empirical or mathematical, could thus be rid of metaphysical assumptions and set free to handle facts and concepts each on its own terms. The prince was the source of rights and obligations and, in the words of John Wycliffe (*De officio regis*, 1379), was above human laws. The doctrine was expounded by those Franciscans who supported Louis the Bavarian (1314-47) in his claim to the empire as Louis IV. Marsilius of Padua and John of Jandun affirmed the absolute authority of the civil power (*Defensor pacis*, 1324). The papacy was a human institution which had usurped power. Henry of Langenstein and Conrad of Gelnhausen (1380) thought that a council is above the pope. Wycliffe's opinions, condemned in England, found a home at Prague and a more attractive apostle in John Huss, whose preaching in the Bethlehem chapel kindled the national imagination. Huss proclaimed the doctrine of Germany for the Germans, France for the French, Bohemia for the Bohemians. The council of Constance which condemned him adopted this principle at the suggestion of the bishop of Salisbury as the basis of voting and thereby defeated John XXIII's Italian majority. The conciliar movement (Pisa, 1409; Constance, 1414-18; Basle, 1431-38) represents an attempt to establish a parliament of Christendom or perhaps a league of nations. The decree *Frequens* declared that councils ought to be held every five years. At Basle the intention was even more explicit to make the pope the constitutional sovereign or nominal head of a Christendom whose national sovereigns were absolute.

The assembled doctors were not in a position to admit what was clear to the governments represented, that their authority was without foundation.

REFORM AND DEFINITION

Meanwhile the humanism of the Renaissance and a wide and increasing practice of mysticism intensified individual religion and magnified the individual person. At length the revolution broke. It is symbolized in three events. In 1517 Martin Luther nailed his theses on the door of the church at Wittenberg. In 1534 the Act of Supremacy proclaimed Henry VIII supreme head on earth of the Church of England, which he described as "part of the body politic"; in 1535 John Fisher, Thomas More and the London Carthusians were martyred. In 1543 was published the treatise *De revolutionibus orbium coelestium* of Nicolaus Copernicus. All three events in their several kinds were acts of revolt and signs of exodus into the unknown from the given and created world which Christianity presupposed. "It is not necessary," said Copernicus, "that hypotheses should be true or even probable. It suffices that they lead to calculations which agree with observations." "By reformation," said Luther, "I do not mean the reform of this human teaching and spirituality; I mean its complete and absolute abrogation." "The true significance of the Copernican revolution consisted not so much in displacing the world's centre from the earth to the sun as in implicitly denying that the world has a centre at all." (R. G. Collingwood, *The Idea of Nature* [Oxford, 1945]). In like manner the princes denied the organic unity of Christendom. The doctrine *Cujus regio, ejus religio* (first announced at the Recess of Speyer, 1526) was adopted throughout Germany by the diet of Augsburg (1555) and then throughout Europe, Catholic and Protestant. In 1572 Catherine de Médicis answered the English protest against the St. Bartholomew massacre by proposing that Elizabeth should use the same method with Catholics. In 1593 Henry of Navarre "bought Paris with a Mass." The supreme artist in this secular statecraft is Cardinal Richelieu.

Reform of the church began under Leo X (1513-21). In Italy the Theatines (1524) were founded to reform parochial clergy. In 1526 Matteo de' Bessi founded the Capuchin branch of the Franciscans, and in 1530 the Barnabites were founded by St. Antonio Zaccaria. Paul III (1543-49) began the Counter-Reformation by appointing reformers—Giovanni Pietro Caraffa, Gasparo Contarini, Jacopo Sadoleto, Reginald Pole—to the sacred college. In 1536 they served with five others on a commission which urged the need for reform and did not spare the abuses. In 1534 St. Ignatius of Loyola and six others initiated the Society of Jesus (*s.v.*), established in 1540 by the bull *Regimini militantis ecclesiae*. In 1542, by the bull *Licet initio*, Paul III established the papal Inquisition under Caraffa's influence to supervise the whole church. Pius IV and Pius V enlarged its powers, and Sixtus V (1585-90) reorganized it as one of the Roman congregations. In 1545 a general council met at Trent, which was postponed indefinitely in 1547. It reassembled (1551-52) under Julius III and met again, finally, in 1563.

Trent was nothing that Constance had been, everything that Constance was not. Constance had seen the triumph of nationalism; Trent ignored it. Constance made no definition of the faith; Trent made nothing else. Constance had deposed the pope; Trent left everything in his hands. Convoked at the will of Paul III and interrupted by war, Trent made no pretense of gathering or expressing the will of Europe. It reformed the church and accepted the world. It recovered the centre which the movement and confusion of powers had displaced and obscured. Its answer to the theology of the Reformation was an affirmation of the divine-human unity: "In justification a person receives infused through Jesus Christ the remission of his sins, faith, hope and charity. For faith, unless there is added to it hope and charity, does not perfectly unite a person with Christ; nor does it make him a living member of His body; whence it is most truly said that faith without works is dead and unprofitable." (*See* TRENT, COUNCIL *or.*)

The works were not lacking. The Counter-Reformation inaugurated above all an age of sanctity: the cardinal archbishop of Milan, St. Carlo Borromeo (1538-84); the Florentine priest St. Philip Neri (1515-95), whose Oratory founded in 1564 in Rome transformed the city; St. Francis of Sales (1567-1622), the most lovable of the doctors of the church, whose devout humanism and

humane devotion influenced not only the Catholics of his century but Catholic and Protestant Christianity thereafter; St. Theresa of Avila (1515-82); St. John of the Cross (1542-91), the greatest of the mystics; and St. Vincent de Paul (1576-1660).

Nothing like the apostolate of the Jesuits had yet dawned on the Christian imagination. Within two years of the society's foundation, St. Francis Xavier under the patronage of John III of Portugal established a mission at Goa and during his ten remaining years of life made thousands of converts in India, Malacca, Amboina, the Moluccas and Ceylon (where the king of Kandy and many of his subjects were baptized); he founded a mission in Japan and was on the point of entering China when he died. At the same time Alfonso Salmeron, afterward the colleague of Peter Canisius at Ingolstadt (1549), was sent to Ireland with orders from Paul III "to be all things to all men, constant in good deeds, and to win souls by kindness." In 1542 the Jesuits were established in Bavaria. They were invited to Salzburg, to Mainz and to Osnabrück. Having carried the Counter-Reformation down the Danube and the Rhine, they were called to assist at Trent. They invaded Poland in 1570, England in 1580, Switzerland in 1586. In 1609 they took over the government of Paraguay and turned it into a perfect, almost too perfect, model of Christian social organization. In 1611 they arrived in Canada. Their Roman college, founded in 1551, was the mother of the greatest educational enterprise Christendom had ever known. In 1565 their College of Clermont was already disputing with the University of Paris, whose Gallican doctors had reason to fear their democratic and ultramontane doctrines. They were among the pioneers of patristic study. They quickly became and for two centuries remained the schoolmasters *par excellence* of Catholic Europe; their *ratio studiorum* laid down in 1585 and revised in 1599 survived till 1832, and among their pupils they number men who attained every variety of fame—Ferdinand II and Leopold I, Tilly and Wallenstein, St. Francis of Sales and St. John of the Cross, René Descartes and Molière, Pierre Huet and Jacques Bossuet, Pierre Bayle and Mazarin, Voltaire, Giovanni Vico and Denis Diderot. Placed under the direct command of the pope, they were the natural foes of national autonomy. At Trent they supported the doctrine of episcopacy *lege ecclesiastica*, which placed national bishops under the see of Rome as against episcopacy *jure divino*, which would have established their national independence. Hence they stood opposed to the Gallican ambition represented by the Paris *parlement*, the university and the Bourbons. Confessors of popes and princes, they were exponents of the "rights of man"; Juan de Mariana's treatise *De rege et regis institutione* (1599), dedicated to the future Philip III of Spain, lays its stress not on the legitimacy but on the justice of the king. It offended public opinion above all in France by defending tyrannicide. The church is the perfect society.

The splendour of French culture in the 17th century was the fruit of Catholic humanism and national self-consciousness. Gallicanism (*g.v.*) was another consequence of the union of church and nation. The relations of the Gallican church with the Holy See were defined by the concordat of 1516. The same principles of Gallican independence were affirmed in Bossuet's articles in 1681 and spread in the 18th century to the rest of Catholic Europe. The Jansenists, whose doctrines were condemned in 1713 by Clement XI in the bull *Unigenitus*, joined the Gallican cause against the "ultramontane" influence of the Jesuits. In 1763, when the French Jesuits were being suppressed, Febronius (J. N. von Hontheim), auxiliary bishop of Trier and pupil of the Jansenist canonist Z. B. van Espen of Louvain, published his treatise *De statu ecclesiae et legitima potestate Romani pontificis* maintaining the subordination of the pope to general councils and the independence of bishops. Condemned in 1764, the book circulated throughout Catholic Europe. In 1766 the ecclesiastical electors jointly protested against "papal usurpation." Joseph II (on the death of Maria Theresa, 1780) carried out a Febronian policy in the Habsburg empire. In 1773 Clement XIV was forced by the governments of Portugal, France, Spain and Naples to suppress the Society of Jesus. By 1793 the French monarchy was dead, the aristocracy abolished and an egalitarian republic was preparing to

establish the rights of man starting from the year I. The *Constitution civile du clergé* (1790) was a Gallican measure. The concordat of 1801 restored the terms of 1516.

During this century of anticlerical princes and antipapal bishops was founded the Feast of the Sacred Heart (1765), the order of Passionists by St. Paul of the Cross (1694-1775) and the Redemptorists by Alfonso Maria dei Liguori (1696-1787).

THE MODERN WORLD

Napoleon passed like a storm and left Europe in ruins. Industrial revolution and economic determinism created a new absolute of natural necessity. The philosophers of reconstruction, idealist or utilitarian, were alike determinist. J. G. Fichte deified the state; G. W. F. Hegel identified God with history; T. R. Malthus and David Ricardo regarded man as the slave of natural forces. Determinism was presupposed in theories of *laissez faire* and of the absolute state, materialism loudly proclaimed by the apostles of revolution and unconsciously generated by the preoccupations of scientific industry and efficiency. Such were the elements and climate of liberalism. Joseph de Maistre opposed it; H. F. R. de Lamennais tried to capture it. In 1834, while Giuseppe Mazzini was founding Young Europe in the name of God and the people, J. B. H. Lacordaire drew crowds of young men to his *conférences* in Notre Dame with a similar message. In 1837 a German ultramontane movement under Joseph von Görres sprang to life when the Prussian king imprisoned the archbishop of Cologne and other bishops for refusing to compromise on mixed marriages. Louis Veuillot founded *L'Univers religieux* as the organ of French ultramontanism in 1843. In 1843 also Vincenzo Gioberti's book *Del primato morale e civile degli Italiani* attempted to claim national sentiment for the church: he proposed that the pope should head a confederation of Italian states.

It was not through such political enmities and affinities that the Catholic revival took place. The attitude of the church puzzled its friends and enemies alike so long as they thought of it as a party or a policy, one among many contending for authority to solve political problems. The return of Pius VII from Fontainebleau to Rome was a triumph. Whole towns came out to do him honour; kneeling crowds lined the roads. It was a spontaneous gesture and expressed a piety deeper and older than the policies and theories which transformed European government. In 1848, when Europe was in revolution, Pius IX at Gaeta was visited by a priest who had begged his way from Subiaco whither he had walked a few months earlier from Pontigny, his purpose to ask the pope's approval (willingly bestowed) on the foundation of a religious house. Then he walked back to France and, in the forest near Sens, built a hut with chapel, kitchen and dormitory where, with two companions, he lived in extreme poverty according to the Benedictine rule. Four years later he died. The community, which had become the mother of seven others in France, Palestine and America, was driven from France in 1882, took over the ruins of Buckfast and erected one of the most renowned of modern abbeys. This Jean Baptiste Muard was a child of peasants reared in poverty. So was Giovanni Bosco, whose work among the youth of Turin, begun in 1847, elicited the respect and won the support of the government and who founded the Salesian order which was approved in 1874. So was Jean Baptiste Vianney, who became the *curé* of Ars in 1818, and so was Giuseppe Sarto, who became Pope Pius X. In the fall of the monarchies, the decay of aristocracies and the advance of secularism among the intellectuals, the revival of the church sprang from the devotion, the family life and the personal sanctity of the poor. Theirs was the mind which Pius IX, an indifferent politician and a great bishop, represented and understood. Poverty, chastity and obedience, the ancient prescription for the Christian life, were also the condition of social vitality and the answer of the Catholic people to the proletarian or capitalist theories of the secularist doctrinaires. They presuppose a universal humanity. But except as functions of a dismembered humanity, the politics and economics of power were meaningless, while for deity they substituted a religion of individual, national and class emancipation and enlargement. In 1848 this ancient adversary of the church appeared in Rome and demanded a liberal

pope to lead a nationalist cause, Catholic Italy against Catholic Austria; the pope fled to Gaeta. The movement carried on these secularist assumptions mastered European politics, and the pope became the prisoner of the Vatican. In 1854 he defined the Immaculate Conception, the consummate affirmation of faith in human nature. Another statement of the same faith, sorely needed in the age of Nietzsche, appeared in the Vatican constitutions (1870). "The Holy Church, our mother, holds and teaches that by the natural light of human reason, God, the principle and end of all that is, may be known with certainty through the medium of created things. . . . If anyone shall say that the only and true God, our Creator and Lord, cannot be known with certainty by the natural light of human reason, let him be anathema." At the moment of Bismarck's victory the pope defined the dogma of papal infallibility. Together with the dogma of the Immaculate Conception and the Dogmatic constitutions it defined the structure of Catholic humanity against the drift and scepticism of progress and power condemned in the syllabus of 1864. Forty years later Pius X began his pontificate, "taking courage in Him who strengtheneth us to proclaim that we have no other aim but that of restoring all things in Christ, so that Christ may be all in all" (*E Supremi apostolatus*, 1903).

The word "ultramontane" belongs to an age of territorial dominion. With the loss of the papal states it passed into history. The war of ideologies began. In 1872 Bismarck launched his *Kulturkampf*. In 1873 the May laws inaugurated a policy of nationalization. The Catholic bureau in the ministry of education was abolished, schools placed under state inspectors, seminaries under state control and, as the war proceeded, many of the bishops imprisoned. Rudolf Virchow, the radical, invented the name *Kulturkampf* to mark the real conflict not between church and state but between two civilizations fundamentally opposed. Resisted not only by Catholics and the centre but by the court, the conservatives and the Lutherans, the policy failed. By 1887 the *Kulturkampf* was over in Germany. It was beginning in France. The Italian governments of left and right, unable to cope with economic distress, suffered continual disorder, and the forces of communism and socialism increased. Leo XIII, who succeeded Pius IX in 1878, issued a series of encyclicals on social and political questions which were accepted through the whole church as a classical statement of its principles: *Inscrutabile Dei* (1878), on social evils caused by rejecting the church, *Quod Apostolicus numerus* (1878), on socialism, communism, nihilism; *Arcanum divinae sapientiae* (1880), on marriage; *Diuturnum illud* (1881), on civil power; *Immortale Dei* (1885), on church and state; *Libertas* (1888), on liberty; *Sapientiae Christianae* (1890), on citizenship; *Rerum novarum* (1891), on the social order.

The French attack on the church, restrained after 1870, was brought to a head in 1900 in reaction to the ultramontanism of the army and in response to an intelligentsia of liberals and Freemasons. In 1901 the Law of Associations dissolved two-thirds of the religious houses in France. By 1904, 13,000 schools had been suppressed. In 1905 the government, having broken off relations with the Holy See, confronted the church with the alternatives of wholesale confiscation or subordination to the civil authorities. Pius X decided against subordination and himself consecrated 14 bishops in St. Peter's. Persecution united the "disestablished" church more firmly to the Holy See. The secularist and anti-clerical policy of the French government continued to World War I. "There are now no parties," said the president, "there is only immortal France." The government conceded to war what it denied to Christianity.

During the same period Austria was the scene of similar hostilities. *Los von Rom und Drang nach Osten* together marked the drift of the Habsburg dominions from their ancient and central position in Catholic Europe. Catholics, suffering from the weakness of a large traditional majority, were divided. Josephism was still alive among the clergy and at court. The Germanic myth whose centre was neither Rome nor Vienna but Berlin was propagated among the German, liberal and anti-Catholic minority. The universities of Innsbruck, Vienna, Graz and Prague were agitated by the ideological war. A campaign of slander against the clergy

raised a union of priests and lawyers in their defense (*Rechtsschützverein*). A Catholic university at Salzburg was projected (1902). The *Piusverein* (1905) united the Catholic press, and at the Vienna congress (1905) it was declared that the "Catholic faith is the spiritual bond which unites the peoples of Austria." Pan-German deputies in the chamber demanded that the German provinces should join the empire of the Hohenzollerns as Lajos Kossuth and others in the 19th century had demanded separation for Hungary. With the outbreak of war in 1914 and the death of Francis Joseph in 1916 the Habsburg empire fell to pieces. The church and the Catholic faith remained.

Between World Wars I and II the logic of determinism and power politics ceased to be national and became universal. The patriotism of the materialists perished and was succeeded by a materialism without frontiers or citizenship, which denied all obligations but those imposed by force and exacted by cruelty. The last acts of Benedict XV had been devoted to relief. Pius XI (1922-39), still urging relief, especially for Russia, instituted the Feast of Christ the King (1925). In 1931 he took up the theme of *Rerum novarum* in the encyclical *Quadragesimo anno* and against the fascist government reaffirmed moral freedom. Fascism, he said, was a "regime based on an ideology which amounts to a really pagan worship, the state." Two years later the struggle in Spain revealed the extent of the Russian revolution—"hatred of the Lord and His church nourished by groups subversive to any religious and social order as we have seen in Mexico and Russia." In 1937 he addressed his letter *Mit brennender Sorge* to the German bishops, denouncing the Nazi regime, and in the encyclical *Divini Redemptoris* he denounced "the most persistent enemies of the church who from Moscow are directing the struggle against Christian civilization." In 1939 the next pope, Pius XII, broadcast his five peace points, demanding the right to life and independence for all nations great and small, progressive disarmament, provision for revising treaties, the protection of minorities and the spirit of good faith. He broadcast five points of a "new order based on moral principles" two years later and never ceased to confront the tide of racial degradation and massacre with pleas for justice and charity.

In the hemisphere dominated by the U.S.S.R. his voice could not be heard. The "iron curtain," a war frontier devised without consideration of human rights or needs by victorious powers, left eastern Europe and a great part of Asia at the mercy of a left necessitarianism, without faith in man or morals, to which "progress of science," in the words of *Pravda*, "all religions stand in direct contradiction." The 50,000,000 Catholics subject to this "progress" lived in a process of martyrdom. Their bishops were systematically deported, their schools controlled by Communists, their property confiscated and the unsubmissive "liquidated."

In 1940 the Congregation of the Holy Office decreed that it is unlawful for Catholics to enlist in or show favour to the Communist party, or to publish, write or read anything in support of the Communist doctrine and that any Catholic doing so must be denied the sacraments as an apostate from the Catholic faith.

The effect within the church of this consummate apostasy not only from God but from man was to realize the organic unity of the church as the body of Christ the God-Man with a unanimity and cleanness which it had not known since its first generation. In 1870 the pope had become the sovereign vicar of Christ the King, exercising a type of sovereignty that the world had never seen before, rooted in the devotion of 350,000,000 subjects. He defined the Mystical Body of Christ in an encyclical in 1943 and the dogma of the Bodily Assumption into Heaven of the Blessed Virgin Mary in 1950.

In contrast with the destruction and unrest of secularized Europe, in which innumerable conflicts tended toward world war, the church was defined, consolidated and extended. Leo XIII commended Thomas Aquinas to all the bishops as the "master and prince of scholastic doctors" (*Aeterni Patris*, 1879), founded the Academy of St. Thomas in Rome (1880) and authorized a new edition of his works based on the edition of the Dominican pope, St. Pius V (1590). By 1906 the edition was complete. Pius X began the codification of canon-law completed under Benedict XV

in 1917. The study of philosophy and theology was ordered "to be carried on in seminaries according to the arguments, doctrines and principles of St. Thomas which they are inviolately to hold." In 1902 Leo XIII appointed a commission for biblical studies under four cardinals. Pius X imposed the study of Scripture on all seminaries (1906) and ruled (1907) that the commission should examine all important controversies relating to the Bible. He revived (1907) the work of correcting the text of the Vulgate started under Pius IX by the Barnabite Fr. Vercolegne; and in 1909 he founded the Biblical Institute in Rome. In 1907 (*Pascendi dominici gregis*) and again in 1910 (*Edicta saepe*) he condemned "modernism," the "meeting place of all heresies." It is impossible to summarize the missionary activity of an apostolic church. Dominicans entered China in the 13th century; the Jesuits in the 16th were followed by Franciscans, Dominicans and Vincentians. The mission established by St. Francis Xavier in Japan (1549) had grown in 50 years to 300,000 members and then seemed by 1640 to be extinguished by a massacre. Yet in 1865 Catholic missionaries discovered a surviving church of 30,000 who without priests or sacraments had maintained acknowledgment of the pope and devotion to Our Lady. In 1862 Pius IX canonized the Japanese martyrs. African missions started on the coast by Jesuits and Dominicans (1596, 1614) were revived in the 19th century by the Holy Ghost Fathers (1842), the Society for African Missions (1850), the White Fathers (1868) and the Society of St. Joseph (1866).

In England the emancipation of 1829 followed by N. P. S. (later Cardinal) Wiseman's visit in 1835 began a rapid expansion. William George Ward and J. H. Newman, received in 1845, started a movement of Anglicans and intellectuals into the church. The Irish immigration, which began in 1847 and reached its highest figure in 1861, not only trebled the Catholic population but changed the character and work of the church in England: "I have given up working for the people of England," said Manning, "to work for the Irish occupation in England." The immigrants, poor and often destitute, brought their traditional Catholicism, neither English nor European, and in due course provided the bulk of the Catholic working population and a majority of parish priests. Religious orders revived. The Jesuits were at Stonyhurst in 1794, the Benedictines at Ampleforth in 1802 and at Downside in 1814. In 1840 through the work of the Downside monk Bernard Ullathorne the hierarchy was established in Australia. The Jesuit church at Farm street, London, was opened in 1849. In 1843 the Redemptorists, in 1842 the Passionists, in 1835 the Rosminians and in 1847 the Oratorians (Newman's foundation) were established. Irish Cistercians settled in 1837 at St. Bernard's in Leicestershire. In 1850 a revival of the Dominican province began at Woodchester. The Franciscans (Capuchins) returned in 1850 to work heroically among the poor, especially of South Wales, and Friars Minor started an English province in 1873. In 1850 Pius IX restored the English hierarchy. Women's orders multiplied their houses and above all their schools. The Institute of the Blessed Virgin founded by Mary Ward (1585-1645) already possessed a convent in York, and by mid-20th century the order in two branches numbered more than 5,000 sisters. Cornelia Connelly, a convert, founded the Order of the Holy Child. In 1854 Frances Lescher founded the first and greatest training college for Catholic teachers at Liverpool. Margaret Hallahan began the educational work of the Dominican Tertiaries. Carmelites with a tradition going back to St. Theresa were established at Wells (1864) and at Chichester (1892).

UNITED STATES

Whatever may be the final verdict of history in regard to the very ancient and fascinating Celtic tales of ocean wanderings in which St. Brendan and his companions figure so prominently, many historians of the Catholic Church in the new world have accepted some of these legends as an initial page in their chronicles. A well-documented study of the *Navigatio Brendani* and the land of promise with an exhaustive bibliography was published in the *Catholic Historical Review*, pp. 395-477 (Jan. 1921), by Joseph Dunn, head of the Celtic department of the Catholic University of America. The historical link between the alleged pre-Columbian discoveries of the new world and the mediaeval church in Greenland is found in the Norse sagas. The Norse church in mediaeval America attracted the attention of scholars as a result of the publication (1893) of the documents from the Vatican archives pertaining to the diocese of Gardar in Greenland. This first Catholic diocese in the new world was established about 1125 and had resident bishops until 1377. After this date until 1492, few of the incumbents of the see resided in Greenland. The letter of Pope Alexander VI (1493) appointing the last bishop says that "on account of the freezing of the sea no ship is supposed to have touched there during the past eighty years" (cf. *The Norse Church in Medieval America*, in the *Catholic Historical Review*; bibliography [July 1925]).

Of the three principal colonizing nations—Spain, France and England—the two former were Catholic and the third began its voyages of discovery under a Catholic king, Henry VII. The first attempt to set up church organization in the newly discovered continent was the appointment in 1493 of Bernard Boyl, or Bull, as vicar apostolic of the "Indies." Bishop-Elect Boyl accompanied Columbus on his second voyage. His labours were of short duration and of no permanent value. In 1504 Pope Julius II appointed three bishops to Hispaniola (Haiti), but the Spanish crown refused to confirm their election and the sees were suppressed. Seven years later the permanent dioceses of San Domingo and Concepcion (Haiti) and San Juan (Puerto Rico) were established. The see of Santiago de Cuba, erected in 1522, was the ecclesiastical centre of the Spanish missions on the mainland until 1545, when the three provinces or archbishops—Lima, Mexico City and San Domingo—were erected by Pope Paul III. In 1565 the parish of St. Augustine, the first within the confines of the present United States, was founded as part of the diocese of Santiago. Thus, three-quarters of a century after the discovery by Columbus, the regular canonical life of the church was well established. Out of the archdiocese of Mexico City grew later the suffragan Mexican sees of Guadalajara, Durango, Linares and Sonora, which ruled the southwestern portion of the United States until the middle of the 19th century. One of the heroic chapters in American history is that on the Franciscan, Dominican and Jesuit missions of the southwest and in California.

The French explorers and colonizers of the 16th and 17th centuries were, with few exceptions, Catholics and were ably supported by missionary groups; among them were the Récollets, Jesuits, Sulpicians, Capuchins and the secular clergy. New

France was erected into a vicariate apostolic in 1658, with Bishop François de Montmorency Laval at its head. The see of Quebec (1674) had spiritual jurisdiction over all the vast province of France in North America, including the wide-spreading valley of the Mississippi, together with Louisiana.

In the English colonies along the Atlantic coast, Catholicism was generally legally proscribed. The exceptions were: Maryland, from its foundation by the Catholic Calvert in 1634 until the Puritan uprising of 1650; Rhode Island, presumably from its settlement by Roger Williams in 1636 and historically from the charter of 1663; and Pennsylvania, founded by William Penn in 1682, where there is evidence of Catholics from its earliest settlement. Thus, according to Catholic historians, Maryland has the distinction of being the first English settlement where religious freedom was part of the common law (cf. Russell, *Maryland, Land of Sanctuary* [1907]). From 1634 to 1773 Jesuits of English and American origin ministered to the Catholics in Maryland, Pennsylvania and northern Virginia. After the suppression of the Society of Jesus (1773), the legal Corporation of the Roman Catholic Clergy continued to carry on missionary work, with Father John Lewis as superior. In 1784 Father John Carroll, who had won national reputation through his part in the commission to Canada (1776), was appointed prefect apostolic of the church in the United States. Six years later he became the first bishop of Baltimore, with jurisdiction over the entire church in the new republic. There were at this time (1790) 25 priests and about 30,000 Catholics in the United States. In 1808 Baltimore became a province or archdiocese with suffragan sees at Boston, New York, Philadelphia and Bardonia, Ky. Ten years later, Archbishop Ambrose Maréchal reported to the Holy See that there were 35 priests and about 100,000 Catholics in the United States.

There is hardly any parallel in the history of Catholicism to the rapid growth of the church in the United States during the 100 years following the death of Archbishop Maréchal (1828)—from about 300,000 to about 20,000,000. By mid-20th century this number had increased to approximately 27,000,000. The growth of the Catholic Church in the United States was the result of immigration, natural increase and conversions.

Racial Composition.—Racially, the church in the United States is made up of groups from every nation in the world, with the English-speaking peoples in the majority. Up to the middle of the 19th century, the Irish and the Germans furnished the greater quota of its adherents. Later the French-Canadians, Italians, Mexicans, Poles, Lithuanians, Slovaks, Hungarians and others added notably to the number. There is also an appreciable percentage of oriental Catholics—Greeks (Uniates), Syrians, Armenians, etc.

External Relations.—This almost unprecedented growth of a religious organization which had been subject to legal and political disabilities since the 16th century was bound to give rise to misunderstandings in a country so largely composed of Protestants. After the rise of the American republic several organized politico-religious movements were instituted for the purpose either of hindering the exercise of the franchise on the part of U.S. Catholic citizens or of keeping Catholic Americans out of offices of public trust. Chief among these were the American Protestant association (1829), the Native-American party (1837-44), the Know Nothings (1855-61), the American Protective association (1896) and later the Ku Klux Klan. Being under the protection of the constitution, and enjoying the advantages of the common law, Catholicism did not meet with any official governmental opposition. All such political or religious anti-Catholicism was temporary or local and did not represent the more general attitude of U.S. citizens. These movements never became national and were the result of conditions in which political, social and industrial problems were closely intermingled. The political theory of an inherent antagonism between Catholicism and Americanism gave rise to many interesting studies. Many writers on the alleged incompatibility between Catholicism and republican institutions failed to give due allowance to the racial and economic adjustments involved in these sectional antagonisms to the church.

Internal Development.—The internal development of the church in the United States was of a uniform nature. Its doctrinal history offers little of importance. The church discipline in vogue is similar to that of the other churches of Catholicism. Unity of doctrine, of moral law and of liturgical observance is preserved by an intimate union with the see of Rome. The universal canonical legislation of the church as reorganized in the New Code of Canon Law (1918), the legislation by papal rescript, the decisions in contentious cases by the apostolic delegation at Washington, D.C., and a certain number of customs and practices which grew up in the U.S. church formed the basis for its domestic relations. Every five years each U.S. bishop is expected to pay a visit to Rome (*ad limina Apostolorum*) and to make a report of the spiritual condition of his diocese. A system of diocesan synods provides for local unity among the bishops, clergy and laity. Each province is convened into provincial councils from time to time, and at greater intervals a national or plenary council is held. Three such councils were held (1852, 1866, 1884) at Baltimore. A graduate school of canon law was established at the Catholic University of America, Washington, D.C.

Education.—An outstanding factor in the internal development of the church in the United States was in the field of education. According to the *Official Catholic Directory* for 1952, there were 8,358 parochial or elementary schools in which 2,692,706 boys and girls received secular and religious instruction. The outlay involved in the parochial school system was estimated at \$205,000,000 annually. Catholics at the same time continued to contribute their proportionate share to the maintenance of the public schools.

There were also 1,623 diocesan high schools and 233 colleges and universities. This system of secondary and higher education was crowned by establishment of the Catholic University of America at Washington, D.C., in 1887 by Pope Leo XIII and the U.S. hierarchy and its endowment with the privileges of the old pontifical universities of Europe. The purpose of the founders of this central institution was to carry the graduates of the Catholic colleges into higher scholarship and thus prepare teachers for the entire Catholic educational system as well as leaders in the world of science and literature. The Catholic Sisters college, founded as an integral part of the Catholic University of America (1914), gave to the religious women teaching in the Catholic schools equal opportunities for higher training.

There were 17 Catholic universities in charge of the Society of Jesus at mid-20th century, three under the Vincentians, two under the Holy Cross Fathers and the Brothers of Mary and one under the Holy Ghost Fathers.

The education of the clergy was provided for by 424 seminaries, in which there were more than 30,900 students. A *Directory of Catholic Schools and Colleges* for the United States and a *Directory of Catholic Charities* were established. There were 351 institutions caring for 40,718 children and 20,543 in foster homes in 1952. For care of physically handicapped children there were 24 institutions and for the mentally handicapped 14. There were 152 protective institutions with a population of 15,029. Catholic homes for the aged totalled 271 and cared for more than 24,000 aged persons.

Administration.—The actual government of the church in the United States was represented in 1952 by the apostolic delegate at Washington, 3 cardinals (Chicago, Detroit and New York), 27 archbishops (Baltimore, Boston, Cincinnati, Denver, Dubuque (2), Indianapolis, Los Angeles, Louisville, Milwaukee, Newark, New Orleans, Omaha, Philadelphia, Portland, Ore., St. Louis, St. Paul, San Antonio, San Francisco, Santa Fe, Washington, D.C., Seattle, Brooklyn, Cleveland, Fargo, St. Augustine, Savannah-Atlanta), 158 bishops and 44,459 priests. There were 15,653 parishes, 4,790 missions and 4,953 chapels. Several hundred daily, weekly, biweekly and monthly publications were printed in English and foreign languages. There were also several literary and academic reviews, published monthly and quarterly, of a high order of merit.

National Development.—Students of the social and intellectual forces of Catholicism in the United States gave considerable

attention to the development of the church along national lines. Changes in the immigration policy of the country rendered this development possible, since it permitted the racial elements to be more easily assimilated to national ideals. Many agencies helped effect this general evolution, among them the Catholic Educational association, the National Conference of Catholic Charities, the Catholic Hospital association, the International Catholic Guild of Nurses, the Catholic Near East Welfare association, the Central Bureau of the Central-Verein, the American Catholic Philosophical association and the American Catholic Historical association. All these organizations were aided by the central bureaus of the National Catholic Welfare conference at Washington. National organization was also effected through such societies as the Holy Name society, the Knights of Columbus, the Daughters of Isabella and the Catholic Daughters of America, the National Federation of Catholic College Students and the International Federation of Catholic Alumnae. An annual meeting of the U.S. hierarchy is held in November at the Catholic University of America for the discussion of mooted points in church discipline and progress. The National Catholic Welfare conference is directed by an administrative committee of bishops, reporting annually at the aforesaid meeting. The National Catholic Rural Life conference also meets annually.

Mission Work.—Missionary work was undertaken by U.S. priests and sisters in foreign fields. The Catholic Foreign Mission Society of America (Maryknoll, N.Y.) and the Dominicans and the Foreign Mission Sisters of St. Dominic established stations in China. The Holy Cross Fathers set up missions in India, the Passionists in China, the Redemptorists in Latin America, the Jesuits in China, India, the Philippines, Iraq and Latin America. A bureau for Catholic Indian missions was established at Washington and a national board for mission work among nonwhite people with headquarters in New York city. In social and welfare work the Knights of Columbus, with a membership approaching 1,000,000 men, assumed a position of leadership.

BIBLIOGRAPHY.—The chief foreign source collections for the history of the church in the United States are in Rome (Vatican archives and archives of propaganda), Paris, London (Westminster archives), Seville (Archivo General de Indias), Mexico City (national archives) and Quebec (archiepiscopal archives). Transcripts of these documents were deposited in the Shea collection at Georgetown university, in the archives of the Dominican House of Studies (Washington) and in the Guilday transcripts at the Catholic University of America. Every episcopal see has its own archives, and considerable material exists at the headquarters of the religious orders and congregations, particularly in Rome. The Catholic Archives of America at Notre Dame university are particularly rich in unpublished material. Printed sources will be found in the quarterly *Records and Reviews* of the Catholic historical societies in the United States and in *Official Catholic Year Books*. The *Catholic Historical Review* contains bibliographical references for all phases of U.S. Catholic history. Ecclesiastical legislation will be found in the *Acta et Decreta* of the Third Plenary Council of Baltimore.

The literature of American Catholic history of general and special nature is large in extent. J. D. G. Shea's four volumes on the *History of the Catholic Church in the United States* (1886-92) is still the standard work. The *Catholic Encyclopedia* contains articles on practically every noteworthy aspect of American Catholic history prior to 1918 and is especially valuable for biographical sketches. R. F. Clarke, *The Lives of the Deceased Bishops*, 2 vol. (1872), is generally trustworthy, though inadequate. Statistics are given annually in the *Official Catholic Directory*. The extended bibliographies of American church history, found in Peter Guilday's *Life of Archbishop Carroll* (1922) and his *Life and Times of John England, First Bishop of Charleston (1786-1842)* (1927), as well as in V. F. O'Daniel's *Right Rev. Edward Dominic Fenwick* (1920), give a set of provincial, diocesan and corporate histories. See also T. O'Gorman, *A History of the Roman Catholic Church in the United States* (1895); Theodore Maynard, *Story of American Catholicism* (1941); Peter Guilday, *History of the Councils of Baltimore (1791-1884)* (1932); *American Catholic Historical Researches; Jesuit Relations*, 73 vol. (1896-1901), edited by R. G. Thwaites, and the condensation in two volumes by Edna Kenton (1925). See also the article in the *Catholic Historical Review*, 1:470-477 (1917) on "Catholic Historical Scholarship in the United States"; J. P. Cadden, *Historiography of the American Catholic Church: 1785-1943* (1944); J. T. Ellis (comp.), *Select Bibliography of the History of the Catholic Church in the United States* (1947); T. Maynard, *Story of American Catholicism* (1948); D. Shearer, *Pontificia Americana: A Documentary History of the Catholic Church in the United States (1784-1884)* (1933); L. Palladino, *Indian and White in*

the Northwest (1894); P. J. de Smet, *Western Missions and Missionaries* (1863); Chittenden and Richardson, *Life, Letters and Travels of Pierre de Smet*, 4 vol. (1905).

ROMANCE, originally a composition written in "Romance" language; i.e., in one of the phases on which the Latin tongue entered after or during the dark ages. For some centuries by far the larger number of these compositions were narrative fictions in prose or verse; and since the special "Romance" language of France—the earliest so-called—was the original vehicle of nearly all such fictions, the use of the term for them became more and more accepted in a limited sense. Yet for a long time there was no definite connotation of *fiction* attached to it, but only of narrative story; and the French version of William of Tyre's *History of the Crusades*, a very serious chronicle written towards the close of the 12th century, bears the name of *Roman d'Éracle* simply because the name of the emperor Heraclius occurs in the first line. But if the explanation of the name "Romance" is quite simple, certain and authentic, the same is by no means the case with its definition, or even with the origin of the thing to which that name came mostly to be applied. For some centuries an abstraction has been formed from the concrete examples. "Romance," "romanticism," "the romantic character," "the romantic spirit," have been used to express sometimes a quality regarded in itself, but much more frequently a difference from the supposed "classical" character and spirit. The following article will deal chiefly with the matter of Romance, excluding or merely referring to accounts of such individual romances as are noticed elsewhere. But it will not be possible to conclude without some reference to the vaguer and more contentious signification.

Romance in antiquity.—Speculations on the origin of the peculiar kind of story which we recognize rather than define under the name of romance have been numerous and sometimes confident; but a wary and well-informed criticism will be slow to accept most of them. It is certain that many of its characteristics are present in the *Odyssey*; and it is a most remarkable fact that these characteristics are singled out for reprehension—or at least for comparative disapproval—by the author of the treatise *On the Sublime*. The absence of central plot, and the prolongation rather than evolution of the story; the intermixture of the supernatural; the presence and indeed prominence of love-affairs; the juxtaposition of tragic and almost farcical incident; the variety of adventure arranged rather in the fashion of a panorama than otherwise: all these things are in the *Odyssey*, and they are all, in varying degrees and measures, characteristic of romance. Nor are they absent from the few specimens of ancient prose fiction which we possess. If the *Satyricon* of Petronius was ever more than a mass of fragments, it was certainly a romance, though one much mixed with satire, criticism and other things; and the various Greek survivals from Longus to Eustathius all ways and rightly receive the name. But two things were still wanting which were to be all-powerful in the romances proper—chivalry and religion. They could not yet be included, for chivalry did not exist and such religion as did exist lent itself but ill to the purpose except by providing myths for ornament and patterns pattern.

The "Saint's Life."—A possible origin of the new romance into which these elements entered (though it was some time before that of chivalry definitely emerged) has been seen by one of the least hazardous of the speculations above referred to in the hagiology or "Saint's Life," which arose at an early though uncertain period, developed itself pretty rapidly, and spreading over all Christendom (which by degrees meant all Europe and parts of Asia) provided centuries with their chief supply of what may be called interesting literature. If the author of *On the Sublime* was actually Longinus, the minister of Zenobia, there is no doubt that examples both sacred and profane of the kind of "fiction" ("imitation" or "representation") which he deprecated were mustering and multiplying close to, perhaps in, his own time. The Alexander legend of the pseudo-Callisthenes is supposed to have seen the light in Egypt as early as A.D. 200, and the first Greek version of that "Vision of Saint Paul," which is the ancestor of all the large family of legends of the life after death, is pretty

certainly as old as the 4th century and may be as old as the 3rd. The development of the Alexandroid was to some extent checked or confined to narrow channels as long as something like traditional and continuous study of the classics was kept up. But hagiology was entirely free from criticism; its subjects were immensely numerous; and in the very nature of the case it allowed the tendencies and the folklore of three continents and of most of their countries to mingle with it. Especially the comparative sobriety of classical literature became affected with the Eastern appetite for marvel and unhesitating acceptance of it; and the extraordinary beauty of many of the central stories invited and necessitated embroidery, continuation, episode. Later, no doubt, the adult romance directly reacted on the original saint's life, as in the legends of St. Mary Magdalene most of all, of St. Eustace, and of many others. But there can be very little doubt that if the romance itself did not spring from the saint's life it was fostered thereby.

The Gathering of Matter.—Proceeding a little further in the cautious quest—not for the definite origins which are usually delusive, but for the tendencies which avail themselves of opportunities and the opportunities which lend themselves to tendencies—we may notice two things very important to the subject. The one is that as Graeco-Roman civilization began to spread north and east it met, to appearance which approaches certainty, matter which lent itself gladly to "romantic" treatment. That such matter was abundant in the literature and folk-lore of the East we know: that it was even more abundant in the literatures and folk-lore of the North, if we cannot strictly be said to *know*, we may be reasonably sure. On the other hand, as the various barbarian nations (using the word in the wide Greek sense), at least those of the North, became educated to literature, to "grammar," by classical examples, they found not a few passages in these examples which were either almost romances already or which lent themselves, with readiness that was almost insistence, to romantic treatment. Apollonius Rhodius had made almost a complete romance of the story of Jason and Medea. Virgil had imitated him by making almost a complete romance of the story of Aeneas and Dido; and Ovid, who for that very reason was to become the most popular author of the middle ages early and late, had gone some way towards romancing a great body of mythology. We do not know exactly who first applied to the legendary tale of Troy the methods which the pseudo-Callisthenes and "Julius Valerius" applied to the historical wars of Alexander, but there is every reason to believe that it was done fairly early. In short, during the late classical or semi-classical times and the whole of the dark ages, things were making for romance in almost every direction.

It would and did follow from this that the thing evolved itself in so many different places and in so many different forms that only a person of extraordinary temerity would put his finger on any given work and say, "This is the first romance," even putting aside the extreme chronological uncertainty of most of the documents that could be selected for such a position. Except by the most meteoric flights of "higher" criticism we cannot attain to any opinion as to the age and first developed form of such a story as that of Weland and Beadhiild (referred to in the *Complaint of Deor*), which has strong romantic possibilities and must be almost of the oldest. The much more complicated Volsung and Nibelung story, though we may explore to some extent the existence backwards of its Norse and German forms, baffles us beyond certain points in each case; yet this, with the exception of the religious element, is romance almost achieved. And the origin of the great type of the romance that *is* achieved—that has all elements present and brings them to absolute perfection—the Arthurian legend, despite the immense labours that have been spent upon it and the valuable additions to particular knowledge which have resulted from some of them, is, still more than its own Grail, a quest unachieved, probably a thing unachievable. The longest and the widest inquiries, provided only that they be conducted in any spirit save that which determines to attain certainty and therefore concludes that certainty has been attained, will probably acquiesce most resignedly in the dictum that ro-

mance "grew"—that its birthplace is as unknown as the grave of its greatest representative figure.

But when it has "grown" to a certain stage we can find it, and in a way localize it, and more definitely still analyse and comprehend its characteristics from their concrete expressions.

CLASSES OF SOURCE

Approaching these concrete expressions, then, without at first putting forward excessively hard and fast requirements in regard to the validation of the claims, we find existing in Europe about the 11th century (the time is designedly left loose) divers classes of what we should now call imaginative or fictitious literature, nearly all (the exceptions are Scandinavian and Old English) in verse. These are: (i.) The saints' lives; (ii.) the Norse sagas, roughly so-called; (iii.) the French *chansons de geste*; (iv.) the Old English and Old German stories of various kinds; (v.) perhaps the beginning of the Arthurian cycle; (vi.) various stories more or less based on classical legend or history from the tales of Alexander and of Troy down to things like *Apollonius of Tyre*, which have no classical authority of either kind, but strongly resemble the Greek romances, and which were, as in the case named, pretty certainly derived from members of the class; (vii.) certain fragments of Eastern story making their way first, it may be thought, through Spain by pilgrimages, latterly by the crusades.

Now, without attempting to fence off too rigidly the classical from the romantic, it may be laid down that these various classes possess that romantic character, to which we are, by a process of netting and tracking, slowly making our way, in rather different degrees, and a short examination of the difference will forward us not a little in the hunt.

With i. (the saints' lives) we have least to do: because by the time that romance in the full sense comes largely and clearly into view, it has for the most part separated itself off—the legend of St. Eustace has become the romance of Sir Isumbras, and so forth. But the influence which it may, as has been said, have originally given must have been continually re-exerted: the romantic-dynamic suggestion of such stories as those of St. Mary of Egypt, of St. Margaret and the Dragon, of St. Dorothea, and of scores of others, is quite unmistakable. Still, in actual result, it works rather more on drama than on narrative romance, and produces the miracle plays.

In ii. (the sagas), while a large part of their matter and even not a little of their form are strongly romantic, differences of handling and still more of temper have made some demur to their inclusion under romance, while their final ousting in their own literatures by versions of the all-conquering French romance itself is an argument on the same side. But the Volsung story, for instance, is full of what may be called "undistilled" romance—the wine is there, but it has to be passed through the still—and even in the most domestic sagas proper this characteristic is largely present.

It is somewhat less so in iii. (the *chansons de geste*), at least in the apparently older ones, though here again the comparative absence of romantic characteristics has been rather exaggerated, in consequence of the habit of paying disproportionate and even exclusive attention to the *Chanson de Roland*. There is more, that is, of romance in *Aiscans* and others of the older class, while *Amis and Amiles*, which must be of this class in time, is almost a complete romance, blending war, love and religion—*salus, venus, virtus*—in full degree.

The other four classes, the miscellaneous stories from classical, Eastern and European sources, having less corporate or national character, lend themselves with greater ease to the conditions of romantic development; but even so in different degrees. The classical stories have to drop most of their original character and allow something very different to be superinduced before they become thoroughly romantic. The greatest success of all in this way is the story of *Troilus and Cressida*. For before its development through the successive hands of Benoît de Sainte-More, Boccaccio (for we may drop Guido of the Columns as a mere middleman between Benoît and Boccaccio) and Chaucer, it has next to no classical authority of any kind except the mere names. In the

various Alexandreids the element of the marvellous—the Eastern element, that is to say—similarly overpowers the classical. As for the Eastern stories themselves, they are particularly difficult of certain unravelment. The large moral division—such as *Barlaam and Josaphat*, the *Seven Wise Masters* in its various forms, etc., comes short of the strictly romantic. We do not know how much of East and how much of West there is in such things as *Florie et Blanchefleur* or even in *Huon of Bordeaux* itself. Contrariwise we ought to know, more certainly than apparently is known yet, what is the date and history of such a thing as that story of *Zumarrud and Ali Shah*, which may be found partly in Lane and fully in the complete translations of the *Arabian Nights*, though not in the commoner editions, and which is evidently either copied from, or capable of serving as model to, a Western *roman d'aventures* itself.

We come, however, much closer to the actual norm itself—closer, in fact, than in any other place save one—in the various stories, English, French, and to a less extent German,¹ which gradually received in a loose kind of way the technical French term just used, a term not to be translated without danger. Nearly all these stories were drawn, by the astonishing centripetal tendency which made France the home of all romance between the 11th and the 13th centuries, into French forms; and in most cases no older ones survive. But it is hardly possible to doubt that in such a case, for instance, as *Havelok*, an original story of English or Scandinavian origin got itself into existence before, and perhaps long before, the French version was retransferred to English, and so in other cases. If, once more, we take our existing English *Havelok* and its sister *King Horn*, we see that the latter is a more romanced form than the former. *Havelok* is more like a *chanson de geste*—the love interest in it is very slight; while in *King Horn* it is much stronger, and the increased strength is shown by the heroine being in some forms promoted into the title. If these two be studied side by side the process of transforming the mere story into the full romance is to no small extent seen in actual operation. But neither exhibits in any considerable degree the element of the marvellous, or the religious element, and the love interest itself is, even in *Horn*, simple and not very dramatically or passionately worked out. In the later *roman d'aventures*, of which the 13th century was so prolific (such as, to give one example out of many, *Amadas and Idoine*), these elements appear fully, and so they do in the great Auchinleck collection in English, which, though dating well within the 14th century, evidently represents the meditation and adaptation of French examples for many years earlier.

The last of our divisions, however, exhibits the whole body of romantic elements as nothing else does. It is not our business in this place to deal with the Arthurian legend generally as regards origin, contents, etc., nor, in the present division of this actual article, to look at it except for a special purpose and in connection with and contrastive to the other groups just surveyed. Here, however, we at last find all the elements of romance, thoroughly mixed and thoroughly at home, with the result not merely that the actual story becomes immensely popular and widely spread; not only that it receives the greatest actual development of any romantic theme; but that, in a curious fashion, it attracts to itself great numbers of practically independent stories—in not a few cases probably quite independent at first—which seem afraid to present themselves without some tacking on (it may be of the loosest and most accidental description) to the great *polycentric* cycle, the stages of which gather round Merlin, the Round Table, the Grail and the Guinevere-Lancelot-Mordred catastrophe. All the elements, let it be repeated, are here present: war, love and religion; the characteristic extension of subject in desultory adventure-chronicles; the typical rather than individual character (though the strong individuality of some of the unknown or half-known contributors sometimes surmounts this); the admixture of the marvellous, not merely though mainly as part of the religious element; the presence of the chivalrous ideal.

¹Italian romance seems to have modelled itself early on French, and it is doubtful, rich as is the late crop of Spanish romances, whether we have any that deserve the name strictly and are really early.

The strong dramatic interest of the central story is rather super-added to than definitely evolved from these elements; but they are still present, just as, though more powerfully than, in the weakest of miscellaneous *romans d'aventures*.

TYPES OF STORY, INCIDENT AND PERSONAGES

A further step in the logical and historical exploration of romance may be taken by regarding the character-and-story classes round which it groups itself, and which from the intense community of mediaeval literature—the habit of mediaeval writers not so much to plagiarize from one another as to take up each after each the materials and the instruments which were not the property of any—is here especially observable. Prominent above everything is the world-old motive of the quest; which, world-old as it is, here acquires a predominance that it has never held before or since. The object takes pretty various, though not quite infinitely various, forms, from the rights of the disinherited heir and the hand or the favour of the heroine, to individual things which may themselves vary from the Holy Grail to so many hairs of a sultan's beard. It may be a friendly knight who is lost in adventure, or a felon knight who has to be punished for his trespasses; a spell of some kind to be laid; a monster to be exterminated; an injured virgin or lady, or an infirm potentate, to be succoured or avenged; an evil custom to be put an end to; or simply some definite adventure or exploit to be achieved. But quest of some sort there must certainly be if (as in *Sir Lancelot*, for instance) it is but the recovery of a love forfeited by misbehaviour or mishap. It is almost a *sine qua non*—the present writer, thinking over scores, nay hundreds, of romances, cannot at the moment remember one where it is wanting in some form or another.

It will be observed that this at once provides the amplest opportunity for the desultory concatenation or congregation of incident and episode which is of the very essence of romance. Often, nay generally, the conditions, localities and other circumstances of the quest are half known, or all but unknown, to the knight, and he is sometimes intentionally led astray, always liable to be incidentally called off by interim adventures. In many (perhaps most) cases the love interest is directly connected with the quest, though it may be in the way of hindrance as well as of furtherance or reward. The war interest always is so connected; and the religious interest commonly—almost universally in fact—is an inseparable accident. But everything leads up to, involves, eventuates in the fighting. The quest, if not always a directly warlike one, always involves war; and the endless battles have at all times, since they ceased to be the great attraction, continued to be the great obloquy of romance. It is possible no doubt that reports of tournaments and single combats with lance and sword, mace and battle-axe, may be as tedious to some people as reports of football matches certainly are to others. It is certain that the former were as satisfactory in former times to their own admirers as the latter are now. In fact the variety of incident is almost as remarkable as the sameness. And the same may be said, with even greater confidence, of the adventures between the fights in castle and church and monastery, in homestead or hermitage. The actual stories are not much more alike than those who have read large numbers of modern novels critically know to be the case with them. But the absence, save in rare cases, of the element of character, and the very small presence of that of conversation, show up the sameness that exists in the earlier case.

The same deficiency in individual character-drawing, and in the conversation which is one of its principal instruments, brings out in somewhat unfair relief some other cases of apparent sameness—the “common forms” of story and of character itself. The disinherited heir, the unfaithful or wronged wife, the wicked step-mother, the jealous or wrongly suspected lover, are just as universal in modern fiction as they are in mediaeval—for the simple reason that they are common if not universal in nature. But the skeleton is more obvious because it is less clothed with flesh and garments over the flesh; the texture of the canvas shows more because it is less worked upon. Some of these common forms, however, are more peculiar to mediaeval times; and some, though not many, allow excursions into abnormalities which, until

recently, were tabooed to the modern novelist. Among the former the wickedness of the steward is remarkable, and of course not difficult to account for. The steward or seneschal of romance, with some honourable exceptions, is as wicked as the baronet of a novel, but here the explanation is not metaphysical. He was constantly left in charge in the absence of his lord and so was exposed to temptation. The extreme and almost Ephesian consolableness of the romance widow can be equally rationalized—and in fact is so in the stories themselves—by the danger of the fief being resumed or usurped in the absence of a male tenant who can maintain authority and discharge duties. While such themes as the usually ignorant incest of son with mother or the more deliberate passion of father for daughter come mostly from very popular early examples—the legend of St. Gregory of the Rock or the story of Apollonius of Tyre.

Characters of Romance Proper.—The last point brings us naturally to another of considerable importance—the singular *purity* of the romances as a whole, if not entirely in atmosphere and situation, yet in language and in external treatment. It suited the purposes of the Protestant controversialists of the Renaissance, such as our own Ascham, to throw discredit upon work so intimately connected with Catholic ceremony and belief as the *Morte d'Arthur*; and it is certain that the knights of romance did not even take the benefit of that liberal doctrine of the *Cursor Mundi* which regards even illicit love as not mortal unless it be "with spouse or sib." But if in the romances such love is portrayed freely, and with a certain sympathy, it is never spoken of lightly and is always punished; nor are the pictures of it ever coarsely drawn. In a very wide reading of romance the present writer does not remember more than two or three passages of romance proper (that is to say before the latter part of the 15th century) which could be called obscene by any fair judge. And the term would have to be somewhat strained in reference even to these.

The contrast with the companion divisions of *fabliaux* and farces is quite extraordinary; and nearly as sharp as the difference between Greek tragedy on the one hand and Greek comedy or satiric play on the other. It is brought out for the merely English reader in Chaucer of course, but in him it might have been studied. In the immense *corpus* of known or unknown French and English writers (the Germans are not quite so particular) it comes out with no possibility of deliberation and with unmistakable force.

The history of the forms in which romance presents itself follows a sufficiently normal and probable course. The oldest are always—save in the single case of part of the Arthurian division, in which we probably possess none of the *actually* oldest, and in some of the division of Antiquity which had a long line of predecessors in the learned languages—the shortest. They become lengthened in a way continued and exemplified to the present moment by the tendency of writers to add sequels and episodes to their own stories, and made still more natural by the fact that these poems were in all or almost all cases *recited*. "Go on" is the most natural and not the least common as well as the most complimentary form of "Bravo!" and the reciter never seems to have said "no" to the compliment. In not a few cases—*Huon of Bordeaux*, *Ogier the Dane*, *Guy of Warwick*, are conspicuous examples—we possess the same story in various stages; and can see how poems, perhaps originally like *King Horn* of not more than a couple of thousand lines or even shorter in the 13th century, grew to thirty, forty, fifty thousand in the 15th. The transference of the story itself from verse to prose is also—save in some particular and still controverted instances—regularly traceable and part of a larger and natural literary movement. While, also naturally enough, the pieces become in time fuller of conversation (though not as yet out of conversation that advances the story or heightens its interest), of descriptive detail, etc. And in some groups (notably that of the remarkable *Amadis* division) a very great enlargement of the proportion and degradation of the character of the marvellous element appears—the wonders being no longer mystical, and indeed being magical only in the lower sense.

CHARACTERISTIC EXAMPLES

And so we come to the particular characteristics of the kind or kinds demonstrated in individual examples. Of these the English reader possesses a matchless although a late instance in the *Morte d'Arthur* of Malory, a book which is at once a *corpus* and a pattern of romance in gross and in detail. The fact that it is not, as has been too often hastily or ignorantly asserted, a mere compilation, but the last of a singular series of rehandlings and redactions—conducted with extraordinary thorough for the most part indistinctly traceable instinct of genius—makes it to some extent transcend any single example of older date and more isolated composition. But it displays all the best as well as some of the less good characteristics of most if not all. Of the commonest kind—the almost pure *roman d'aventures* itself—the Gareth-Beaumains episode (for which we have no direct original, French or English, though *Lybius Disconus* and *Ipomedon* come near to it in different ways) will give a fair example; while its presentation of the later chapters of the Grail story, and the intertwined plot and continuing catastrophe of the love of Lancelot and Guinevere, altogether transcend the usual scope of romance pure and simple, and introduce almost the highest possibilities of the romantic novel. The way in which Malory or his immediate authorities have extruded the tedious wars round the "Rock of the Saxons," have dropped the awkward episode of the false Guinevere, and have restrained the uninteresting exuberance of the continental wars and the preliminary struggles with the minor kings, keeps the reader from contact with the duller sides of romance only. Of the real variety which rewards a persistent reader of the class at large it would be impossible to present even a miniature hand-index here; but something may be done by sample, which will not be mere sample, but an integral part of the exposition. No arbitrary separation need be made between French and English; because of the intimate connection between the two. As specially and symptomatically noteworthy the famous pair—perhaps the most famous of all—*Guy of Warwick* and *Bevis of Hampton*, should not be taken. For, with the exception of the separation of Guy and Felise in the first, and some things in the character of Josiane in the second, both are somewhat spiritless concoctions of stock matter. Far more striking than anything in either, though not consummately supported by their context, are the bold opening of *Blancandin et l'orgueilleuse d'amour*, where the hero begins by kissing a specially proud and prudish lady; and the fine scenes of fight with a supernatural foe at a grave to be found in *Amadas et Idoine*. Reputation and value coincide more nearly in the charming fairy story of *Parthenopée de Blois* and the Christian-Saracen love romance of *Flore* (Florie and other forms) et *Blanchefleur*. Few romances in either language, or in German, exhibit the pure adventure story better than Chrestien de Troyes's *Chevalier au Lyon*, especially in its English form of *Yvain and Gawain*; while the above-mentioned *Lybius Disconus* (*Le Beau Déconus*) makes a good pair with this. For originality of form and phrase as well as of spirit, if not exactly of incident, *Gawain* and the *Green Knight* stands alone; but another Gawain story (in French this time), *Le Chevalier aux deux épées*, though of much less force and fire, exceeds it in length without sameness of adventure. Only the poorest romances—those ridiculed by Chaucer in *Sir Thopas*—which form a small minority, lack striking individual touches, such as the picture of the tree covered with torches and carrying on its summit a heavenly child, which illuminates the huge expanse of *Dumart le Gallois*. The various forms of the *Seven Wise Masters* in different European languages show the attitude of the Western to the Eastern fiction interestingly. The beautiful romance of *Emaré* is about the best of several treatments of one of the exceptional subjects classed above—the unnatural love of father for daughter, while if we turn to German stories we find not merely in the German variants of Arthurian themes, but in others a double portion of the mystical element. French themes are constantly worked up afresh—as indeed they are all over Europe—but the Germans have the advantage of drawing upon not merely Scandinavian traditions like those which they wrought into the *Nibelungen Lied* and

Guadrin, but others of their own. And both in these and in their dealings with French they sometimes show an amount of story-telling power which is rare in French and English. No handling of the Tristan and Isolde story can compare with Gottfried's, while the famous *Der arme Heinrich* of Hartmann von Aue (the original of Longfellow's *Golden Legend*) is one of the greatest triumphs and most charming examples of romance, displaying in almost the highest degree possible for a story of little complexity all the best characteristics of the thing.

What, then, are these characteristics? The account has now been brought to a point where a reasoned résumé of it will give as definite an answer as can be given.

Even yet we may with advantage interpose a consideration of the answer that was given to this question universally (with a few dissidents) from the Renaissance to nearly the end of the 18th century and not infrequently since; while it is not impossible that, in the well-attested revolutions of critical thought and taste, it may be given again. This is that romance on the whole, and with some flashes of better things at times, is a jumble of incoherent and mostly ill-told stories, combining sameness with extravagance, outraging probability and the laws of imitative form, childish as a rule in its appeal to adventure and to the supernatural, immoral in its ethics, barbarous in its aesthetics, destitute of any philosophy, representing at its very best (though the ages of its lowest appreciation were hardly able even to consider this) a necessary stage in the education of half-civilized peoples, and embodying some interesting legends, much curious folklore and a certain amount of distorted historical evidence. On the other hand, for the last hundred years and more, there have been some who have seen in romance almost the highest and certainly the most charming form of fictitious creation, the link between poetry and religion, the literary embodiment of men's dreams and desires, the appointed nepenthe of more sophisticated ages as it was the appointed pastime of the less sophisticated. Between these opposites there is of course room for many middle positions, but few of them will be occupied safely and inexpugnably by those who do not take heed of the following conclusions.

Romance, beyond all question, emmeshes and retains for us a vast amount of story material to which we find little corresponding in ancient literature. It lays the foundation of modern prose fiction in such a fashion that the mere working out and building up of certain features leads to, and in fact involves the whole structure of the modern novel (*q.v.*). It antiquates (by a sort of gradual "taking for granted") the classical assumption that love is an inferior motive, and that women, though they "may be good sometimes" are scarcely fit for the position of principal personages. It helps to institute and ensure a new unity—the unity of interest. It admits of the most extensive variety. It gives a scope to the imagination which exceeds that of any known older literary form. At its best it embodies the new or Christian morality, if not in a Pharisaic yet in a Christian fashion, and it establishes a concordat between religion and art in more ways than this. Incapable of exacter definition, inclining (a danger doubtless as well as an advantage) toward the vague, it is nevertheless comprehensible for all its vagueness, and, informal as it is, possesses its own form of beauty—and that a precious one. These characteristics were, if perceived at all by its enemies in the period above referred to, taken at their worst; they were perceived by its champions at the turn of the tide and perhaps exaggerated. From both attitudes emerged that distinction between the "classic" and the "romantic" which was referred to at the beginning of this article as requiring notice before we conclude. The crudest, but it must be remembered the most intentionally crude (for Goethe knew the limitations of his saying), is that "Classicism is health; Romanticism is disease." In a less question-begging proposition of single terms, classicism might be said to be method and romanticism energy. But in fact sharp distinctions of the kind do much more harm than good. It is true that the one tends to order, lucidity, proportion; the other to freedom, to fancy, to caprice. But the attempt to reimpose these qualities as absolutely distinguishing marks and labels on particular works is almost certain to lead to mistake and disaster,

and there is more than mere irony in the person who defines romance as "Something which was written between an unknown period of the Dark Ages and the Renaissance, and which has been imitated since the later part of the 18th century." What that something really is, is not to be known well except by reading more or less considerable sections of it—by exploring it like one of its own forbidden countries. But something of a sketch map of that country has been attempted here.

See also articles on the different national literatures, especially French and Icelandic; and the following—

Classical or Pseudo-Classical Subjects.—APOLLONIUS OF TYRE; LONGUS; HELIODORUS; APULEIUS, LUCIUS; TROY AND THE TROJANS; CÆSAR, GAULS JULIUS; ALEXANDER III (THE GREAT); HERCULES; JASON; OEDIPUS; VIRGIL.

Arthurian Romance.—ARTHURIAN LEGEND; CHRETIEN DE TROYES; GOTTFRIED VON STRASSBURG; MALORY, SIR THOMAS; WOLFRAM VON ESCHENBACH; etc.

French Romance.—CHARLES THE GREAT; GUILLAUME D'ORANGE; DOON DE NARBONNE; OGER THE DANE; ROLAND, LEGEND OF; RENAUD DE MONTAIGNE (*Quatre fils Aymon*); HUON OF BORDEAUX; GRIART DE ROUSSEILLON, MACAIRE; PARTENOPEUS DE BLOIS; ROBERT THE DEVI; FLORE AND BLANCHEFEUILLE; RAUL DE CAMBRAI; GUILLAUME DE PALERNE; BENOÎT DE SAINT-MORE, etc.

Anglo-Norman, Anglo-Danish, English Romance.—BEVIS OF HAMPTON; DE HAVOK; HAVOK THE DANE; GUY OF WARWICK; ROBIN HOOD; MAID MARION.

German.—NIBELUNGENLIED; ORTNY; DIETRICH OF BERNE; WOLFDIETRICH; HELDENBUCH; WALTHERIUS; GUDRUN; HILDEBRAND, LAY OF; RUODLIF.

Northern.—SIGURD; WAYLAND THE SMITH; HAMLET; EDDA.

Spanish.—AMOVS DE GAUL.

Various.—REYNARD THE FOX; ROMAN DE LA ROSE; GRISEIDA and kindred stories; GENIEVIEVE OF BRABANT; GESTA ROMANORUM; BARLAAM AND JOSEPHAT; SEVEN WISE MASTERS; MAELDUN, VOYAGE OF.

Bibliography.—The first modern composition of importance on romance (putting aside the dealings of Italian critics in the 16th century with the question of romantic vs. classical unity) is the very remarkable dialogue *De la Lecture des vieux romans* written by Chapplain in mid-17th century (ed. Féllet, 1870), which is a surprising and thoroughgoing defense of its subjects. But for long afterward there was little save unintelligent and mostly quite ignorant depreciation. The sequence of really important serious works almost begins with Hurd's *Lectures on Chivalry and Romance* (1762). In succession to this may be consulted on the general subject (which alone can be here regarded) the dissertations of Percy, Warton and Ritson; Sir Walter Scott, "Essay on Romance" in the supplement to the *Encyclopædia Britannica* (1816-24); Dunlop, *History of Fiction* (1816, usefully supplemented and completed by its 4th edition, 1888, with very large additions by H. Wilson); C. L. B. Wolff, *Allgemeine Geschichte der Romane* (Jena, 1841-50); H. L. D. Ward, *Catalogue of Romances in the British Museum* (vol. 1, 1883, vol. 2, 1893) (the most valuable single contribution to the knowledge of the subject); G. Saintsbury, *The Flourishing of Romance and the Rise of Allegory* (1897), and its companion volumes in *Periods of European Literature* [W. P. Ker, *The Dark Ages* (1904); F. J. Snell, *The Fourteenth Century* (1898)]; G. Gregory Smith, *The Transition Period* (1900); D. Harney, *The Later Renaissance* (1898); W. P. Ker, *Epic and Romance* (1897). (G. S.)

ROMANCE LANGUAGES. The name given to the seven groups of languages, viz., Portuguese, Spanish, Provençal (including Catalan), French, Italian, the Rhaeto-Romanic idioms and Rumanian.

They are called "romance" (from post-classical Latin *romanicus*, derived from Latin *romanus*) because their basis is the Latin which was spoken in the Imperium Romanum. They are sometimes called "daughter languages" (*linguae filiae*) of Latin, though in no sense daughters, but Latin itself in the transformed state it has reached in the various countries in which it was spoken. The word Neo-Latin has been used for "Romance" by some scholars.

The comparative method systematically used by F. Diez (1794-1876) in his *Grammatik der romanischen Sprachen*, of which the first volume appeared in 1836, demonstrated conclusively that each of the above-mentioned languages was directly evolved from Vulgar or Popular Latin.

Within a few years of the appearance of Diez's studies new tendencies began to be felt, tendencies which Diez had himself approved but for lack of opportunity had not embodied. First, chiefly under the impulse of Paul Meyer (1840-1917) the documents preserved in the archives were taken into account; next came the study of the *patois* instigated by Gaston Paris (1839-1903) keenly pursued by investigators such as abbé Rouss-

selot (1846-1924) and Gilliéron (1854-1926), and yielding fresh materials for phonetic and lexicographical research; finally, the study of semantics began simultaneously in different countries.

W. Meyer-Luebbe, availing himself of the philological material now accessible in recorded dialect and patois, completely revised Dier's grammar and compiled a new *Grammatik der romanischen Sprachen* (4 vols. 1890-1902) on a much broader basis. This achievement marks the close of this period of romance philology.

The opening of the latest period is distinguished by the use of "linguistic geography" initiated by the appearance of the *Atlas historique de la France* by Gilliéron and Edmont, containing 2,319 maps, 1,920 for France proper (1902-1910) and 399 for Corsica (1914). Similar surveys have been attempted in other countries, but few have attained successful completion. Alone worthy of mention as regards romance languages are Weigand, *Linguistischer Atlas des dacorumänischen Sprachgebietes* (Leipzig, 1909), containing 67 maps only and none of the Bánat; Ch. Guérin de Guer, *Atlas dialectologique de la Normandie* (1903), comprising 123 maps but unfinished; Griera, *Atlas lingüístic de Catalunya*, which is to form 10 volumes (2,000 maps) vols. i, ii, and iii, with 586 maps having so far appeared (Barcelona, 1923-24).

POPULAR LATIN

With Latin, as with all languages, there existed from the outset divergences between the written and spoken idioms affecting the vocabulary and various portions of the grammar.

The name Popular Latin, especially applied to the spoken language with all its individual and dialectal idiosyncrasies, was also termed *inconditus*, *cotidianus*, *usualis*, *vulgaris*, *plebeius*, *proletarius* and *rusticus*, as opposed to the written language from which it was progressively differentiated by the operation of social influences and the growth of literature. Thus the contact of Latin with Greek, and particularly Greek philosophy, science and art, resulted in the coinage of learned terms, e.g., *epistola*, *grammatica*, *schola*, *stylus*, *poeta*, *poesis*, *poema*, *pyrrhus*, *paraglyphis*, *heros*, *aer*, *aether*, *encusium*, *podagra*, *sarcophagus*, *horologium*. These were Greek words with Latin endings. In formation they were contrary to the genius of the native Latin which enriched its word-stock by its traditional system of composition and derivation, especially by means of suffixes, destined to play such an important rôle in the romance languages. Till the end of the 1st century A.D. however, the classical language withstood the assaults of Popular Latin which it dominated in some degree by the prestige of its literary masterpieces, by the exigencies of the administration which compelled all officials to employ the higher language, and by the influence of the schools in which teaching was given in the *sermo urbanus*. But, with the passing of the golden age, the written language became even more artificial. When in A.D. 212 Caracalla conferred by edict the dignity of Roman citizenship upon all free-born inhabitants of the Empire, he introduced into Rome, according to the picturesque phrase of Isidore of Seville (Origines, ii. 31) "*vitia et verborum et morum*" (sins of speech and morality) and thenceforth the evolution of Popular Latin in all provinces, as far as we can trace, proceeded to all intents unchecked conformably with its inherent character. Two fresh historical factors next intervened, hastening the downfall of classical Latin, the religious revolution and the invasions of the Barbarians. Of the Christian propagandists the vast majority belonged to the lower classes; among the most zealous were many slaves and women, the language they used was essentially popular and even the educated among them found that to carry out their evangelisation efficiently they must resort to the vulgar tongue. The greatest of the Fathers of the Church, notwithstanding he had been a professor of rhetoric, wrote without hesitating: "Non timeamus ferulas grammaticorum, dum tamen ad veritatem solidam et certiorum perveniamus. Melius est quod reprehendunt nos grammatici quam non intelligant populi." (St. Augustine, *Enarrationes in Psalmos*, 138, 20.) "We don't fear the schoolmaster's cane if only we can arrive at a sure and more weighty truth. It were better to be reproved by the pedants than to be not understood by the people." Pope Gregory the Great appeals to Almighty God against the tyranny of the declensions: "*Casus servare con-*

temno quia indignum vehementer existimo ut verba coelestis oraculi restringam sub regulis Donati." (*Praefatio*, Job, i. 6.) "I refuse the slavery of the declensions because I think strongly that it is not fitting that I should force the words of the Divine Message into the rules of Donatus."

The anarchy which ensued when the Roman empire was overthrown proved eminently favourable to the growth of dialects and special idioms. Vulgar Latin and pre-literary Romance was a spoken language, but can in some measure be reconstituted from the information derived from the treatises composed by grammarians, the Latin Bible, the early Latin manuscripts, inscriptions, collection of formulae of the laws of the Barbarians, divers glossaries, literary, historical and technical texts ranging from the 4th to the 8th century, and the coins and charters of the Merovingian and Carolingian epochs. Thus the *Appendix Probi* (most probably of the 3rd century) contains remarks on declension, conjugation, orthography and the meaning of words. It is a kind of manual of "don'ts," interesting from the philological standpoint precisely on account of the forms quoted as mistakes to be avoided. The mention *porphireticum marmor* *is purpureticum marmor* attests the popular pronunciation of *ph*, in which Vulgar Latin dropped the aspiration, and the confusion of *o* and *u*; *speculum* *is speculm* shows the dropping in popular pronunciation of the post-tonic vowel in proparoxytones; *pecten* *is pectinis* instances a nominative formed by popular analogy. The *Glossary of Reichenau* (the ms. dates from the 8th century) translates certain words of the Vulgate no longer understood by words which, although given Latin case or verb inflexions, belonged in fact to a dialect of Northern western France. Thus in the sentence "Sed et serpens erat callidior" (Genesis iii., 1) *callidior* is rendered by *vitiolior*. This means that *callidus* had ceased to be intelligible (*callidus* has in fact totally vanished from the romance languages), and that *vitiolus* had taken its place in Vulgar Latin (*vitiolus* survives indeed in Italian *venoso*, Spanish and Portuguese *vicioso*, and is represented in Old French by *vitois*).

The material is both scarce and scanty, despite the richness and variety of the dialects spoken in all parts of the Roman empire. Reconstruction must in many cases resort to the comparative method. Thus, take the name for "finch" in various romance languages, *pincone* in Tuscan, *pinsuni* in Sicilian, *pinson* in French, *pinsó* in Catalan, *pinsón* in Spanish; comparison of these differing forms shows that all are derived from a common prototype which can be reconstituted as *pinconem*. Again if we take the words for "to advance," *avanzare* in Italian, *avansar* in the Engadine dialect, *vansó* in Frioul, *avansar* in Provençal and Catalan, *avancer* in French, there can be no doubt as to the legitimacy of our reconstituting a prototype verb *abantiare* formed from the Latin *ante*.

General Characteristics of the Romance Languages.

—After an evolutionary process occupying some three centuries Popular Latin had taken on an individual character according to the different regions of the Roman world in which it was spoken, and the dawn of "romance" may be regarded as coincident with the 8th century.

1. **Vocabulary.**—The Romance languages retained only negligible traces of the idioms originally spoken in their various territories before the advent of Latin. In French not more than fifty words can be traced back to Celtic; in Spanish the number of Iberian terms is no greater; in Northern Italian there are but infinitesimal relics of Osco-Umbrian and Celtic; in Southern Italian and Sicilian a few traces of Greek. As regards the Rhetic and Rumanian words which are ascribed to the primitive tongues of the Dacians, Thracians and Illyrians, the identification rests on practically indemonstrable hypotheses. The most important additions to the vocabularies of the romance languages come, for the occidental portion, from Germanic, Greek and Arabic, and, for the oriental portion, from Slavonic. The Germanic contribution embraces terms dealing with war, military art, costume, rural life and parts of the body, a few abstract terms and a great quantity of proper names. It is peculiarly important in French by reason of the Frankish invasion of Gaul and the influence exerted by the Merovingian and Carolingian kings who

were of Germanic origin. The Greek element during the middle ages, was of only slight importance, and was restricted to terms brought back by the Crusaders in the 11th and 12th centuries, or incorporated as a result of the commercial relations between Orient and Occident. The influx of Greek words was accelerated in the 14th century and with the 19th century became very abundant. The Arabic element is particularly important in Spanish, Portuguese and Provençal; many terms have percolated into Italian, and about three hundred are extant in Modern French. Finally at various periods other languages have supplied contributions, and there has been a continuous interpenetration between the different romance languages themselves. All romance languages contain (a) popular words, *i.e.*, derived by slow evolution from Popular Latin; (b) words of learned formation, *i.e.*, borrowed direct from ancient or modern languages. In some cases the same original word has yielded two derivatives belonging to *a* or *b* respectively.

2. **Phonetics.**—The general law applying to all romance languages is that the incidence of the tonic accent remains as in Popular Latin. All popular words are therefore stressed at the same point as they were eighteen centuries ago; as in some romance languages the vowels have persisted much as they were during the Imperial epoch, a modern Italian or Spaniard pronounces some words almost exactly as did a subject of Marcus Aurelius or Commodus. The atonic or intertonic vowels have weakened, or in some of the romance languages disappeared (except *a*). Proparoxytones have tended to become paroxytones, but many have survived in Italian and Rumanian, a few in Spanish; a small number existing in Old French were gradually eliminated during the middle ages. French and Portuguese have evolved nasal vowels unknown in Latin; the *u* sound, also unknown in Latin, is found in French, Provençal, and the Northern Italian and Engadine dialects. Initial consonants have, in general, suffered no change. In Spanish, however, *b* has developed into an intermediary sound between *b* and *v*, whilst *c* + *e* or *i* is pronounced like English voiceless *th* and *j* has become a velar fricative. In French *c* + *a* has given rise to the sound *ch*, (*e.g.*, *campus* > *champ*) and *g* + *a* to the sound *j* (*e.g.*, *gaudia* > *jole*); *h* has totally disappeared. The intervocalic consonants have proved less resistant; *b* has passed to *v* in all romance languages (even when orthographed *b* as in Spanish and Gascon, it is pronounced with the intermediary sound). Final *m* and *n* have disappeared apart from some rare exceptions (*Sp. quien*, *F. rien*) and *ns* has been reduced to *s*, processes of which signs are already visible in classical Latin. (Rumanian offers many peculiarities: see RUMANIAN LANGUAGE AND LITERATURE.)

3. **Morphology.**—The following features set forth the double character which prevailed in the evolution of the romance languages (a) the modification of the declension and conjugation system, (b) the development of the analytical tendencies of romance as opposed to the synthetic character of classical Latin. The neuter has disappeared from all romance languages; a few relics of it still survived in the mediaeval period. The term "neuter" used in Rumanian to designate the third declension applies to substantives conforming to the masculine declension in the singular and to the feminine declension in the plural, *e.g.*, *un cutit* (a knife), *niste cutite* (knives). The two-case system of declension (nominative and accusative) characterising the early period of some romance languages (French, Provençal and perhaps Rhaeto-Romanic) has disappeared (see RUMANIAN LANGUAGE AND LITERATURE); substantives and adjectives now possess only a single case in the singular and in the plural. More numerous traces of declension are preserved by the personal and relative pronouns. The definite article and personal pronoun of the third person are in all romance languages derived from *ille* (or *illud*), *illa*. The cardinal numbers 1 to 10 correspond in all romance languages to the Latin cardinals, but from 11 onwards there are varied divergences. A noteworthy feature of French is the use of *20* as multiplier. The synthetic comparatives and superlatives have mostly been ousted by *magis* or *plus* preceding the positive, *e.g.*, *grandior*, *grandissimus*, replaced by *magis* or *plus grandis*. The tense paradigms have been profoundly modified; the future and conditional

of occidental romance languages are derived from new Vulgar Latin creations which substitute for the synthetic classical *amabo*, *amareo*, forms made up of infinitive + (*h*)*abeo* (*amare* + [*h*]abeo) for the future, and of infinitive + (*h*)*abebam* (*amare* + [*h*]abebam) for the conditional. In Italian, however, the prototype of the conditional was infinitive + (*h*)*abui* (*amare* + [*h*]abui). In Rumanian and the Rhetic idioms the future and conditional are periphrastic. Romance languages have further evolved a new perfect and pluperfect based on Latin (*h*)*abui* and (*h*)*abebam* + past participle: (*h*)*abui* + *amatum* and (*h*)*abebam* + *amatum*. The imperative either perpetuates the Latin forms (somewhat curtailed), as in Italian, or replaces the plural by indicative or subjunctive forms. The infinitives in *-are* and *-ire* have evolved regularly; but those in *-ere* and *-ere* have suffered varying fates in the different romance languages. As to past participles, most striking is the extension of forms in *-itus* at the expense of those in *-itus* and *-itus*. In the personal flexions of the various tenses analogy has worked many changes; *e.g.*, in Italian and Rumanian the second person singular of all tenses ends in *-i*. Romance retains no vestige of the deponent verbs, all of which have been assimilated to active verbs, *e.g.*, *nasci* has become *nascere*. Romance has substituted for the synthetic tenses of the passive voice, a periphrasis compounded from the different forms of *essere* (Vulgar Latin for *esse*) or of *stare* + past participle.

4. **Syntax.**—Evolution has been towards a more rational and logical word-order and stricter connection both of clauses and of words. Many new syntactical features are closely correlated with the modifications mentioned in 2 and 3. There has been constant action and reaction between phonetics, morphology and syntax. If the structure of the Romance sentence is compared with that of the Latin sentence the salient innovations observable are (a) the normal constructional order subject, verb, complement, replacing the elaborate artifices of classical Latin which had gradually disappeared in Vulgar Latin; (b) the substitution of the relative clause of the Vulgar Latin type, *credo quod* (or *quem* or *quatenus*) for the infinitive construction *e.g.*, *credo quod illum verum esse* for *credo illum verum esse*; (c) increase in use and number of prepositions which in Vulgar Latin perform the functions of the lost genitive, dative and ablative cases; (d) creation of a definite article (from *ille*, *illa*) and an indefinite article (from *unus*, *una*); (e) increase in number of tenses permitting greater precision in expression of the past (past anterior, past imperfect and past conditional); (f) ingenious devices for formation of adverbs and prepositions more adequately expressing the shades of abstract thought, *e.g.*, French, *en*, *ens*, *dans*, *dedans*, corresponding respectively to *in*, *intus*, *de* + *intus*, *de* + *de* + *intus*; (g) complexity of certain interrogative forms best exemplified by the French equivalent for the Latin *Quid est?*: *Qu'est-ce que c'est que cela?* the etymological counterpart of which would be: *Quid est eccehoc quod eccehoc est quod ecce illac?* (Example quoted from the *Dictionnaire Général*).

ROMAN DE LA ROSE, a French poem of which the first part was written about 1230 by Guillaume de Lorris (*q.v.*), and which was completed about 40 years later by Jean de Meun (*q.v.*). Guillaume de Lorris wrote an allegory, which is an artistic presentment of the love philosophy of the troubadours. In a dream the Lover visits a park to which he is admitted by Idleness. In the park he finds Pleasure, Delight, Cupid and other personages, and at length the Rose. Welcome grants him permission to kiss the Rose, but he is driven away by Danger, Shame, Scandal, and especially by Jealousy, who entrenches the Rose and imprisons Welcome, leaving the Lover disconsolate. The story, thus left incomplete, was finished in 19,000 lines by Jean

de Meun, who allows the Lover to win the Rose, but only after a long siege and much discourse from Reason, the Friend, Nature and Genius. In the second part, however, the story is entirely subsidiary to picturesque and poetic digressions, and to violent satire in the manner of the fabliaux against the abuse of power, against women, against popular superstition, and against the celibacy of the clergy. The length of the work and its heterogeneous character proved no bar to its enormous popularity in the middle ages, attested by the 200 mss. of it which have survived.

The *Romaan of the Rose* was translated into English by Chaucer (see the prologue to the *Legende of Good Women*), but the version which has come down to us (see an edition by Dr. Max Kaluza, Chaucer Society, 1892), is generally admitted to be by another hand. For a list of books on the authorship of the English translation see G. Körting, *Grundriss der engl. Lit.* (Münster, 1905, 4th ed. p. 184). Three editions of the *Roman de la Rose* were printed at Lyons between 1473 and 1490; two by Antoine Verard (Paris, 1490? and 1496?), by Jean du Pré (Paris, 1493?), by Nicholas Desprez for Jean Petit (Paris), by Michel le Noir (Paris, 1509 and 1519). In 1503 Jean Molinet produced a prose version Marot modernized the text (1546), and his corrections were followed in subsequent editions. There is a modern English version by F. S. Ellis (3 vols., 1900).

ROMAN-DUTCH LAW. The term Roman-Dutch law describes the system of law which existed in the province of Holland (see HOLLAND) from the 15th to the 19th centuries. This system, introduced by the Dutch into their colonies, was retained in those of them which passed to the British Crown at the end of the 18th and the beginning of the 19th centuries. These were the maritime districts of Ceylon, the Cape of Good Hope, and the settlements upon the coast of South America now comprised within the colony of British Guiana. In a secondary sense therefore Roman-Dutch law is the original common law of these countries. In Ceylon this system has been extended to the Kandyan Provinces (annexed in 1815), while in South Africa it was carried forward with the expanding range of white settlement into the Republics and Natal. To-day it is in force in the whole of British Africa south of the Zambezi, as well as in the Mandated Territory, known as the Protectorate of South-West Africa.

In British Guiana on the other hand the Roman-Dutch law having been found unsuited to the existing conditions of the colony has by the local Civil Law of British Guiana Ordinance 1916, taking effect from Jan. 1, 1917, been to a very great extent replaced by the common law of England. When it is said that Roman-Dutch law forms the common law of British South Africa and Ceylon, this must be understood with a reservation in favour of native law and custom, so far as these are recognized, and with the qualification that the general law of these countries, as will be seen, has in many respects departed from its original type.

Historical Development.—It does not fall within the scope of this article to investigate the historical sources of the old Dutch law. It is enough to say that in the 15th and 16th centuries the Roman law was "received" *in subsidium* in the province of Holland, as it was sooner or later in the Netherlands generally, as well as in Germany. General and local customs, based ultimately upon Germanic tribal law (Frankish, Frisian, Saxon), afforded by privileges and by-laws (*keuren*), and affected, doubtless, by an earlier "infiltration" of Roman law, held their ground. Hence resulted the mixed system for which Simon van Leeuwen in 1652 invented the term "Roman-Dutch law." This remained in force until superseded in 1809 by the Code Napoléon, which in 1838 gave place to the existing Dutch civil code. The old law was abrogated in the Dutch colonies also, so that to-day the Roman-Dutch law is no longer in force outside the British empire. (See ROMAN LAW.)

We have spoken of two elements in the Roman-Dutch system, Roman law and Germanic custom. To these must be added a third, viz., legislative acts of the Burgundian and Spanish periods. Such were the Great Privilege of Mary of Burgundy of 1476; the Placaat of the emperor Charles V. of 1529, requiring immovable property to be transferred before the local court; the Perpetual Edict of the same monarch of 1540, relating to clandestine marriages and other matters; the Maritime Laws of Charles V. of 1551 and of Philip II. of 1563; the Codes of Criminal and Civil

Procedure of Philip II. of 1570 and 1580; the Political Ordinance of the States of Holland of 1580; the Placaat on Intestate Succession of 1599. There was much legislation in the 17th and 18th centuries, but it had little effect upon the general character of the legal system. Apart from legislation we derive our knowledge of the Roman-Dutch law from collections of decided cases, from collections of opinions, commonly termed *consultatien* or *advijzen*, and from a rich juristic literature.

Systematization.—The first attempt to reduce the Roman-Dutch civil law to system was made by Hugo de Groot (Grotius) in his *Introduction to the Jurisprudence of Holland* (*Inleiding tot de Hollandische Rechts-geleertheit*), written while he was a prisoner in Loevestein in 1619–20, published in 1631. This short treatise, a masterpiece of condensed exposition, remains to this day a legal classic. But after Grotius honor must be assigned to Johannes Voet (1647–1713), professor at Utrecht and Leyden, whose *Commentarius ad Pandectas* (1698–1704) more than any work of the old law is in use to-day. In the 18th century the most famous name is Cornelius van Bijnkershoek, for 20 years president of the Supreme Court (1673–1743). Towards the end of the century Dionysius Godefridus Van der Keessel, professor at Leyden, lectured on the *ius hoderum*, of which he published a summary in *Theses selectae juris Hollandici et Zelandici* (1800). Copies of the lectures themselves, commonly known as Van der Keessel's *Dictata*, circulate in ms., and these have been cited in judgments of the South African Courts. A younger contemporary of Van der Keessel was Joannes van der Linden, the author of a popular textbook, *Rechtsgeleerd, Practicaal en Koopmans Handboek*. These two names conclude the list of the contemporary writers on the old Dutch law.

The Dutch carried to their colonies the law of the home country, just as the English took with them their common law, and subject to the same necessary adaptation to local conditions. In practice the law of the province of Holland was followed. Hence the extension to the colonial empire of the Roman-Dutch system of law. This was supplemented by local ordinances of the governors in council, and in the East Indies by laws made by the governor-general in council established at Batavia. These were collected by Van Diemen in 1642 and by Van der Parra in 1766. The supreme direction of the East India company was exercised by the Council of XVII and of the West India company by the Council of X. The ultimate legislative authority was vested in the States General.

In the British Empire.—When the Dutch colonies passed to the British Crown, the old law was in principle retained, but during the century and more which has since elapsed it has undergone profound modifications due partly to changed social and economic conditions, partly to the incursion of rules and institutions derived from English law. In commercial matters, in particular, English influences have been predominant. This was so even in the South African republics, and after annexation their law was brought into closer harmony with that of the neighbouring colonies.

The South Africa Act 1909 provided (sec. 135) for the continuance of all laws in force in the several colonies at the establishment of the Union until repealed by the Union parliament, or by the provincial councils within the sphere assigned to them. But since this Act took effect on May 31, 1910, the Union parliament and the appellate division of the Supreme Court of South Africa (which hears appeals not only from the Union, but also from Southern Rhodesia and the Mandated Territory) have been active in consolidating, amending and explaining the law, and will continue to introduce uniformity in place of diversity. Many of the rules of the old law have already been pronounced to be obsolete by disuse.

But, except where the field is occupied by statute or invaded by English law, the law of South Africa (and in a less degree the law of Ceylon) retains the character of a Roman law system. In many departments of the law the texts of the *Corpus Juris* are still cited as authoritative. The approach to them is through the writings of the Dutch jurists, Grotius, van Leeuwen, Voet, van der Keessel, van der Linden and the rest. The influence of English

law has been profound, most of all in British Guiana, where its victory has been complete, less in Ceylon, least in South Africa. But at some points the Roman-Dutch law has offered a stubborn resistance. Thus, it is now settled for both South Africa and Ceylon that "consideration" is not necessary to the validity of a contract. South Africa (but not Ceylon) retains almost unchanged the old law of community of goods with its consequences in the proprietary relations of the spouses.

Upon a general view it must be said that a system of law, which can draw at the same time upon the treasures of the Roman and of the English law has great elements of strength, particularly in a virile and progressive community. But the need to resort to law-books of by-gone centuries is a serious inconvenience.

ROMAN EMPIRE, LATER. The reign of Constantine the Great forms the most deep-reaching division in the history of Europe. The external continuity is not broken, but the principles which guided society in the Greek and Roman world are replaced by a new order of ideas. Emperor-worship, which expressed a belief in the ideal of the earthly empire of Rome, gives way to Christianity; this is the outward sign that a mental transformation, which we can trace for 300 years before in visible processes of decay and growth, had reached a crisis.

Besides the adoption of Christianity, Constantine's reign is marked by an event only second in importance, the shifting of the centre of gravity of the empire from the west to the east by making Byzantium a second capital, a second Rome. The foundation of Constantinople (q.v.) determined the subsequent history of the State; it established permanently the division between the eastern and western parts of the empire—a principle already introduced—and soon exhibited, though not immediately, the preponderance of the eastern half. The eastern provinces were the richest and most resourceful, and only needed a Rome in their midst to proclaim this fact; and further, it was eastward that the empire fronted, for here was the one great civilized State with which it was in constant antagonism. Byzantium was refounded on the model of Rome, had its own senate, and presently a *præfectus urbi*. But its character was different in two ways: it was Christian and it was Greek. From its foundation New Rome had a Christian stamp; it had no history as the capital of a pagan empire. There was, however, no intention of depressing Rome to a secondary rank in political importance; this was brought about by the force of circumstances.

The Christian Roman empire, from the first to the last Constantine, endured for 1,150 years, and during that long period, which witnessed the births of all the great modern nations of Europe, experienced many vicissitudes of decline and revival. In the 5th century it lost all its western provinces through the expansion of the Teutons; but in the 6th asserted something of its ancient power and won back some of its losses. In the 7th it was brought very low through the expansion of the Saracens and of the Slavs, but in consequence of internal reforms and prudent government in the 8th century was able before the end of the 9th to initiate a new brilliant period of power and conquest. From

the middle of the 11th century a decline began; besides the perpetual dangers on the eastern and northern frontiers, the empire was menaced by the political aggression of the Normans and the commercial aggression of Venice; then its capital was taken and its dominions dismembered by Franks and Venetians in 1204. It survived the blow for 250 years, as a shadow of its former self.

During this long life its chief political rôle was that of acting as a defender of Europe against the great Powers of western Asia. While it had to resist a continuous succession of dangerous enemies on its northern frontier in Europe—German, Slavonic, Finnic and Tatar peoples—it always considered that its front was towards the east, and that its gravest task was to face the Powers which successively inherited the dominion of Cyrus and Darius. From this point of view we might divide the external history of the empire into four great periods, each marked by a struggle with a different Asiatic power. (1) with Persia, ending c. 630 with the triumph of Rome; (2) with the Saracens, who ceased to be formidable in the 11th century; (3) with the Seljuk Turks, in the 11th and 12th centuries; (4) with the Ottoman Turks, in which the Roman power went down.

Mediaeval historians, concentrating their interest on the rising States of western Europe, often fail to recognize the position held by the later empire and its European prestige. Up to the middle of the 11th century it was in actual strength the first Power in Europe, except in the lifetime of Charles the Great, and under the Comneni it was still a power of the first rank. But its political strength does not express the fullness of its importance. As the heir of antiquity it was confessedly superior in civilization, and it was supreme in commerce. Throughout the whole period (to 1204) Constantinople was the first city in the world. The influence which the empire exerted upon its neighbours, especially the Slavonic peoples, is the second great rôle which it fulfilled for Europe—a rôle on which perhaps the most speaking commentary is the doctrine that the Russian Tsar was the heir of the Roman Caesar.

HISTORICAL SKETCH

Diocletian's artificial experiment of two Augusti and two Caesars had been proved a failure, leading to 20 years of disastrous civil wars; and when Constantine the Great (q.v.) destroyed his last rival and restored domestic peace, he ruled for the rest of his life with undivided sway. But he had three sons, and this led to a new partition of the empire after his death, and to more domestic wars, Constantius first annexing the share of Constantine II. (340) and becoming sole ruler of the west, to be in turn destroyed by Constantius II., who in 350 remained sole sovereign of the empire. Having no children, he was succeeded by his cousin, Julian the Apostate (q.v.). This period was marked by wars against the Germans, who were pressing on the Rhine and Danish frontiers, and against Persia. Julian lost his life in the eastern struggle, which was then terminated by a disadvantageous peace. But the German danger grew graver, and the battle of Adrianople, in which the Visigoths, who had crossed the Danube in consequence of the coming of the Huns (see GOTHIS and HUNS), won a great victory, and the emperor Valens perished (378), announced that the question between Roman and Teuton had entered on a new stage. Theodosius the Great saved the situation for the time by his Gothic pacification. The efforts of a series of exceptionally able and hard-working rulers preserved the empire intact throughout the 4th century, but the dangers which they weathered were fatal to their weaker successors. On the death of Theodosius the decisive moment came for the expansion of the Germans, and they took the tide at the flood. There were three elements in the situation. Besides the Teutonic peoples beyond the frontier there were dependent people who had settled within the empire (as Visigoths in Moesia, Vandals in Pannonia), and further there were the semi-Romanized Germans in the service of the empire, some of whom had risen to leading positions (like Merobaudes and Stilicho). A Germanization of the empire, or part of it, in some shape was inevitable, but, if the rulers of the 5th century had been men of the same stamp as the rulers of the 4th, the process might have assumed a different form. The sons

of Theodosius were both incapable; and in their reigns the future of the State which was divided between them was decided. The dualism between the east, (under Arcadius) and the west (under Honorius) developed under the rule of these brothers into antagonism verging on hostility. The German danger was averted in the east, but it led in a few years to the loss of many of the western provinces, and at the end of 90 years the immediate authority of the Roman emperor did not extend west of the Adriatic. The reign of Honorius saw the abandonment of Britain, the establishment of the Visigothic kingdom in Aquitaine, the occupation of a great part of Spain by Vandals and Sueves (Suebi). Under Valentinian III. the Vandals founded their kingdom in north Africa, the Visigoths shared Spain with the Sueves, the Burgundian kingdom was founded in south-east Gaul. The last Roman possession in Gaul passed to the Franks in 486 (*see* GOTHs; VANDALS; FRANKS). It is significant that the chief defenders of the empire against the Germans who were dismembering it were men of German race, Stilicho, who defended Italy against Alaric, Aëtius, whose great work was to protect the imperial possessions in Gaul, and Ricimer. It was also a German, Fravitta, who played a decisive part in suppressing a formidable Gothic movement which menaced the throne of Arcadius in 399-400. It was characteristic of this transformation of Europe that the Germans, who were imbued with a profound reverence for the empire and its prestige, founded their kingdoms on Roman soil in the first instance as "federates" of the emperor, on the basis of formal contracts, defining their relations to the native provincials; they seized their dominions not as conquerors, but as subjects. The double position of Alaric himself, as both king of the Visigoths and a *magister militum* of the empire, is significant of the situation.

The development of events was complicated by the sudden growth of the transient empire of the Huns (*q.v.*) in central Europe, forming a third great power, which, reaching from the Rhine to the Caucasus, from the Danube to the Baltic, might be compared in the extent of its nominal supremacy, but in nothing else, to the empires of Rome and Persia. The Huns, whose first appearance had precipitated the Germans on the empire, now retarded for some years the process of German expansion, while they failed in their own attacks upon the empire. On Attila's death (453) his realm collapsed, and his German vassals (Ostrogoths, etc.) founded important kingdoms on its ruins.

After the death of Valentinian III., the worst of his house, the Theodosian dynasty expired in the west, and the authority of the western emperors who succeeded him in rapid succession reached little beyond Italy. For most of this period of 20 years the general Ricimer, of German birth, held the scales of power in that peninsula, setting up and pulling down emperors. After his death the western throne was no longer tenable. First there was a usurpation; the general Orestes set up his child-son Romulus Augustulus against the legitimate Augustus, Julius Nepos, who was acknowledged by the eastern emperor; but this temporary Government was overthrown (476) by a Germanic military revolution headed by Odoacer, who appropriated part of the soil to his German soldiers and founded an Italian kingdom under the nominal supremacy of the emperor at Constantinople, who, however unwilling, recognized his position (after the death of Nepos).

The escape of the eastern provinces from the fate of the western illustrates the fact that the strength of the empire lay in the east. These provinces were more populous and presented greater obstacles to the invaders, who followed the line of least resistance. But it was of immense importance that throughout this period the empire was able to preserve a practically unbroken peace with its great eastern rival. The struggle with Persia, terminated in 364 by the peace of Jovian, was not renewed till the beginning of the 6th century. It was of greater importance that the rulers pursued a discreet and moderate policy, both in financial administration and in foreign affairs; and the result was that at the end of 200 years the diminished empire was strong and consolidated. Theodosius II. was a weak prince, but his Government was ably conducted by Anthemius, by his sister Pulcheria and by the eunuch Chrysaphius. His reign was important for the Armenian ques-

tion. Theodosius I. had committed the error of consenting to a division of this buffer State in the Roman and Persian spheres of influence, Persia having much the larger. The Sassanid Government tried to suppress the use of the Greek language. But the Government of Theodosius II. officially supported the enterprise of translating the Bible into Armenian (Mesrob had just invented the Armenian alphabet), and this initiated the production of an abundant literature of translations from the Greek, which secured the perpetual connection of Armenia with European culture, and not with Oriental. This reign is also distinguished by the building of the great land walls of Constantinople, by the foundation of a university there and by the collection of the imperial laws in the *Codex Theodosianus*, which is a mine of material for the social condition of the empire. It reveals to us the decline of municipal liberty, the decay of the middle classes in the West, the evils of the oppressive fiscal system and an appalling paralysis of Roman administration which had once been so efficient; it shows how the best-intentioned emperors were unable to control the governors and check their corruption; and discloses a disorganization which facilitated the dismemberment of the empire by the barbarians.

In the reign of Zeno it seemed probable that an Ostrogothic kingdom would be established in the Balkan peninsula, but the danger was diverted to Italy (*see* GOTHs). The kingdom which Theodoric founded there was, in its constitutional aspect, a continuation of Odoacer's régime. He, like Odoacer and Alaric, held the double position of a German king and a Roman official. He was *magister militum* as well as *rex*. His powers were defined by capitulations which were arranged with the emperor Anastasius and loyally observed. The right of legislation was reserved to the emperor, and Theodoric never claimed it; but for all practical purposes he was independent.

Justinian.—In the 6th century the emperor Justinian, whose talents were equal to his ambitions, found himself, through the financial prudence of his predecessors, in a position to undertake the reconquest of some of the lost western provinces. The Vandal power had declined, and Africa was won back in one campaign by Belisarius in 533. The conquest of Italy was far more difficult. Begun by Belisarius in 535, it was not completed till 554, by Narses. A portion of southern Spain was also won from the Visigoths, so that the Romans again commanded the western straits. Justinian, possessed by large ideas and intoxicated with the majesty of Rome, aspired to be a great conqueror, a great lawgiver, a great pontiff, a great diplomatist, a great builder, and in each of these spheres his reign holds a conspicuous place in the annals of the empire. His legal work alone, or the building of Santa Sophia, was enough to ensure him immortal fame. But deep shadows balance the splendour. The reconquest of Africa was thoroughly justified and advantageous, but Italy was bought at a ruinous cost. In the first place, the Persian empire was at this time ruled by one of its greatest kings, Chosroes I. (*q.v.*), who was far from peacefully inclined. Justinian was engaged in a long Persian and a long Gothic war at the same time, and the State was unequal to the strain. In the second place, it was all-important for his western policy to secure the goodwill of the Italian provincials and the Roman bishop, and for this purpose he involved himself in an ecclesiastical policy (*see* below) which caused the final alienation of the Syrian and Egyptian provinces. The reconquest of the West was purchased by the disunion of the East. Thirdly, the enormous expenses of the Italian and Persian wars, augmented by architectural undertakings, caused a policy of financial oppression which hung as a cloud over all the brilliance of his reign, and led to the decline which ensued upon his death. Nor is it to be forgotten that he had at the same time to fulfil the task of protecting the Danube against the Germans, Slavs and Bulgarians, who constantly threatened the Illyrian provinces. He spared no expense in building forts and walls. Justinian's name will always be associated with that of the gifted Theodora, an actress of doubtful fame in her early life, who shared his throne. Their mosaic portraits are preserved in the contemporary church of San Vitale at Ravenna. She possessed great political influence, and the fact that she was a heretic (monophysite), while Justinian was devoted to orthodoxy, did

not mar their harmony, but only facilitated the policy of extending secret favour to the heretics who were publicly condemned, and enabled the left hand to act without the knowledge of the right. The events of the half-century after Justinian's death exhibited the weakness to which his grandiose policy had reduced the empire. It was attacked on the west, on the north and on the east, and at all points was unequal to coping with its enemies. (1) Italy fell a victim to the Lombards (*q.v.*), and in a few years more than half of the peninsula had passed under their sway. (2) The Avars, a Hunnic people who had advanced from the Caspian, took possession of Pannonia and Dacia, and formed an empire, consisting of Slavonic and Bulgarian subjects, which endured for about 60 years. Their chief occupation was to invade the Illyrian peninsula and extort tribute and ransoms from the emperors. So far as the Avars themselves were concerned, these incursions had no permanent significance, but the Slavs who overran the provinces did more than devastate. These years saw the beginning of the Slavonic settlements which changed the ethnical character of the peninsula, and thus mark the commencement of a new period. Slavs occupied Moesia and a large part of Macedonia, even close to Thessalonica, which they besieged; they penetrated southward into Greece and made large settlements in the Peloponnese (*see GREECE, History, "Roman period," ad fin.*). They occupied the north-western provinces, which became Croatia and Servia, as well as Dalmatia (except some of the coast towns). In the northern part of the peninsula the Slavonic element remained dominant, but in Greece it was assimilated to the Greek (after the 9th century) and has left little record of itself except in place names. (3) The empire was simultaneously engaged in the perennial strife with Persia. A short interval of peace was secured when the emperor Maurice assisted Chosroes II. to de-throne a usurper, but after Maurice's death (602) the final and mortal struggle began (*see PERSIA: History: History of the Sassanian Empire*). Throughout the incompetent reign of Phocas the eastern provinces were overrun by the Persians, as the Illyrian were overrun by the Slavs. The unpopular rule of this cruel usurper was terminated in 610 by the intervention of the governor of Africa, whose son Heraclius sailed to Constantinople and, welcomed by an influential party, met with little resistance. Phocas, murderer of Maurice, was murdered by the people, and the victor was crowned emperor to find himself in presence of a desperate situation. Antioch, Damascus and many other great cities were captured by the Persians; and in 614 Jerusalem was destroyed and the Holy Cross, along with the patriarch, carried off to Ctesiphon. This event produced a profound sensation in Christendom. In 616 Egypt was conquered. The army had fallen into utter disorder under Phocas, and Heraclius so deeply deplored of saving Constantinople that he thought of transferring the imperial capital to Carthage. But the extreme gravity of the situation seems to have wrought a moral change among his subjects; the patriarch Sergius was the mouthpiece of a widespread patriotic feeling, and it was largely through his influence that Heraclius performed the task of creating a capable army. His efforts were rewarded in a series of brilliant campaigns (622-628), which, in the emphasis laid on the contrast between Christianity and fire-worship and on the object of recovering the Cross, had the character of crusades. Heraclius recovered his provinces and held Persia at his mercy (decisive battle at Nineveh, end of 627).

This war is remarkable for the attempt of the Persians to take Constantinople (626) in conjunction with the Avars and Slavs. Soon afterwards the Avar power began to decay, and the Slavs and Bulgarians shook off their yoke. It seemed as if the Roman Government would now be able to regain the control in the Illyrian lands which it had almost entirely lost. It seems probable that Heraclius came to terms with the Slavs—Croats and Servians—in the north-west; their position was regularized, as vassals of the empire. But fate allowed no breathing-time to do more; the darkest hour had hardly passed when a new storm-cloud, from an unexpected quarter, overspread the heavens.

At this point we have to note that the Hellenic element in the State had definitely gained the upper hand before the end of the 6th century, so that henceforward the empire might be

described as Greek. Justinian's mother-tongue was Latin, and he was devoted to the Latin traditions of Rome, but even he found it necessary to publish his later laws in Greek and from his reign Greek was the official language.

Rise of Islam.—With the rise of Islam (*see CALIPHATE; MOHAMMED*) two universal religions, for the first time, stood face to face, each aspiring to win the universe. The struggle, therefore, which then began was not only a new phase of the strife between Europe and Asia, but was one in which the religious element was fundamental. Fire-worship was only a national religion and did not present the danger of Islam. The creation of the political power of the Mohammedans was so sudden that it took the world by surprise. Bostra, the fortress of Roman Arabia, fell into their hands in 634, and before the death of Heraclius in 641 they had conquered Syria and all Egypt, except Alexandria, which opened its gates to them in 643. The religious alienation of the Syrian and Egyptian peoples from Constantinople, expressing as it did a national sentiment antagonistic to the Greeks, was an important political factor in the Mohammedan (as in the previous Persian) conquest. Thus the Mohammedans definitely cut the empire short in the East, as the Germans had cut it short in the West; Egypt was never recovered, Syria only for short periods and partially, while the integrity of Asia Minor was constantly menaced and Cilicia occupied for many generations. By their conquest of Persia the Caliphs succeeded to the position of the Sassanids; this led to the conquest of Armenia (*c. 654*); while in the West, Africa was occupied in 647 (though the conquest was not completed till the capture of Carthage and other strong places in 698). Thus within 20 years from the first attack the empire was girt about by the new aggressive power from the precincts of the Caucasus to the western Mediterranean.

Fortunately Constant II., grandson of Heraclius, was a man of eminent ability and firmness. The State owed to him the preservation of Asia Minor, and the creation of a powerful fleet (*see below*) which protected the Aegean coasts and islands against the naval power which the Mohammedans created. He was responsible for completing a new, efficient military organization, which determined the lines of the administrative reforms of Leo III. (*see below*). In his last years he turned his eyes to Italy and Africa. He dreamed of restoring Old Rome as the centre of the empire. But he did not succeed in recovering south Italy from the Lombards (Duchy of Beneventum), and having visited Rome he took up his residence in Syracuse, where he was assassinated, having lost two fleets which he sent against the Arabs of Africa. The strain lasted for another 50 years. Constantinople sustained two great sieges (673-677 and 717-718) which stand out as crises, for, if in either case the enemy had been successful, the empire was doomed.

The Heraclian dynasty, which had fallen on evil times and rendered inestimable services to the empire, came to an end in anarchy, which was terminated by the elevation of the Syrian (commonly called Isaurian) Leo III., whose reign opens a new period. His reforming hand was active in every sphere of government, but the ill-fame which he won by his iconoclastic policy obscured in the memory of posterity the capital importance of his work. His provincial organization was revolutionary, and his legislation departed from the Roman tradition (*see below*). From his reign to the middle of the 10th century the continuous warfare by land with the Caliphs consisted of marauding expeditions of each power into the other's territory, captures of fortresses, guerrilla fighting, but no great conquests or decisive battles. The efficiency of the army was carefully maintained, but the neglect of the navy led to the losses of Crete (conquered by Muslim adventurers from Spain 826) and Sicily (conquered by the Saracens of Africa). Panormus was taken in 832, Syracuse in 878 (*see SICILY*). The Africans also made temporary conquests, including Bari, in south Italy. This period saw the loss of the exarchate of Ravenna to the Lombards (750), the expansion of the Frankish power under Pippin and Charlemagne in Italy, and in close connection therewith the loss of Old Rome.

The iconoclast emperors pursued a moderate foreign policy, consolidating the empire within its contracted limits; but under

the "Macedonian" dynasty, which was of Armenian descent, it again expanded and became the strongest power in Europe. The 9th century also witnessed a revival of learning and culture which had been in eclipse for 200 years. The reign of Basil I was marked by an energetic policy in south Italy, where his forces co-operated with the western emperor Louis II. The Saracens were expelled from their strongholds, Bari was recovered, Calabria saved, and the new province (Theme) of Longibardia formed. This secured the entrance to the Adriatic, and the increase of dominion here at the expense of the Lombards was a compensation for the loss of Sicily. Leo VI did much for reorganizing the navy, but his reign was not fortunate; Saracen pirates plundered freely in the Aegean and, under the able renegade Leo of Tripolis, captured Thessalonica and carried off countless captives (904). But a great tide of success began 50 years later. Nicephorus Phocas won back Crete (961) as general of Romanus II, and then as emperor recovered Cilicia and North Syria (with Antioch) 968. Cyprus was also recovered. The tide flowed on under his equally able successor, John Zimisces (of Armenian race) and under Basil II; these reigns mark the decisive victory of the empire in the long struggle with the Saracens, whose empire had been broken up into separate States. The eastern frontier was strengthened by the active policy of Basil II in Armenia, which was more fully incorporated in the empire under Constantine IX.

Basil II.—The reign of Basil II. marks the culmination of the power of the Eastern empire, for it also witnessed the triumphant conclusion of another conflict which had lasted almost as long. In the reign of Constantine IV. the Bulgarians (*see* BULGARIA) had founded a kingdom in Lower Moesia, reducing the Slavonic tribes who had occupied the country, but less than two centuries sufficed to assimilate the conquerors to the conquered, and to give Bulgaria the character of a Slavonic State. The reign of Constantine V. was marked by continuous war with this enemy, and Nicephorus I. lost his life in a Bulgarian campaign. This disaster was followed up by Prince Krum, who besieged Constantinople in 815. His death was followed by a long peace. Prince Boris was converted to Christianity (reign of Michael III.); a metropolitan see of Bulgaria was founded, dependent on the patriarch of Constantinople; and the civilization of the Bulgarians, and beginnings of their literature, were entirely under Byzantine influence. The conversion was contemporary with the work of the two missionaries Cyril and Methodius, who (while the field of their personal activity was in Great Moravia and Pannonia) laid the south-eastern Slavs under a deep debt by inventing the Glagolitic (*q.v.*), not the so-called "Cyrillic" alphabet (based on Greek cursive) and translating parts of the Scriptures into Slavonic (the dialect of the Slavs of Macedonia). The most brilliant period of the old Bulgarian kingdom was the reign of Simeon (893-927), who extended the realm westward to the shores of the Adriatic and took the title "Tsar (*ie.*, Caesar) of Bulgaria and autocrat of the Romans." The aggression against the empire which marked his ambitious reign ceased under his successor Peter, who married a daughter of Romanus I., and the Bulgarian Patriarchate founded by Simeon was recognized at Byzantium. But the Byzantine rulers only waited for a favourable time to reduce this formidable Slavonic State. At length Zimisces subjugated eastern Bulgaria and recovered the Danube frontier. But while Basil II. was engaged in contending with rivals, the heroic Samuel (of the Shishmanid family) restored the Bulgarian power and reduced the Servians. After a long and arduous war of 14 years Basil (called the "Bulgar-slayer") subdued all Bulgaria western and eastern (1018). He treated the conquered people with moderation, leaving them their political institutions and their autonomous church, and to the nobility their privileges. Some Bulgarian noble families and members of the royal house were incorporated in the Greek nobility; there was Shishmanid blood in the families of Comnenus and Ducas. Greek domination was now established in the peninsula for more than 150 years. The Slavs of Greece had in the middle of the 9th century been brought under the control of the Government.

In the reign of Basil II. the Russian question also was settled. The Dnieper and Dniester gave the Russians access to the Euxine,

and the empire was exposed to their maritime attacks (Constantinople was in extreme danger in 860 and 941). In 945 a commercial treaty was concluded, and the visit of the princess Olga to Byzantium (towards the end of the reign of the learned emperor Constantine VII., Porphyrogenetos) and her baptism seemed a pledge of peace. But Olga's conversion had no results. Sviatoslav occupied Bulgaria and threatened the empire, but was decisively defeated by Zimisces (971), and this was virtually the end of the struggle. In 983 Prince Vladimir captured Cherson, but restored it to the emperor Basil, who gave him his sister Anna in marriage, and he accepted Christianity for himself and his people. After this conversion and alliance, Byzantium had little to fear from Kiev, which came under its influence. One hostile expedition (1043) indeed is recorded, but it was a failure. Much about the same time that the Russians had founded their State, the Magyars (*see* HUNGARY; the Greeks called them Turks) migrated westward and occupied the regions between the Dnieper and the Danube, while beyond them, pressing on their heels, were another new people, the Petchenegs (*q.v.*). The policy of Byzantium was to make use of the Magyars as a check on the Bulgarians, and so we find the Romans (under Leo VI.) and the Magyars co-operating against the tsar Simeon. But Simeon played the same game more effectively by using the Petchenegs against the Magyars, and the result was that the Magyars before the end of the 9th century were forced to move westward into their present country, and their place was taken by the Petchenegs. From their new seats the Magyars could invade the empire and threaten the coast towns of Dalmatia. The conquest of Bulgaria made the Petchenegs immediate neighbours of the empire, and during the 11th century the depredations of these irreclaimable savages, who filtered into the Balkan peninsula, constantly preoccupied the Government. In 1064 they were driven from the Dniester regions into Little Walachia by the Cumans, a people of the same ethnical group as themselves. They were crushingly defeated by Alexius Comnenus in 1091, and disappear from history.

The Seljuk Turks.—In the Macedonian period a grave domestic question troubled the Government. This was the growth of the large estates of the rich nobles of Asia Minor, at the expense of small properties, to an excess which was politically and economically dangerous. The legislation against the evil began under Romanus I. and was directed to the defence of the poor against the rich, and to protecting the military organization which was based on holdings of land to which the obligation of military service was attached. There was also danger in the excessive influence of rich and powerful families, from which the great military officers were drawn, and which were extensively related by alliances among themselves. The danger was realized in the struggle which Basil II. had to sustain with the families of Sclerus and Phocas. Various kinds of legislation were attempted. Under Romanus I. alienation of property to the large landowners was forbidden. Nicephorus Phocas, whose sympathies were with the aristocracy to which he belonged, holding that there had been enough legislation in favour of the poor, sought to meet the difficulty of maintaining a supply of military lands in the future by forbidding further acquisitions of estates by the church. Basil II. returned to the policy of Romanus, but with much greater severity, resorting to confiscation of some of the immense private estates; and he endeavoured to keep down the aristocrats of Asia Minor by very heavy taxation. Through the recovery of the Balkan provinces he gained in Europe a certain political counterpoise to the influence of Asia Minor, which had been preponderant since the 7th century. Asia Minor meant the army, and opposition to its influence expressed itself in the 11th century in a fatal anti-military policy, which is largely responsible for the conquests of a new enemy, the Seljuk Turks, who now entered into the inheritance of the Caliphs (*see* CALIPHATE *ad fin.* and SELJUKS). Constantinople was haunted by the dread of a military usurpation. An attempt of the military hero George Maniaces (who had made a remarkable effort to recover Sicily) to wrest the crown from Constantine IX. had failed; and when Isaac Comnenus, who represented the military aristocrats of Asia Minor, ascended the

throne, he found himself soon compelled to abdicate, in face of the opposition. The reign of Constantine X., of the rival family of Ducas, marked the culmination of this antagonism. The senate was filled with men of the lower classes, and the military budget was ruthlessly cut down. This policy reduced the army and stopped the supply of officers, since there was no longer hope of a profitable career. The emperor thought to meet dangers from external enemies by diplomacy. The successes of the Seljuks (after the fall of the great Armenian fortress of Ani in 1064) at length awoke the Government from its dream of security. The general Romanus Diogenes was proclaimed emperor. He had to create an army and to train it; he did not spare himself, but it was too late. He was defeated and captured by Alp Arslan on the decisive field of Manzikert (1071). Released by the sultan, who honoured his bravery, he was deposed in favour of Michael Ducas, and falling into the hands of his enemies, was blinded. The east and centre of Asia Minor were thus lost; the Seljuk kingdom of Rûm was founded; Nicaea was captured by the Turks in 1080. The provinces which escaped the Seljuk occupation were thoroughly disorganized, a prey to foreign and native adventurers and usurpers (*see SELJUKS*).

Thus in the '70s of the 11th century the empire seemed through incompetence and frivolity to have been brought to the verge of dissolution. The disorder was terminated by the accession of the extraordinarily able statesman Alexius Comnenus (1081), who effected a reconciliation with the rival family of Ducas, established a strong Government and founded a dynasty. He had to deal with three great dangers—the Seljuks, the Petchenegs (*see above*), and in the west the Normans. The Normans had wrested from East Rome its possessions in south Italy (1041-71)—succeeding where German emperors had failed—and throughout the Comnenian period the empire was threatened by their projects of conquest beyond the Adriatic, projects which aimed at Constantinople itself.

Four great attempts against the empire were made by the Normans; they were unsuccessful, but they heralded the Western conquest of 1204. (1) Expedition of Robert Guiscard, 1081-85, repelled by Alexius with help of Venice; (2) Bohemond's expedition, 1105-07, foiled by the able strategy of Alexius; (3) the invasion of Greece by Roger of Sicily, 1147; Venice supported Manuel Comnenus, and the Normans were driven from Corfu, 1149; (4) the expedition of William II. of Sicily, 1185, who succeeded in capturing Thessalonica; the invaders were defeated at Demetritus, but they gained the islands of Cephalonia and Zacynthus.

The First Crusade.—The two most important events in the reign of Alexius were the prices which he paid for help against his enemies. (1) He was obliged (1084) to grant to Venice (*q.v.*) in return for her naval aid against the Normans, commercial privileges which practically made the empire commercially dependent on the republic. (2) He sought auxiliary forces in western Europe to help him against the Seljuks; the answer of the pope and Latin Christendom was the First Crusade—a succour very different from that which he desired. Through his tact and discretion, the State was safely steered through the dangers with which the disorderly hosts of barbarous allies menaced it, and the immediate results were salutary; large parts of Asia Minor, including Nicaea, were restored to the empire, which was thus greatly strengthened in the East while the Turks were weakened (*see CRUSADES*). But for this help Byzantium might not have recovered the transient strength and brilliance which it displayed under Manuel. In Asia Minor the crusaders kept the terms of their agreement to restore to the emperor what had belonged to him; but on capturing Antioch (1098) they permitted the Norman Bohemond to retain it, in flagrant violation of their oaths; for to Antioch if to any place the emperor had a right, as it had been his a few years before. This was in itself sufficient to cause a breach between Byzantium and the Latin kingdom of Jerusalem (founded 1099). But otherwise the new political situation created by the Crusade was dangerous, ultimately fatal, to the empire. For its lands and seas became a highway from western Europe to the Latin colonies in Syria; the Byzantine Government was forced to take precautions

to protect itself against the crusading expeditions which travelled to the Holy Land; and these precautions were regarded by the western Powers as a hindrance to the sacred objects of the crusades. The bitter religious antagonism between the Greek and Latin Christians increased the mutual distrust and the danger.

The history of the new relations between East and West dating from the First Crusade is closely connected with the history of the futile attempts at bringing about a reunion between the Greek and Latin Churches, which had severed communion in 1054. To heal the hurtful schism and bring the Greek Church again under the domination of Rome was a principal object of papal policy from Gregory VII. forward. The popes alternated between two methods for attaining this, as circumstances dictated: namely, a peaceful agreement—the policy of union; or an armed occupation of the empire by some western power (the Normans)—the policy of conquest. Their views varied according to the vicissitudes of their political situation and their struggles with the western emperors. The eastern emperors were also constantly preoccupied with the idea of reconciliation, constantly negotiating with a view to union; but they did not care about it for its own sake, but only for political advantages which it might bring, and their subjects were bitterly opposed to it. Manuel Comnenus during the first part of his reign was the close friend and ally of the western emperor Conrad III., but after Conrad's death he formed the ambitious plan of realizing in Europe a sovereignty like that of Justinian, and hoped to compass it in conjunction with Rome, the enemy of the Hohenstaufen. His forward policy carried war into Italy; he seized Ancona. But his strength was unequal to such designs. His Latin sympathies, no less than his financial extravagance, made him highly unpopular at home; and the national lack of sympathy with his Western policy was exhibited—after the revolution which overthrew his son Alexius and raised his cousin Andronicus I. to the throne—by the awful massacre of the Latin residents at Constantinople in 1182, for which the expedition of William of Sicily (*see above*) and the massacre of the people of Thessalonica were the revenge. The short reign of the wicked and brilliant Andronicus was in all respects a reaction, prudent, economical and popular. His fall was due to the aristocracy against whom his policy was directed, and the reign of Isaac Angelus undid his efforts and completed the ruin of the State. Oppressive taxation caused a revolt of the Bulgarian and Walachian population in the European provinces; the work of Zimisce and Basil was undone, and a new Bulgarian kingdom was founded by John Asen—a decisive blow to the Greek predominance which the Macedonian emperors seemed to have established.

Dismemberment of the Empire.—In the fatal year 1204 the perils with which the eastward expansion of western Christendom (the Crusades and the commercial predominance and ambitions of Venice) had long menaced the empire, culminated in its conquest and partition. It was due to a series of accidents that the cloud burst at this moment, but the conditions of such a catastrophe had long been present. Isaac Angelus was dethroned by his brother Alexius III., and his son escaped (1201) to the west, where arrangements were being made for a new crusade, which Venice undertook to transport to the Holy Land. The prince persuaded Philip of Swabia (who had married his sister) and Boniface of Montferrat to divert the expedition to Byzantium, in order to restore his father and himself to the throne, promising to furnish help to the Crusade and to reconcile the Greek Church with Rome; Venice agreed to the plan; but Pope Innocent III., the enemy of Philip, forbade it. Isaac and his son, Alexius IV., were restored without difficulty in 1203, and the crusading forces were prepared to proceed to Palestine, if Alexius had performed his promises. But the manner of this restoration, under Latin auspices, was intensely unpopular; he was not unwilling, but he was unable, to fulfil his pledges; and a few months later he was overthrown in favour of one who, if an upstart, was a patriot, Alexius V. Then the Crusaders, who were waiting encamped outside the city, resolved to carry out the design which the Normans had repeatedly attempted, and put an end to the Greek empire. The leaders of the Fourth Crusade must be acquitted of having

formed this plan deliberately before they started; it was not conceived before 1204. They first arranged how they would divide the empire amongst themselves (March); then they captured the city, which had to endure the worst barbarities of war. In partitioning the empire, which was now to become the spoil of the conquerors, the guiding mind was the Venetian leader, the blind dog, Henry Dandolo. He looked to the interests of Venice from the narrowest point of view, and in founding the new Latin empire, which was to replace the Greek, it was his aim that it should be feeble, so as to present no obstacles to Venetian policy. The Latin empire of Romania was a feudal State like the kingdom of Jerusalem; the emperor was suzerain of all the princes who established themselves on Greek territory; under his own immediate rule were Constantinople, southern Thrace, the Bithynian coast, and some islands in the Aegean. But he was hampered from the beginning by dependence on Venice, want of financial resources, and want of a fleet; the feudal princes, occupied with their separate interests, gave him little support in his conflict with Greeks and Bulgarians; at the end of ten years the worthless fabric began rapidly to decline, and the efforts of the popes, for whom it was the means of realizing Roman supremacy in the East, were unavailing to save it from the extinction to which it was doomed in its cradle.

Three Greek States emerged from the ruin of the Roman empire. A member of the Comnenian house had founded an independent State at Trebizond, and this empire survived till 1461, when it was conquered by the Ottomans. A relation of the Angeli maintained in Europe an independent Greek State known as the Despotate of Epirus. But the true representative of the imperial line was Theodore Lascaris, who collected the Byzantine aristocracy at Nicaea and was elected emperor in 1206. He and his successors advanced surely and rapidly against the Latin empire, both in Europe and Asia. It was a question whether Constantinople would fall to the Walachio-Bulgarians or to the Greeks. But an astute diplomat and general, the emperor Michael Palaeologus, captured it in 1261. His object was to recover all the lost territory from the Latins, but he was menaced by a great danger through Charles of Anjou, who had overthrown the rule of the Hohenstaufen in the two Sicilies, and determined to restore the Latin kingdom of Romania. To avert this peril, Michael negotiated with Pope Gregory X; he was ready to make every concession, and a formal union of the Churches was actually brought about at the Council of Lyons in 1274. The emperor had the utmost difficulty in carrying through this policy in face of clerical opposition; it aroused disgust and bitterness among his subjects; and it was undone by his successor. Meanwhile the pope had with difficulty bridled Charles of Anjou; but in Martin IV. he found a more pliable instrument, and in 1282 he made vast preparations for an expedition against the Greek empire. It was saved by the Sicilian Vespers (*see* SICILY), to be the prey of other Powers.

The Ottoman Turks.—The end of the 13th century saw the rise of the Ottoman power in Asia and the Servian in Europe. The empire was assisted by a band of Spanish mercenaries (the Catalan Grand Company; *see* GREECE: *History: Byzantine Period*) against the advance of the Ottoman Turks in Asia Minor; they distinguished themselves by saving Philadelphia (1304). In 1326 Brusa (Prusa) became the Ottoman capital, while on the other side the Servians (crushing the Bulgarians in 1330) were gradually closing in on Byzantium. Under Stephen Dušan (1331–55) Servia attained the height of her power. The enemies were strengthened by the domestic struggles within the empire, first between Andronicus II. and his son, then between John VI. and the usurper Cantacuzenus. But before the fate of Byzantium was settled the two enemies on its flanks came face to face. In 1389 the Servian power was crushed on the field of Kosovo by the Ottomans (who had crossed the Hellespont in 1360 and taken Philippopolis in 1363). Sultan Bayezid I. won Philadelphia, the last Asiatic possession of the empire, and conquered Trnovo, the Bulgarian capital, in 1393. Constantinople was now surrounded. The Ottoman power was momentarily eclipsed, and the career of conquest checked, by the Mongol invasion of Timur and the great defeat which it sustained in the battle of Angora (1402). Moham-

med I. found it necessary to ally himself with the emperor Manuel. But the pause was brief. Murad II. took Adrianople, and tried (1422) to take Constantinople.

It was small compensation that during this time the Palaeologi had been successful against the Franks in Greece. The situation was desperate. The Turks were in possession of the Balkan peninsula, threatening Hungary; there was no chance of rescue, except from western Europe. John VI. and Manuel had both visited the West in search of help. The jeopardy of the empire was the opportunity of Rome, and the union of the Churches became the pressing question. It was taken up earnestly by Pope Eugenius IV., and the result was the Decree of Union at the Council of Florence in 1439. The emperor and the higher clergy were really in earnest, but the people and the monks did not accept it, and the last agony of Byzantium was marked by ecclesiastical quarrels. Eugenius IV. preached a crusade for the rescue of the empire, and in 1443 an army of Hungarians and Poles, led by the Hungarian king, won a victory over Murad, which was more than avenged in the next year on the memorable field of Varna. The end came nine years later under Murad's successor, Mohammed II. An army of about 150,000 blockaded the city by land and sea, and Mohammed began the siege on the 7th of April. The emperor Constantine XI., Palaeologus, on whom the task of the forlorn defence devolved (and whose position was all the more difficult because he was alienated from his subjects, having embraced the Latin rite), can have had little more than 8,000 men at his disposal; he received no help from the Western powers; but an experienced Genoese soldier of fortune, John Justiniani, arrived with two vessels and 400 cuirassiers and aided the emperor with his courage and advice. The resident foreigners, both Venetians and Genoese, loyally shared in the labours of the defence. The final storm of the land walls took place on the night of the 29th of May. All looked to Justiniani for salvation, and when he, severely wounded, retired from the wall to have his wound looked to, a panic ensued. The enemy seized the moment, and the Janissaries in a final charge rushed the stockade which had been constructed to replace a portion of the wall destroyed by the Turkish cannon. This decided the fate of the city. Constantine fell fighting heroically. Soon after sunrise (May 30) the Mohammedan army entered Constantinople (Stambul = 'ἡ πῶλις, "the city"), which was in their eyes the capital of Christendom.

The ultimate responsibility for this disaster is generally imputed to the political adventurers who dismembered the empire in 1204. It may indeed be said that at that time the Byzantine State seemed already stricken with paralysis and verging on dissolution, and it was menaced by the re-arisen power of Bulgaria. But more than once before (in the 7th century and in the 11th) it had recovered its strength when it was weak and in dire peril; and, considering what the emperors of Nicaea and Michael VIII. accomplished, it seems probable that, if there had been no Fourth Crusade, it might have so revived and consolidated its forces in the course of the 13th century, as to be able to cope successfully with the first advances of the Ottomans. The true statement is that the Fourth Crusade was only an incident (not in itself decisive) in a world-movement which doomed the Eastern empire to extinction—namely, the eastward movement of western Europe which began in the 11th century with the rise of the Normans and the First Crusade. Henceforward the empire was a middle State, pressed between expanding forces on the east and on the west, and its ultimate disappearance was inevitable.

CHURCH AND STATE

In making the State Christian, Constantine made the Church a State institution, and therefore under imperial control. Caesaropapism was the logical consequence. The *sacerdotium* was united with the *imperium* in the person of the monarch as in the pagan State. The Church acquiesced, and yet did not acquiesce, in this theory. When a heretical emperor sought to impose his views, champions of ecclesiastical freedom never failed to come forward. At the very beginning Athanasius fought for the independence of the Church against the emperor Constantius. But the political principle which Constantine had taken for granted, and which was

an indispensable condition of his adoption of Christianity, was fully recognized under Theodosius I., and, notwithstanding protests from time to time, was permanent. It is significant that Constantinople, which had become a second Rome politically, with its senate and capitol, became then a second Rome ecclesiastically, and that the elevation of the see of Constantinople to patriarchal rank next to the Roman see was due to Theodosius (381), who gave a permanent form to the dualism of the empire. The patriarch became a State minister for religion. The character of the Church as a State institution is expressed above all in the synods. The general councils are not only summoned by the emperor, but are presided over by him or by his lay deputies. The order of the proceedings is modelled on that of the senate. The emperor or his representative not only keeps order but conducts the deliberations and intervenes in the theological debates. It has been erroneously thought that at the Council of Chalcedon (451) the legate of Pope Leo presided; but the acts of that assembly teach us otherwise; the privilege which the Roman legates possessed was that of voting first (the right of the *princeps senatus*). The first general council at which a churchman presided was the seventh (at Nicaea, 787), at which the emperor (or empress) deputed, not a layman, but the patriarch Tarasius to preside. The resolutions of these ecclesiastical State-councils did not become the law of the empire till they were confirmed by imperial edicts.

The emperors, in their capacity as heads of the Church, did not confine themselves to controlling it by controlling the councils. They soon began to issue edicts dealing with theology, by virtue of their own authority. It has been said that the council of Chalcedon closed an epoch of "parliamentary constitutionalism"; a general council was not summoned again for more than 100 years, though the empire during that period was seething with religious disunion and unrest. The usurper Basiliscus in his short reign set an example which his successors were not slow to follow. He issued an edict quashing the decision of Chalcedon. Zeno's *Henotikon* issued a few years later was the second and more famous example of a method which Justinian largely used, and of which the *Echthesis* of Heraclius, the *Type* of Constans II. and the iconoclastic edicts of Leo III. are well-known instances. It was a question of political expediency (determined by the circumstances, the intensity and nature of the opposition, etc.) whether an emperor supported his policy or not by an ecclesiastical council.

The emperor was always able to control the election of the patriarch, and through him he directed the Church. Sometimes emperor and patriarch collided; but in general the patriarchs were docile instruments, and when they were refractory they could be deposed. There were several means of resistance open to a patriarch, though he rarely availed himself of them. His participation in the ceremony of coronation was indispensable, and he could refuse to crown a new emperor except on certain conditions, and thus dictate a policy (instances in 812, Michael I.; 969, John Zimisces). There was the power of excommunication (Leo VI. was excommunicated on account of his fourth marriage). Another means of resistance for the Church was to invoke the support of the bishop of Rome, who embodied the principle of ecclesiastical independence and whose see admittedly enjoyed precedence and primacy over all the sees in Christendom. Up to the end of the 8th century he was a subject of the emperor, and some emperors exerted their ecclesiastical control over Rome by drastic measures (Justinian and Constans II.). But after the conquest of Italy by Charles the Great, the pope was outside the Byzantine domination; after the coronation of Charles in 800 he was associated with a rival empire; and when ecclesiastical controversies arose in the East, the party in opposition was always ready to appeal to him as the highest authority in Christendom. Under the iconoclastic emperors the image-worshippers looked to him as the guardian of orthodoxy.

Theological Controversies.—As to the ecclesiastical controversies which form a leading feature of Byzantine history, their political significance alone concerns us. After the determination of the Arian controversy in 381 new questions (as to the union of the divine and human elements in the person of Christ: one or two natures?) arose, and it may seem surprising that such points

of abstruse theology should have awakened universal interest and led to serious consequences. The secret was that they masked national feelings; hence their political importance and the attention which the Government was forced to bestow on them. The reviving sense of nationality (anti-Greek) in Syria and in Egypt found expression in the 5th century in passionate monophysitism (the doctrine of one nature): theology was the only sphere in which such feelings could be uttered. The alienation and dissension which thus began had fatal consequences, smoothing the way for the Saracen conquests of those lands; the inhabitants were not unwilling to be severed politically from the empire. This ultimate danger was at first hardly visible. What immediately troubled the emperors in the first half of the 5th century was the preponderant position which the see of Alexandria occupied, threatening the higher authority of Constantinople. The Council of Chalcedon, called by Marcian, an able statesman, was as much for the purpose of ending the domination of Alexandria as of settling the theological question. The former object was effected, but the theological decision of the council was fatal; it only sealed and promoted the disunion. The recalcitrant spirit of Syria and Egypt forced Zeno, 30 years later, to issue his *Henotikon*, affirming the decisions of previous councils but pointedly ignoring Chalcedon. This statesman-like document secured peace in the East for a generation. Rome refused to accept the *Henotikon*, and when Justinian resolved to restore imperial supremacy in the Western kingdoms, conciliation with Rome became a matter of political importance. For the sake of this project, the unity of the East was sacrificed. The doctrine of Chalcedon was reasserted, the *Henotikon* set aside; New Rome and Old Rome were again hand in hand. This meant the final alienation of Egypt and Syria. The national instinct which had been alive in the 5th century grew into strong national sentiment in the 6th. One of the chief anxieties of Justinian's long and busy reign was to repair the mischief. Deeply interested himself in matters of dogma, and prepared to assert to its fullest extent his authority as head of the church, he has been called "the passionate theologian on the throne"; but in his chief ecclesiastical measures political considerations were predominant. His wife Theodora was a monophysite, and he permitted her to extend her protection to the heretics. He sought new formulas for the purpose of reconciliation, but nothing short of repudiation of the Chalcedon acts would have been enough. The last great efforts for union were made when the Saracens invaded and conquered the dissident provinces. A new formula of union was discovered (One Will and One Energy). This doctrine of monothelism would never have been heard of but for political exigencies. The Egyptians and Syrians would perhaps have accepted this compromise; but it was repudiated by the fanatical adherents of Chalcedon. Heraclius sought to impose the doctrine by an edict (*Echthesis*, 638), but the storm, especially in Italy and Africa, was so great that ten years later an edict known as the *Type* was issued by Constans forbidding all dispute about the number of wills and energies. Constans was a strong ruler, and maintained the *Type* in spite of orthodox opposition throughout his reign. But the expediency of this policy passed when the Saracens were inexorably settled in their conquests, and in his successor's reign it was more worth while to effect a reconciliation with Rome and the West. This was the cause of the 6th Ecumenical Council which condemned monothelism (680-681).

Image-worship.—In the Hellenic parts of the empire devotion to orthodoxy served as a chrysalis for the national sentiment which was to burst its shell in the 10th century. For the Greeks Christianity had been in a certain way continuous with paganism. It might be said that the old deities and heroes who had protected their cities were still their guardians, under the new form of saints (sometimes imaginary) and archangels, and performed for them the same kind of miracles. Pagan idolatry was replaced by Christian image-worship, which by the Christians of many parts of Asia Minor, as well as by the Mohammedans, was regarded as simply polytheism. Thus in the great iconoclastic controversy, which distracted the empire for nearly 120 years, was involved, as in the monophysitic, the antagonism between different racial elements and geographical sections. Leo III., whose services as a

great deliverer and reformer were obscured in the memory of posterity by the ill-fame which he won as an iconoclast, was a native of Commagene. His first edict against the veneration of pictures evoked riots in the capital and a revolt in Greece. The opposition was everywhere voiced by the monks, and it is not to be overlooked that for many monks the painting of sacred pictures was their means of existence. Leo's son Constantine V. pursued the same policy with greater rigor, meeting the monastic resistance by systematic persecution, and in his reign a general council condemned image-worship (753). Iconoclasm was supported by the army, *i.e.*, Asia Minor, and a considerable portion of the episcopate, but it was not destined to triumph. When the Athenian Irene, wife of Leo IV., came to power after her husband's death, she sent for her son, Constantine VI., she secured the restoration of the worship of icons. The Iconoclastic Council was reversed by the 7th Ecumenical Council of 787. The iconoclastic party, however, was not yet defeated, and (after the neutral reign of Nicephorus I.) came again to the helm in the reigns of the Armenian Leo V. and the first two Phrygian emperors, Michael II. and Theophilus. But the empire was weary of the struggle, and on the death of Theophilus, who had been rigorous in enforcing his policy, icon-worship was finally restored by his widow Theodora (843), and the question was never reopened. This was a triumph for the Greek element in the empire; the "Sunday of orthodoxy" on which iconoclasm was formally condemned is still a great day in the Greek Church.

The ablest champions who wielded their pens for the cause of icons, defending by theological arguments practices which really had their roots in polytheism, were in the early stage John of Damascus and in the later Theodore (abbot of the monastery of Studium at Constantinople). The writings of the iconoclasts were destroyed by the triumphant party, so that we know their case only from the works of their antagonists.

Schism Between the Greek and Latin Churches. In this struggle the Greeks and Latins were of one mind; the image-worshippers had the support of the Roman see. When the pope resisted him, Leo III. confiscated the papal estates in Sicily and Calabria; and the diocese of Illyricum was withdrawn from the control of Rome and submitted to the patriarch of Constantinople. But when iconoclasm was defeated, there was no question of restoring Illyricum, nor could there be, for political reasons; since the iconoclastic schism had, with other causes, led to the detachment of the papacy from the empire and its association with the Frankish power. By the foundation of the rival Roman empire in 800 the pope had definitely become a subject of another State. No sooner had the iconoclastic struggle terminated than differences and disputes arose between the Greek and Latin Churches which finally led to an abiding schism, and helped to foster the national self-consciousness of the Greeks. A strife over the patriarchal chair between Ignatius (deposed by Michael III. and supported by Rome) and Photius, the learned statesman who succeeded him, strained the relations with Rome, but a graver cause of discord was the papal attempt to win Bulgaria, whose emperor Boris had been baptized under the guidance of Michael III. The pope's efforts to bring about the union of the New Roman Empire and the Church of Rome failed, and the schism became permanent. The Roman pontiff refused to accept the Council of Chalcedon as authoritative, and the Greek Church rejected the pope's claim of universal jurisdiction. The Greek Church was united with the Russian Church in 1494, and the Greek Church and the Russian Church have remained united ever since. The Greek Church has since been united with the Russian Church in 1494, and the Greek Church and the Russian Church have remained united ever since.

aggressive designs of Western princes. They were doomed to futility because they were not seriously meant, and the Greek population was entirely out of sympathy with these political machinations of their emperors. The Union of Lyons (1274) was soon repudiated, and the last attempt, the Union of Florence in 1439, was equally hollow (though it permanently secured the union of the Rumanians and of the Ruthenians). Part of the historical significance of the relations between the Greek and Latin Churches lies in the fact that they illustrated and promoted by way of challenge the persistence of Greek national self-consciousness.

The emperors legislated against paganism and against heresy, not merely under ecclesiastical pressure, but because they thought religious uniformity politically desirable. Theodosius the Great, a Spaniard, with no sympathy for Hellenic culture, set himself the task of systematically eradicating pagan institutions and customs. Though his persecution accomplished much, paganism was far from being extinct either in the East or in the West in the 5th century. Not only did heathen cults survive in many remote districts, but the old gods had many worshippers among the higher classes at Rome, Constantinople, Antioch, Alexandria and Athens. The most distinguished Greek literati of that period were non-Christian. Justinian, who united theological enthusiasm with belief in the ideal of uniformity and, like Theodosius, was out of sympathy with Hellenism ("Hellene" now came to mean "pagan"), persecuted polytheism more earnestly and severely than his predecessors. His measures created a panic among the higher classes at Byzantium, of whom many, as he suspected, were addicted to the ancient religion. He instituted a regular inquisition, exacted oaths of orthodoxy from all officials and teachers, and closed the philosophical schools of Athens. Missionaries (and it is remarkable that he employed monophysite heretics) were sent to abolish the old heathen worship which survived in many parts of Asia Minor where Christianity had hardly penetrated. By the end of the 6th century formal paganism had practically disappeared.

In Asia Minor, especially in the east, there were many dissident communities which asserted independence of the Church of Constantinople and of all ecclesiastical traditions, founding their doctrines directly on the Bible. Most important of these heretics were the Paulicians (*q.v.*), a dualistic sect whom the Church regarded as Manichaeans.

THE MACHINERY OF GOVERNMENT

The Autocrats and Its Constitutional Forms.—With Diocletian the Principate of Augustus had become undisputedly an absolute monarchy, and this constitution prevailed to the end. There is virtually no constitutional history in the proper sense of the term in the later Roman empire, for there was neither evolution nor revolution. The monarchical system remained in all its essential points unchanged, and presents a remarkable example of an autocracy of immense duration which perfectly satisfied the ideas of its subjects. No attempt was made to alter it—to introduce, for instance, a limited monarchy or a republican Government; all revolts and conspiracies were aimed at the policies of particular autocrats, not at autocracy itself; generally they only represented sectional antagonisms and personal ambitions. The emperors inherited a deeply rooted instinct of legality as a tradition from Old Rome; and this respect for law which marked their acts, along with the generally good administration of justice, was a palladium of the monarchy. They were supreme in legislation, as well as in the administrative and judicial spheres; but they were on the whole moderate in wielding legislation as an instrument of policy.

There were, however, recognized constitutional principles which it would have been impossible for the emperor to override.

(r) The elective principle, inherited from the republic, was never changed. A new emperor had to be elected by the senate and acclaimed by the people. The succession never became automatic. But even Augustus had indirectly introduced the dynastic principle. Theodosius the Great, by causing his two sons, Arcadius and Honorius, to be elected Augusti in their infancy, practically elevated the dynastic idea into a constitutional principle: hence-

forward it was regarded as in the regular course that the son born to a reigning sovereign should in his infancy be elected Augustus. Thus the election, though always an indispensable form, was only a reality when a dynasty came to an end.

(2) When the position of Christianity was assured by the failure of Julian's reaction, it was evident that profession of that religion would henceforward be a necessary qualification for election to the throne. This was formally and constitutionally recognized when the coronation of the emperor by the patriarch was introduced in 457, or perhaps in 450.

(3) The sovereignty of the emperor was personal and *not territorial*. In this respect it always retained the character which it had inherited as the offspring of a Roman magistracy. Hence no Roman territory could be granted by the emperor to another power. For instance, the Western emperor Conrad III. could promise to hand over Italy to Manuel Comnenus as the dowry of his wife, but it would have been constitutionally illegal for Manuel to have made such a promise to any foreign prince; an Eastern emperor had no right to dispose of the territory of the State. Tendencies towards a territorial conception begin indeed to appear (partly under Western influence) in the time of the Palaeologi, especially in the custom of bestowing appanages on imperial princes.

(4) While the senate of Rome generally lost its importance and at last became a mere municipal body, the new senate of Constantinople preserved its position as an organ of the State till the fall of Constantinople. For the imperial elections it was constitutionally indispensable, and it was able sometimes to play a decisive part when the throne was vacant—its only opportunity for independent action. The abolition, under Diocletian's system, of the senatorial provinces deprived the senate of the chief administrative function which it exercised under the Principate; it had no legislative powers; and it lost most of its judicial functions. It was, however, still a judicial court; it tried, for instance, political crimes. In composition it differed from the senate of the Principate. The senators in the 4th century were chiefly functionaries in the public service, divided into the three ascending ranks of *clarissimi*, *spectabiles*, *illustres*. The majority of the members of the senatorial order lived in the provinces, forming a provincial aristocracy, and did not sit in the senate. Then the two lower ranks ceased to have a right to sit in the senate, which was confined to the *illustres* and men of higher rank (patricians). The senatorial order must therefore be distinguished from the senate in a narrower sense; the latter finally consisted mainly of high ministers of State and the chief officials of the palace. It would be a grave mistake to underrate the importance of this body, through an irrelevant contrast with the senate of the republic or even of the Principate. Its composition ensured to it great influence as a consultative assembly; and its political weight was increased by the fact that the inner council of imperial advisers was practically a committee of the senate. The importance of the senate is illustrated by the fact that in the 11th century Constantine X., in order to carry out a revolutionary, anti-military policy, found it necessary to alter the composition of the senate by introducing a number of new men from the lower classes.

(5) The memory of the power which had once belonged to the *populus Romanus* lingered in the part which the inhabitants of New Rome, and their representatives, played in acclaiming newly elected emperors, and in such ceremonies as coronations. In the 6th century the factions ("demes") of the circus, Blues and Greens, appear as political parties, distract the city by their quarrels, and break out in serious riots. On one occasion they shook the throne ("Nika" revolt, 532). The emperors finally quelled this element of disturbance by giving the factions a new organization, under "demarchs" and "democrats," and assigning them a definite quasi-political *locus standi* in the public ceremonies in the palace and the capital. The duty of providing *panem et circenses* was inherited from Old Rome; but the free distribution of bread cannot be traced beyond the 6th century (had the loss of the Egyptian granary to do with its cessation?), while the spectacles of the hippodrome lasted till the end. Outside

the capital the people took little interest in politics, except when theology was concerned; and it may be said generally that it was mainly in the ecclesiastical sphere that public opinion among the masses, voiced by the clergy and monks, was an influence which made itself felt.

The court ceremonial of Constantinople, which forms such a marked contrast to the ostentatiously simple establishments of Augustus and the Antonines, had in its origin a certain constitutional significance. It was introduced by Aurelian and Diocletian, not, we must suppose, from any personal love of display, but rather to dissociate the emperor from the army, at a time when the State had been shaken to its foundations by the predominance of the military element and the dependence of the emperor on the soldiers. It was the object of Diocletian to make him independent of all, with no more particular relation to the army than to any other element in the State; the royal court and the inaccessibility of the ruler were calculated to promote this object. The etiquette and ceremonies were greatly elaborated by Justinian, and were diligently maintained and developed. The public functions, which included processions through the streets to various sanctuaries of the city on the great feast-days of the Church, supplied entertainment of which the populace never wearied; and it did not escape the wit of the rulers that the splendid functions and solemn etiquette of the court were an effective means of impressing the imagination of foreigners, who constantly resorted to Constantinople from neighbouring kingdoms and dependencies, with the majesty and power of the Basileus.

The imperial dignity was collegial. There could be two or more emperors (*imperatores*, *βασιλεῖς*) at the same time; edicts were issued, public acts performed, in their joint names. Through the period of dualism, in the 4th and 5th centuries, when the administration of the Eastern provinces was generally separate from that of the Western, the imperial authority was also collegial. But after this period the system of divided authority came to an end and was never renewed. There was frequently more than one emperor, not only in the case of a father and his sons, or of two brothers, but also in the case of a minority, when a regent is elected emperor (Romanus I.; cf. Nicephorus II. and John Zimisces). But one colleague always exercised the sole authority, was the real monarch, the "great" or the "first" Basileus; the other or others were only sleeping partners. Under the Comneni a new nomenclature was introduced; a brother, e.g., who before could have become the formal colleague of the ruler, received the title of *Sebastocrator* (Sebastos was the Greek equivalent of Augustus).

Legislation.—The history of the legislation of the Eastern empire is distinguished by three epochs associated with the names of (1) Justinian, (2) Leo III., (3) Basil I. and Leo VI.

For (1) the Justinianean legislation, see JUSTINIAN I.

(2) Justinian's reign was followed by a period in which juristic studies decayed. The 7th century, in which social order was profoundly disturbed, is a blank in legal history, and it would seem that the law of Justinian, though it had been rendered into Greek, almost ceased to be studied or understood. Practice at least was modified by principles in accord with the public opinion of Christian society and influenced by ecclesiastical canons. In a synod held at Constantinople in the reign of Justinian II. numerous rules were enacted, differing from the existing laws and based on ecclesiastical doctrine and Mosaic principles, and these were sanctioned as laws of the realm by the emperor. Thus Church influence and the decline of Roman tradition, in a State which had become predominantly Greek, determined the character of the ensuing legislative epoch under the auspices of Leo III., whose law book (A.D. 740), written in Greek, marks a new era and reflects the changed ideas of the community. Entitled a "Brief Selection of Laws" and generally known as the *Ecloga*, it may be described as a Christian law book. In regard to the *patria potestas* increased facilities are given for emancipation from paternal control when the son comes to years of discretion, and the paternal is to a certain extent replaced by a *parental* control over minors. The law of guardianship is considerably modified. The laws of marriage are transformed under the influence of the Christian

conception of matrimony; the institution of *concubinatus* is abolished. Impediments to marriage on account of consanguinity and of spiritual relationship are multiplied. While Justinian regarded marriage as a contract, and therefore, like any other contract, dissoluble at the pleasure of the parties, Leo III accepted the Church view that it was an indissoluble bond. Ecclesiastical influence is written large in the criminal law, of which a prominent feature is the substitution of mutilation of various kinds for the capital penalty. Death is retained for some crimes, such as murder and high treason; other offences were punished by amputation (of hand, nose, etc.). This system (justified by the passage in the New Testament, "If thine eye offend thee," etc.), though to modern notions barbaric, seemed a step in the direction of leniency; and it may be observed that the tendency to avoid capital punishment increased, and we are told that in the reign of John Commenus it was never inflicted. (The same spirit, it may be noted, is apparent in the usual, though by no means invariable, practice of Byzantine emperors to render dethroned rivals or members of a deposed dynasty innocuous by depriving them of eyesight or forcing them to take monastic orders, instead of putting them to death.) The Church, which had its own system of penalties, exercised a great influence on the actual operation of criminal law, especially through the privilege of asylum (recognized by Justinian, but with many reserves and restrictions), which was granted to Christian churches and is admitted without exceptions in the *Ecdloga*.

(3) The last period of legislative activity under Basil I. and Leo VI. represents a reaction, in a certain measure, against the *Ecdloga* and a return to Justinian. The *Ecdloga* had met practical needs, but the Isaurian and Phrygian emperors had done nothing to revive legal study. To do so was the aim of Basil, and the revival could only be based on Justinian law books or the Greek representatives. These books were now treated somewhat as Justinian and his lawyers had treated their own predecessors. A handbook of extracts from the Institutes, Digest and Code was issued in 879 (ὁ πρῶτος νόμος, "the law as it is"), to fulfil somewhat the same function as the Institutes. Then a collection of all the laws of the empire was prepared by means of two commissions, and completed under Leo VI. It was entitled the *Basilika*. In many points (in civil, but not in criminal, law) the principles of the *Ecdloga* are set aside in favour of the older jurisprudence. Thus the Justinian ordinances on the subject of divorce were revived, and there remained henceforward a contradiction between the civil and the canon law.

After this there was no legislation on a grand scale; but there was a great revival of legal study under Constantine IX., who founded a new law-school, and there were many learned specialists who wrote important commentaries, such as John Xiphilin (11th century), Theodore Balsamon (12th century), Harmenopoulos (14th century). The civil code of Moldavia (published 1816-17) is a codification of Byzantine law; and modern Greece, although in framing its code it took the Napoleonic for its model, professes theoretically to base its civil law on the edicts of the emperors as contained in the *Hexabiblos* of Harmenopoulos.

Administration.—Three principles underlay the administrative reform of Diocletian: the separation of civil from military functions; the formation of small provincial units; and the scalar structure which depended on the interposition of the vicar of a diocese and the praetorian prefect between the provincial governor and the emperor. This system lasted unchanged for three and a half centuries. The few unimportant alterations that were made were in harmony with its spirit, until the reign of Justinian, who introduced certain reforms that pointed in a new direction. We find him combining some of the small provinces into large units, undermining the scalar system by doing away with some of the dioceses and vicars, and placing in some cases military and civil authority in the same hands. The chief aim of Diocletian in his general reform had been to secure central control over the provincial Governments; the object of Justinian in these particular reforms was to remedy corruption and oppression. These changes, some of which were soon cancelled, would hardly in themselves have led to a radical change; but they pre-

pared the way for an administrative revolution, brought about by stress of external necessities. In the 7th century all the energies of the empire, girt about by active enemies, were centred on war and defence; everything had to give way to military exigencies; and a new system was gradually introduced which led ultimately to the abolition of the old. The change began in Italy and Africa, at the end of the 6th century, where operations against the Lombards and the Berbers were impeded by the friction between the two co-ordinate military and civil authorities (masters of soldiers, and praetorian prefects). The military governors were made supreme with the title of *exarchs*, "viceroys"; the civil authority was subordinated to them in case of collision, otherwise remaining unaltered. The change is an index of the dangerous crisis through which these provinces were passing. In the East similar circumstances led to similar results. The Saracen danger hanging imminent over Asia Minor imposed a policy of the same kind. And so before the end of the 7th century we find the empire divided into six great military provinces, three in Europe and three in Asia: (1) Exarchate of Africa, (2) Exarchate of Italy, (3) Strategia of Thrace, (4) County of Opsikion (= *obsequium*), including Bithynia, Honorias, Paphlagonia, parts of Hellespontus and Phrygia, (5) Strategia of the *Anatolikos*, most of west and central Asia Minor, (6) Strategia of the *Armeniakos*, eastern Asia Minor. In addition to these there was a naval circumscription, (7) the Strategia of the *Karabisianoi* (from *κάρβος*, a vessel), including the southern coastland of Asia Minor, and the Aegean (see below under *Navy*).

The lands of the old prefecture of Illyricum were not included in the system, because this part of the empire was then regarded as a lost position. On the contrary, here military powers were committed to the prefect of Illyricum, whose actual sphere extended little beyond Thessalonica, which was surrounded by Slavonic tribes.

The Eastern changes, perhaps initiated by Heraclius, but probably due mainly to Constans II., did not interfere with the civil administration, except in so far as his heads were subordinated to the military commanders. But Leo III., who as a great administrative reformer ranks with Augustus and Diocletian, did away with the old system altogether. (1) Reversing Diocletian's principle, he combined military and civil powers in the same hands. The *strategos* or military commander became also a civil governor; his higher officers (turmarshs) were likewise civil functionaries. (2) The scalar principle disappeared, including both the vicars and the praetorian prefect of the East (some of whose functions were merged in those of the prefect of the city); no authority interposed between the *strategoi* and the emperor. (3) The new provinces, which were called *themas* (the name marks their military origin: *thēma*=corps), resembled in size the provinces of Augustus, each including several of the Diocletian divisions. This third and last provincial reform has, like its predecessors, its own history. The list of *themas* in the 11th century is very different from that of the 8th. The changes were in one direction—the reduction of large provinces by cutting off parts to form smaller *themas*, a repetition of the process which reduced the provinces of Augustus. Hence the *themas* came to vary greatly in size and importance. Leo himself began the process by breaking up the Anatolic command into two *themas* (Anatolic and Thracian). The principle of splitting up was carried out systematically by Leo VI. (who was also responsible for a new ecclesiastical division of the empire).

Imperial Officials.—In the central administration, the general principles seem to have remained unchanged; the heads of the great administrative bureaux in Constantinople retain the *palatine* character which belonged to most of them from the beginning. But there were many changes in these offices, in their nomenclature and the delimitation of their functions. There are great differences between the administrative corps in the 5th, in the 10th and in the 15th centuries. We can hardly be wrong in conjecturing that, along with his provincial reform, Leo III. made a rearrangement of the central bureaux; the abolition of the praetorian prefecture of the East entailed, in itself, modifications. But minor changes were continually being made, and we may note the fol-

lowing tendencies: (1) Increase in the number of ministers directly responsible to the emperor, (a) subordinate offices in the bureaux being raised to the rank of independent ministries; (b) new offices being created and old ones becoming merely titular. (2) Changes in nomenclature; substitution of Greek for Latin titles. (3) Changes in the relative importance and rank of the high officials, both civil and military.

The prefect of the city (*επαρχος*) controlled the police organization and administration of justice in the capital; he was vice-president of the imperial court of justice, and, when the office of prefect of the East was abolished, he inherited the functions of that dignity as judge of appeals from the provinces. But the *praefectus vigilum*, commander of the city guards, who was subordinate to him, became an independent officer, entitled drummajor of the watch, and in the 17th century superseded him as vice-president of the imperial court. We are told that in the last years of the empire the prefect of the city had no functions at all; but his office survives in the *Shehr-imaneti*, "city prefecture," of the Ottomans, in whose organization there are many traces of Byzantine influence.

Instead of the quaestor of the sacred palace, whose duty was to draft the imperial laws and rescripts, we find in the 9th century a quaestor who possesses certain judicial and police functions and is far lower in the hierarchy of rank. It has been supposed that the later quaestor really inherited the duties of another officer, the *quaestor*, who was instituted by Justinian. In the latest period the quaestor, if he still existed as a name, had no functions.

The master of offices, who supervised the bureaux in the palace and was master of court ceremonies, also performed many functions of a minister of foreign affairs, was head of the imperial post (*cursus*), and of the corps of *agentes in rebus* or imperial messengers. This ministry disappeared, probably in the 8th century, but the title was retained as a dignity at all events till the end of the 9th. The most important functions, pertaining to foreign affairs, were henceforward performed by the logothete of the post (*λογόθετης τοῦ δόξου*). In the 12th century this minister was virtually the chancellor of the empire; his title was changed to that of great logothete by Andronicus II.

The two financial ministers, *comes sacrarum largitionum* and *comes rei privatae*, continued to the end under the titles *λογόθετης τοῦ γενικοῦ* (general logothete) and *ὁ ἐπὶ τοῦ βασιλικοῦ* (Anastasius added a third, the count of the sacred patrimony, but he was afterwards suppressed). But in the 9th century we find both these ministers inferior in rank to the *secularis*, or private purse-keeper of the emperor. Besides these there was a fourth important financial department, that of the military treasury, under a logothete.

The employment of eunuchs as high ministers of State was a feature of the Byzantine empire from the end of the 4th century. It is laid down as a principle (A.D. 900) that all offices are open to them, except the prefecture of the city, the quaestorship, and the military posts which were held by "domestics." There were then eight high posts which only be held by eunuchs, of which the chief were the *parakoimōmenos* and the *protovestiarios* (master of the wardrobe).

An emperor who had not the brains or energy to direct the affairs of the State himself, necessarily committed the task of guiding the helm to some particular minister or court dignitary who had gained his confidence. Such a position of power was outside the constitution, and was not associated with any particular office; it might be held by an ecclesiastic or a eunuch; it had been held by the eunuchs Eutropius and Chrysaphius in the reigns of Arcadius and Theodosius II. respectively. In later times, such a first minister came to be denoted by a technical term, *ὁ παραβουβαρρεύων*. This was the position, for instance, of Stylianus, the father-in-law of Leo VI. Most of the emperors between Basil II. and Alexius Comnenus were under the influence of such ministers.

The orders of rank (which must be distinguished from titles of office) were considerably increased in later times. In the 4th and 7th centuries there were the three great classes of the *illustres*, *spectabiles* and *clarissimi*; and above the *illustres* a small, higher

class of patricians. In the 9th century we find an entirely different system; the number of classes being largely augmented, and the nomenclature different. Instead of epithets, like *illustres*, the names are titles which had designated offices; "patrician" alone survives. The highest rank is now (1) the *magistroi*; then come the patricians in two classes: (2) proconsular patricians, (3) respectable patricians; below these (4) *protospatharioi*, (5) *dishypatoi* (= *bis consules*), (6) *spatharokandidatoi*, (7) *spatharioi*, and other lower ranks. Particular ranks do not seem now to have been inalienably attached to particular offices. The *strategos* of the Anatolic theme, e.g., might be a patrician or only a protospathar. Whoever was promoted to one of these ranks received its insignia from the emperor's hand, and had to pay fixed fees to various officials, especially to the palace eunuchs.

In the provinces ordinary justice was administered by judges (*κυραί*) who were distinct from the governors of the themes, and inherited their functions from the old provincial governors of Diocletian's system. In Constantinople higher and lower courts of justice sat regularly and frequently. The higher tribunals were those of the prefect and the quaestor, before whom different kinds of cases came. Appeals reached the emperor through the bureau of petitions (*τὸν δευόων*); he might deal with the case immediately; or might refer it to the imperial court of appeal, of which he was president; or else to the special court of the Twelve Divine Judges (*θείαι δώκαρραι*), which was instituted by Justinian.

Fiscal System.—While the administration of justice was one of the best features of the Eastern empire, its fiscal system, likewise inherited from the early empire, was one of its worst. If the Government had been acquainted with the principles of public economy, which have not been studied till comparatively recent times, a larger revenue might have been raised without injuring the prosperity of the inhabitants. Taxes were injudiciously imposed and oppressively collected. The commerce of the empire was one of its great sources of strength, but the Government looked on the merchants as a class from which the utmost should be extorted. The chief source of revenue was the land. The main burdens which fell upon the landed proprietors throughout the whole period were the land tax proper and the *amonā*. The land tax (*capitatio terrena*) the old *tributum* of the imperial, *stipendium* of the senatorial provinces) was based, not on the yearly produce, but on the capital of the proprietor, the character and value of the land being taken into account. In later times this seems to have become the *karruvōn*, or hearth tax. The *amonā* was an additional impost for supporting the army and imperial officials; it was originally paid in produce. The province was divided into fiscal districts, and the total revenue to be derived from each was entered in a book of assessment. The assessment was in early times revised every 15 years (the "indiction" period), but subsequently such revisions seem to have been very irregular. The collection of the taxes was managed through the curial system, while it lasted (till 7th century?). The decurions, or municipal councillors, of the chief towns in each district were responsible for collecting and delivering the whole amount, and had to make good the sums owed by defaulters. This system of collective responsibility pressed very heavily on the decurions, and helped to cause their decay in the Western provinces. After the abolition of the curial organization, the principle of collective responsibility remained in the form of the *εὐρολόγος* or additional charge; that is, if a property was left without an owner, the taxes for which it was liable became an extra charge on the other members of the district. The taxes were collected by *praktōres*, who were under the general logothete. The peasant proprietors were also liable to burdens of other kinds, of which the most important was the furnishing of horses, vehicles, postboys, etc., for the State post (see ANGARIA).

The history of landed property and agrarian conditions in the Eastern empire still awaits a thorough examination. It may be noted that individual hereditary proprietorship was always the rule (on Crown and monastic lands as well as in other cases), and that the commonly supposed extensive existence of communities possessing land in common is based on erroneous inter-

pretation of documents. When imperial lands were granted to monasteries or as fiefs to individuals, the position and rights of the peasant proprietors on the estates were not changed, but in many cases the imposts were paid to the new master instead of to the fisc. In the 4th, 5th and 6th centuries the cultivators were attached to the soil (*coloni*, *ascriptici*; see *SERFDOM*), in the interests of the fiscus; it has been supposed, on insufficient grounds, that this serfdom was abolished for a time by Leo III., though it is probable that the condition of the peasants was largely changed by the invasions of the 7th century. In any case the system of compulsory attachment of peasants to their lands remained in force, and the class of *ascriptici* (*ἐναρτογράφοι*) existed till the latest times. The chief sources for agrarian conditions are, besides the imperial laws, monastic records, among which may be mentioned as specially valuable those of the monastery of Lembo near Smyrna.

MEANS OF DEFENCE

The general principle of the military defence of the empire in the 4th century consisted in large forces stationary on the frontiers, and reserve forces, stationed in the interior provinces, which could be moved to any point that was in danger. Thus the army was composed of (1) the *limitanei*, frontier-troops (under *duces*), and (2) reserve forces (under *magistri militum*) of two denominations, (a) *palatini* and (b) *comitatenses*. The *limitanei* were the more numerous; it has been estimated that if they numbered about 350,000, the *comitatenses* and *palatini* together amounted to less than 200,000. It is to be noted that for the old legion of 6,000 men a smaller legion of 1,000 had been substituted, and that the proportion of cavalry to infantry was small. In the 6th century the fundamental principles of the system were the same; but the cavalry had become a much more important branch of the service, and in the wars of Belisarius the *foederati*, barbarian mercenaries of various races, commanded by their own chiefs, played a great rôle. The peasants of Illyria and Thrace, the mountaineers of southern Asia Minor still supply an important part of the army, but the number of barbarians (Heruli, Vandals, Goths, Slavs, Arabs, etc.) is much larger. Solidity and a corresponding want of mobility characterized at this time both cavalry and infantry; their great merit was straight and rapid shooting: Belisarius ascribed his success in Italy to the excellence of the archery. It is remarkable with what small forces (not more than 25,000) the first conquest of Italy was achieved, though Belisarius was far from being a military genius and the discipline in his army was flagrantly defective.

Justinian carried out on the frontiers and in the exposed provinces a carefully devised and expensive system of defensive works. Fortified towns along the *limes* were connected by intervening forts, and at some distance behind was a second line of more important fortresses more strongly garrisoned, which furnished both a second barrier and places of refuge for the inhabitants of the open country. There was an elaborate system of signals by which the garrisons of the front stations could announce not only the imminence of a hostile invasion, but the number and character of the enemy. In North Africa there are abundant remains of the forts of the 6th and 7th centuries, displaying the military architecture of the period and the general frontier system. The typical fortress had three defences: the wall flanked by square towers of three storeys; at a few yards' distance a second wall of stone; and outside a deep foss about 20yd. wide, with vertical sides, filled with water, and along its edge a rampart of earth.

The Army.—We have already seen how the disasters and losses of the 7th century led to a radical change in the military organization, and how the empire was divided into themes. The preponderant influence which Asia Minor won and retained till the 11th century is reflected in the military establishment, which mainly depended on the Asiatic provinces. The *strategos* of a large theme commanded a corps of 10,000 and the scheme of the divisions and subordinate commands has a remarkable resemblance to the organization of some of the armies of modern Europe.

The recorded scheme was probably not uniform in all the

themes, and varied at different periods. The *Théma* (corps) consisted of 2 *turnai* (brigades) under *turnarchai*; the *turna* of 5 *banda* (regiments), each under a *drungarios* (colonel); the *bandon* of 5 *pentarkhiai* (companies) under a *komētēs* (captain). The *pentarkhia*, containing 200 men had 5 subdivisions under *pentekontarkhiai* (lieutenants); and there was a smaller unit of ten men under the *debarckhes* (corporal). The total strength in the 9th century was 120,000; in Justinian's time it was reckoned at 150,000.

Distinct from the military forces (*θῆματα*) of the provinces were the forces (*τῆματα*) stationed in or near the capital. The most important of these were the *scholæ* and the *excubitores*. The scholarian troops were in early times under the master of offices, but subsequently their chief officer, the domestic of the schools, became the highest military commander in the empire next to the *strategos* of the Anatolic theme. In war, when the emperor did not assume the chief command himself, he might entrust it to any commander, and he often entrusted it to the domestic. In the 11th century, after the conquest of Bulgaria, there were two domestics, one for the East and one for the West, and under Alexius Comnenus the domestic of the West received the title great domestic. Under the Palæologoi the great domestic was superior in rank to all other ministers.

Besides the scholarians and the *excubitores* (who had been organized in the 5th century), there were the regiments of the *lukanatoi*, the *arhthalmos* and the *numeroi*. The *numeroi* were foot-soldiers. The *optimatoi*, also infantry, properly belonged to the same category, though they were constituted as a theme. It is to be observed that the demes or corporations of Constantinople were partly organized as militia, and were available for purposes of defence.

The great difference between this Byzantine army and that of the earlier empire is that its strength (like that of the feudal armies of the West) lay entirely in cavalry, which the successors of Heraclius and the Isaurian emperors developed to great perfection. The few contingents of foot were subsidiary. The army was free from the want of discipline which was so notable in the 6th century; it was maintained in Asia Minor, which was the great recruiting ground, by a system of military holdings of land (an extension of the old Roman system of assigning lands in the frontier districts to federate barbarians and to veterans). The conditions of the marauding expeditions and guerilla warfare, continuously carried on against and by the Saracens in the 8th, 9th and 10th centuries, were carefully studied by generals and tacticians, and we possess the theory of the Byzantine methods in a treatise composed by the emperor Nicephorus Phocas, and edited by one of his pupils. Every detail of an inroad into Saracen territory is regulated.

In the 8th and 9th centuries there was a system of signals by which an approaching Saracen incursion was announced to Constantinople from the Cilician frontier. The news was flashed across Asia Minor by eight beacon fires. The first beacon was at Lulon (which commanded the pass between Tyana and the Cilician Gates), the last on Mt. Auxentius in Bithynia. When this fire appeared, a light was kindled in the pharos of the imperial palace at Constantinople. The system was discontinued in the reign of Michael III., probably after the capture of Lulon by the enemy in 860, and was not renewed, though Lulon was recovered in 877.

The loss of a great part of Asia Minor to the Seljuks, and the disorganization of the provinces which they did not acquire, seriously weakened the army, and the emperors had recourse more and more to foreign mercenaries and barbarian auxiliaries. The employment of Scandinavians had begun in the 10th century, and in 988 was formed the Varangian guard. In the arsenal of Venice are two lions, which were transported from the Pelraeus, inscribed with obscure Runic characters, carved perhaps by Scandinavians in the army of Basil II. Under Michael IV. the famous Norwegian prince Harald Hardrada (described by a Greek writer as "Araltes, son of the king of Varangia") fought for the empire in Sicily and in Bulgaria. But in the latter part of the 11th century foreign mercenaries greatly increased in numbers and importance.

The note of the Byzantine army was efficiency, and nowhere is the immeasurable superiority of the civilization of the Eastern empire to the contemporary States of Europe more apparent. The theory of military science was always studied and taught; constant practice, interpreting and correcting theories, safeguarded it against pedantry; and a class of magnificent staff officers were trained, who in the 10th century were the terror of the enemy. The particular tactics of the various foes whom they had to face were critically studied. We have a series of military text-books, from the time of Anastasius I. to that of Basil II., in which we can learn their principles and methods. In this army there was plenty of courage, and distinct professional pride, but no love of fighting for fighting's sake, nor the spirit which in western Europe developed into chivalry. The Byzantines despised such ideas as characteristic of barbarians who had physical strength and no brains. The object of a good general, as Leo VI. shows in his important treatise on Tactics, was in their opinion not to win a great battle, but to attain success without the risks and losses of a great battle. The same author criticizes the military character of the Franks. Paying a tribute to their fearlessness, he points out their want of discipline, the haphazard nature of their array and order of battle, their eagerness to attack before the word was given, their want of faculty for strategy or tactical combinations, their incapacity for operations on difficult ground, the ease with which they could be deceived by simple artifices, their carelessness in pitching camps, and their lack of a proper intelligence department. These criticisms, borne out by all we know of feudal warfare, illustrate the contrast between a Western host, with its three great "battles," rushing headlong at the foe, and the Byzantine army, with its large number of small units, co-operating in perfect harmony, under a commander who had been trained in military science, had a definite plan in his head, and could rely on all his subordinates for strict and intelligent obedience.

The Navy.—Under the early empire, as Rome had no rival in the Mediterranean, it was natural that the navy and naval theory should be neglected. When Constantine the Great decided to besiege Byzantium by sea, both he and his opponent Licinius had to create fleets for the struggle. Even when the Vandals in Africa made transmarine conquests and became a naval power, the Romans did not seriously address themselves to building an efficient navy. The Vandals harried their coasts; their expeditions against Africa failed. And even when the Vandal power was in its decline and Belisarius set forth on his successful expedition of conquest, his fears for the safety of his squadron in case he should be attacked at sea allow us to suspect that the fleet of the enemy was superior to the Roman. The conquest of Africa secured for Justinian the undisputed command of the Mediterranean, but he did nothing for the naval establishment. It was not till the Saracens, aspiring to conquer all the Mediterranean coastlands, became a naval power that the Roman empire was forced, in a struggle for its being, to organize an efficient fleet. This, as we saw, was the work of Constant II., and we saw what it achieved. In this first period (c. 650–720) the naval forces, designated as the *Karabisi-moi*, were placed under the command of an admiral, with title of *strategos*. They consisted of two geographical divisions, each under a *drungarios*: the province of the Cibyrhaeots (probably named from the smaller Cibyra in Pamphylia) which included the southern coast districts of Asia Minor, and the Aegean province, which embraced the islands and part of the west coast of Asia Minor. The former was the more important; the marines of this province were the hardy descendants of the pirates, whose subjugation had taxed the resources of the Roman Government in the last years of the republic. It was a new principle to impose the burden of naval defence on the coast and island districts. Distinct from these fleets, and probably organized on a different principle, was the naval contingent stationed at Constantinople. Leo III. changed the naval administration, abolishing the supreme command, and making the Cibyrhaeot and Aegean provinces separate independent themes under *strategoi*. The change was due to two motives. There was a danger lest a commander of the whole navy should become over powerful (indicated by the political rôle played by the navy before Leo's accession); but apart from this,

the general reform of Leo, which united civil and military powers in the same hands, naturally placed the commanders of the four branches of the navy on a new footing, by making them provincial governors. In this and the following reigns, the tendency was to neglect the fleet; the interest of the Government was concentrated on the army. For a time this policy was prosecuted with impunity, since the Omayyad dynasty was growing weak, and then under the Abbasids, who transferred the capital from Damascus to Baghdad, the sea-power of the caliphate declined. But the neglect of the fleet was avenged in the 9th century, when Crete and Sicily were wrested from the empire, the loss of south Italy was imminent, and Muslim squadrons sailed in the Adriatic—losses and dangers which led to a reorganization of the navy under Basil I. and Leo VI. After this reform we find the navy consisting of two main contingents: the imperial fleet (stationed at Constantinople), and the provincial fleets, three in number, of (a) Cibyrhaeot theme, (b) Aegean theme, (c) theme of Samos. A small distinct contingent was supplied by the Mardaites who, natives of Mt. Lebanon, had been transplanted (partly to Pamphylia, partly to Epirus, the Ionian islands and Peloponnesus). The imperial fleet seems to have consisted of about 100 warships manned by 23,000 marines (the same men fought and rowed); the provincial fleets of 77 warships manned by 17,000. When the fleets acted together, the admiral in supreme command for the time was called the "drungary of the naval forces." The warships (*δρόμους*, "dromons") were mainly biremes, but there were also uniremes, built for speed, called "galleys" (*γαλῆαι*). Pyrotechnic was an important department in the naval establishment; the manufacture of the terrible explosive known as *liquid* or *marine fire* (see GREEK FIRE) was carefully guarded as a State secret.

The navy, active and efficient in the 10th century, is described by a military and therefore unprejudiced officer of the 11th as the glory of Romania. But towards the end of the 11th century it declined, the main cause being the disorganization of the naval provinces of Asia Minor, which, as we saw, was a result of the Seljuk conquest of the interior. This decline had important indirect consequences; it led to the dependence of the empire on the Venetian navy in the struggle with the Norman power, and for this help Venice exacted commercial privileges which injured Byzantine commerce and opened the door to the preponderant influences of the Venetians in eastern trade. In the period of the Palaeologi the imperial navy, though small, was active; and the importance which it possessed for the State is illustrated by the high rank at court which the admiral (who in the 11th century had received the title of great duke, *μέγας δούξ*) then occupied; the only minister who was superior to him was the great domestic.

Diplomacy.—In protecting the State against the barbarians who surrounded it, diplomacy was a weapon as important in the eyes of the Byzantine Government as soldiers or fortifications. The peace on the frontiers was maintained not only by strong military defences, but by more or less skilful management of the frontier peoples. In the later empire this kind of diplomacy, which we may define as the *science of managing the barbarians*, was practised as a fine art; its full development was due to Justinian. Its methods fall under three general heads. (1) One people was kept in check by means of another. The imperial Government fomented rivalry and hatred among them. Thus Justinian kept the Gepidae in check by the Lombards, the Kuturgurs by the Utigurs, the Huns by the Avars. (2) Subsidies were given to the peoples on the frontiers, in return for which they undertook to defend the frontier adjacent to them, and to supply fighting men when called upon to do so. The chiefs received honours and decorations. Thus the Berber chiefs on the African border received a staff of silver, encrusted with gold, a silver diadem, white cloak, embroidered tunic, etc. More important potentates were invested with a costlier dress. In these investitures precedence was carefully observed. The chiefs thus received a definite position in the empire, and the rich robes, with the ceremony, appealed to their vanity. In some cases they were admitted to posts in the official hierarchy,—being created patricians, masters of soldiers, etc. They were extremely fond of such honours, and considered themselves half-Romans. Another mode of winning influence was to marry barbarian princes

to Roman wives, and rear their sons in the luxury of the palace. Dissatisfied pretenders, defeated candidates for kingship, were welcomed at Constantinople. Thus there were generally some princes, thoroughly under Byzantine influence, who at a favourable opportunity could be imposed on their compatriots. Throughout Justinian's reign there was a constant influx of foreign potentates to Constantinople, and he overwhelmed them with attentions, pompous ceremonies and valuable presents. (3) Both these methods were already familiar to the Roman Government, although Justinian employed them far more extensively and systematically than any of his predecessors. The third method was new and characteristic. The close connection of religion and politics at Constantinople prepares us to find that Christian propaganda should go hand-in-hand with conquest, and that the missionary should co-operate with the soldier. The missionary proved an excellent agent. The typical procedure is as follows. In the land which he undertakes to convert, the missionary endeavours to gain the confidence of the king and influential persons, and makes it a special object to enlist the sympathies of the women. If the king hesitates, it is suggested that he should visit New Rome. The attraction of this idea is irresistible, and when he comes to the capital, the pomp of his reception, the honours shown him by the emperor, and the splendour of the religious ceremonies overcome his last scruples. Thenceforward imperial influence is predominant in his dominion; priests become his advisers; a bishop is consecrated, dependent on the patriarch of Constantinople; and the barbarians are transformed by the penetration of Byzantine ideas. By the application of these various means, Justinian established Roman influence in Nubia, Ethiopia and south Arabia, in the Caucasian regions, and on the coast of the Euxine. The conversion of the Lazii (of Colchis) was specially notable, and that of the Sabiri, who were politically important because they commanded the eastern pass of the Caucasus known as the Caspian Gates. It will be observed that the great prestige of the empire was one of the conditions of the success of this policy.

The policy had, of course, its dangers, and was severely criticized by one of Justinian's contemporaries, the historian Procopius. Concessions encouraged greater demands; the riches of the empire were revealed. It was a system, of course, which could not be permanently successful without military power behind it, and of course it was not infallible; but in principle it was well-founded, and proved of immeasurable value.

In the 10th century we have again the means of observing how the Government conducted its foreign policy on carefully thought out principles. The empire was then exposed to constant danger from Bulgaria, to inroads of the Magyars, and to attacks of the Russians. The key to the diplomatic system, designed to meet these dangers, was the cultivation of friendly relations with the Petchenegs, who did not menace the provinces either by land or sea and could be incited to act against Russians, Bulgarians or Magyars. The system is explained in the treatise (known as *De administrando imperio*) composed by the emperor Constantine Porphyrogenitus (c. 950). The series of these northern States was completed by the kingdom of the Khazars (between the Caucasus and the Don), with which the empire had been in relation since the time of Heraclius, who, to win its co-operation against Persia, promised his daughter in marriage to the king. Afterwards the Khazars gave two empresses to New Rome (the wives of Justinian II. and Constantine V.). Their almost civilized State steered skilfully between the contending influences of Islam and Christianity, and its kings adopted the curious means of avoiding suspicion of partiality for either creed by embracing the neutral religion of the Jews. Commercial and political relations with the Khazars were maintained through the important outpost of the empire at Cherson in the Crimea, which had been allowed to retain its republican constitution under a president (*aprotelatos*) and a municipal board (*apokrates*), though this freedom was limited by the appointment of a *strategos* in 833, a moment at which the Khazars were seriously threatened by the Petchenegs. The danger to be feared from the Khazars was an attack upon Cherson, and it seems probable that this was a leading consideration with Leo III. when he wedded his son Constantine V. to a Khazar princess. In the 9th

century it was an object of the Government to maintain the Khazars (whose army consisted mainly of mercenaries) against the Petchenegs; and hence, if it should become necessary to hold the Khazars in check, the principle was to incite against them not the Petchenegs, but other less powerful neighbours, the Alans of the Caucasus, and the people of "Black Bulgaria" on the middle Volga (a State which survived till the Mongol conquest).

For this systematic diplomacy it was necessary to collect information about the peoples whom it concerned. The ambassadors sent to the homes of barbarous peoples reported everything of interest they could discover. We owe to Priscus a famous graphic account of the embassy which he accompanied to the court of Attila. We possess an account of an embassy sent to the Turks in central Asia in the second half of the 6th century, derived from an official report. Peter the Patrician in Justinian's reign drew up careful reports of his embassies to the Persian court. When foreign envoys came to Constantinople, information was elicited from them as to the history and domestic politics of their own countries. It can be shown that some of the accounts of the history and customs of neighbouring peoples, stored in the treatise of Constantine Porphyrogenitus referred to above (furnishing numerous facts not to be found anywhere else), were derived from barbarian ambassadors who visited Constantinople, and recorded by the imperial secretaries. We may conjecture with some probability that the famous system of the *Relazioni*, which the Venetian Government required from its ambassadors, goes back originally to Byzantine influence.

(J. B. B.)

ROMANES, GEORGE JOHN (1848-1894), British biologist, was born at Kingston, Canada, on May 20, 1848. He was educated at Gonville and Caius college, Cambridge, and early formed an intimate friendship with Charles Darwin, whose theories he did much during his life to popularize and support. When studying under Sir J. Burdon Sanderson at University college, London, in 1874-76, he began a series of researches on the nervous and locomotor systems of the Medusae and Echinodermata. The results were published in *Jelly-fish, Star-fish, and Sea-urchins* (1885). In 1879 Romanes was elected F.R.S. Meantime he had been also devoting his attention to broader problems of biology. In 1881 he published *Animal Intelligence*, and in 1883 *Mental Evolution in Animals*, in which he traced the parallel development of intelligence in the animal world and in man. He followed up this line of argument in 1888 with *Mental Evolution in Man*, in which he maintained the essential similarity of the reasoning processes in the higher animals and in man, applying Darwin's theory of evolution to the development of the mind. From 1886-90 Romanes delivered a course of lectures on "The Philosophy of Natural History" at Edinburgh, and was Fullerton professor of physiology at the Royal Institution from 1888 to 1891. In 1892 he brought out an *Examination of Weismannism*, in which he upheld the theory of the hereditability of acquired characters. In 1890 he settled at Oxford, where he founded a lectureship to be delivered annually on a scientific or literary topic. In 1893 he published the first part of *Darwin and after Darwin*, a work dealing with the development of the theory of organic evolution, and physiological selection, first propounded in a paper contributed to the Linnean Society in 1886, which provoked much controversy; a second part appeared in 1895 after his death, which occurred at Oxford on May 23, 1894; the third part is still unpublished.

His *Life and Letters*, by his widow, appeared in 1896; his essays were edited by C. L. Morgan (1897). He was also the author of a number of poems, a selection from which was published in 1896.

ROMANESQUE ARCHITECTURE: see BYZANTINE AND ROMANESQUE ARCHITECTURE.

ROMANESQUE ART. The term Romanesque is used in widely varying senses by different authorities. In general, it denotes the art and culture of Europe exclusive of the eastern empire and Russia, from the time of the fall of Rome (476) down to the development of Gothic art which occurred at various dates in different countries, but entirely between 1100 and 1300; in portions of Italy art remained dominantly Romanesque well into the 14th century. The attempt is sometimes made to limit the use of the word to the era following the Carolingian empire (800-987); this, however, causes undue difficulties of chronology and complexities in the identification of much work, so that the broader sense is both more true and more simple.

The dominant element in all Romanesque art is the attempt, increasingly successful with the passage of time, of peoples originally barbaric, brought gradually into touch with the ruins of a magnificent culture, and at the same time under the inclusive and unifying influence of an enthusiastic Christianity, to develop, for themselves, art forms which they could, with their own skill, create and which would satisfy their own emotional demands, so different both from those of the Roman empire and those of the cultivated and Christianized earlier Roman provinces. At first, this attempt was most evidently influenced by Roman art forms and produced caricatures of them; only in such long Christianized provinces as Gaul did some traces of the traditional, technical skill persist through the much troubled pre-Carolingian times. As time went on, however, not only did the fast growing skill of the former barbarians and the conquered peoples under them lead to an increasing freedom from the Roman models, but other influences crept in. Thus, by the beginning of the 12th century, there is evident in all Romanesque work throughout Europe a combination of differing tendencies and traditions whose varying proportions in different localities gave rise to the individual characteristics of different schools of art. These commingled influences may be briefly listed. The first, and still the most important, is Roman art; the fact that Rome was the centre of the Christian church at the time added to its power. The second element was Byzantine, for in Constantinople, throughout the dark ages, the manufacture of all sorts of objects of great beauty continued unabated; with the growing culture of the west, Byzantine and Syrian artists and craftsmen were in great demand and apparently large numbers of them were at work, at least in France. The third element is that which comes directly from the near east, especially Persia and Mesopotamia, through the medium of textiles which were among the most prized church decorations of the time and whose ornamental forms were copied alike in stone carvings and on manuscripts. The last element, which is the most difficult to analyze and evaluate, is the influence of the northern background of Lombard, Goth, Teuton and Celt. The intense vigour of Romanesque art, however crude, is evidence of the power of this influence; to it are also probably due the obvious love of beasts and some of the grotesque element.

This young and vigorous art found expression in many fields. In architecture new forms were developed which eventually gave birth to the Gothic style. (See *BYZANTINE AND ROMANESQUE ARCHITECTURE*.) The sculpture of the period is so largely architectural that separate treatment of it can only consider part of its purpose and effect. Up to the 12th century it is crude but tremendously alive. Unable to render the polished graciousness of classic forms, the early sculptor turned first to shallow imitations of Byzantine ornaments, and later naïve interpretations in stone of manuscript decorations and miniatures. Only in Italy, where some remnants of earlier skill seem to have persisted, there developed in the latter part of the 11th century any adequate sculptural technique. In Tuscany this seems to have been largely based on classic tradition, but in Lombardy there appears a mixture of Byzantine elements absorbed from Venetia and more vivid and naturalistic elements, at times strongly impregnated with grotesque feeling, more like the Romanesque across the Alps. Meanwhile, farther north, sculptural technique was rudimentary. Anglo-Saxon sculpture consisted of hardly more than scratchings on stone, and the earliest Norman work, both in France and England, is hardly more advanced. In Scandinavia

and countries in which a Scandinavian culture was imposed upon a Celtic background, as in Ireland, the Scottish islands and western England, a much greater skill appears; traditional Scandinavian and Celtic forms, such as the intricate interlaces, frequently based on dragon or snake forms, and much simplified human figures, often themselves worked into geometrical forms, are carved with brilliant decorative effect; the old Norse, pagan shapes merging with the new Christian symbolism, as in the famous stone crosses of England and Ireland.

During the 12th century there was an enormous change throughout Europe, as if, almost suddenly, latent decorative imagination and technical skill had come to maturity. Twelfth century sculpture, alike in France, Italy, Germany, Spain and England was accomplished, and at times, almost sophisticated. A blend of conventionalism and naturalism makes the porches of hundreds of churches beautiful examples of architectural sculpture.

In painting and mural decoration the influences at work were largely Byzantine. (See *BYZANTINE ART*.) Crude attempts to imitate Byzantine mosaic are found in much early Italian Romanesque work, and from manuscript accounts it would appear that similar attempts were once common in Romanesque churches farther west and north. Decorative painting shows also the dominance of Byzantine tradition into the 12th century; here, however, various local schools of illuminated manuscripts (*q.v.*) modified and freed mural decoration. Nevertheless, the chief aim was decorative rather than pictorial. Architectural members were richly patterned and wainscots painted with imitations of stone joints and hanging textiles, with little attempt at realism. Figures were painted flat, with little or no desire for light and shade, and arranged according to a purely decorative pattern; their size was frequently determined by relative importance or decorative necessity rather than any endeavour to achieve realism.

The Romanesque genius found one of its most congenial outlets in the decoration and illustration of books. As early as the 7th century, a vivid school of manuscript design had developed in Ireland and from there spread to the Scotch islands. The works of the school are marked by rich capitals, borders made of geometric interlaces, which often also cover the field of the page, and an occasional use of dragon's heads, birds and grotesque human figures. The complex beauty of these pages exerted a strong influence on later Romanesque work in many parts of Europe and Carolingian manuscripts show a combination of Celtic interlaces with classic motives and drawings inspired by late Roman manuscripts. Later, the intricate Celtic forms passed out of use, the Roman traditions were modified and naturalistic treatment appeared. By the beginning of the 12th century manuscripts in all the countries north of the Alps tended to resemble each other, and the figures show many of the characteristics of 12th century sculpture; the same dignity, decorative design and convincing emotional quality. Borders and ornamental initials had lost the intricate geometric shapes of the earlier period and the stylized leaves and flowers which were later to develop into the glories of Gothic illumination were beginning to appear.

South of the Alps manuscript decoration was following different lines. There, the influence of Byzantine manuscripts, with occasional reminiscences of classic work, remained dominant.

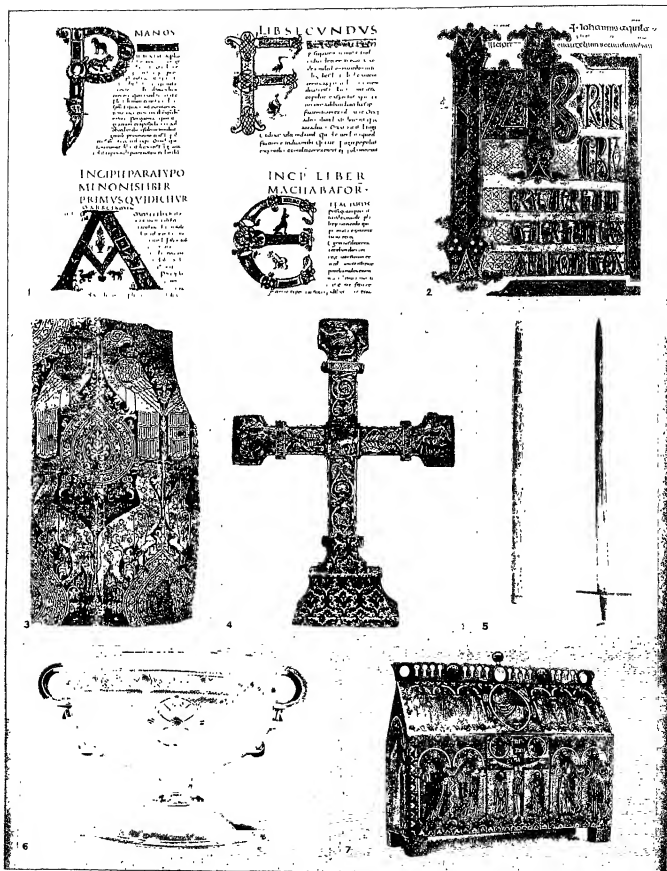

Romanesque metal work followed many of the same lines of development as Romanesque sculpture. In early work that of the Celtic countries was outstanding and magnificent silver-ware and jewellery were produced. Filigree (*q.v.*) was peculiarly congenial to the northern love of interlaces and complexities and was frequently applied, with excellent decorative effect, in small areas, to large, simple cups and chalices. (See *DRINKING VESSELS*.) Meanwhile, Byzantine church silver-ware and goldsmith's work was widely imported into Europe and exerted a strong influence upon the metal work of the later Romanesque times. (See *SILVERSMITHS' AND GOLDSMITHS' WORK*.) Particularly important was the development in France of a famous school of enamel workers, who worked both in *cloisonné* and *champlevé*. (See *ENAMEL*.) Little of the early wrought iron remains, but the exquisite workmanship and powerful design of many 12th century grilles, door hinges, etc., give evidence of a tradition which must have existed

ARCHITECTURAL DETAILS OF THE ROMANESQUE PERIOD

1. Celtic cross of limestone from Monasterboice, Ireland (900-923?)
2. Church of the Madeleine (restored) at Vézelay, in central France. Built about 1130 by the Benedictine order. Central door of the narthex (enclosed porch) looking into the nave. The circular doorway, richly carved, with columns of varied design and recessed arches, is characteristic of the French Romanesque style
3. Columns and spring of the arches of a doorway in the Abbey of St. Denis, near Paris, begun 1137. The carving of the shafts as well as of the capitals of the columns, and the use of sculptured figures in the recesses of the arches, are features typical of the Romanesque and early Gothic periods
4. A side door of the narthex in the Church of the Madeleine, Vézelay (see fig. 2)

APPLIED ARTS OF THE ROMANESQUE PERIOD

1. A portion of the illuminated manuscript of the Alouin Bible, English, 9th century. 2. An illuminated page from the "Lindisfarne Gospels" or the "Gospel of St. Cuthbert," English, about 700. 3. Reproduction of a Siolain brocade of the Norman period, (12th century). The design is in buff on a green ground, with the details in silver thread. 4. Processional

cross of silver repoussé work and parcel-gilt on a wood core. Designed by Seneola Guldtselvi, 12th century. 5. The (reputed) sword of Charlemagne in the Vienna Museum. 6. The chalice of Ardagh, of gold, 7" high; believed to be not later than the 10th century. 7. Reliquary or chalice of Limoges enamel (champlevé on copper). French, 12th or 13th century

for some time. In these 12th century examples the chief beauty comes from the expression of structure and the harmony of the decorative forms with their material. (See BRONZE AND BRASS.)

The popularity of Byzantine and Persian textiles in Romanesque Europe was a distinct hindrance to the formation of native schools of vital decorative textile design; in most cases products of Romanesque looms were the plainest and simplest materials for practical use. There was, on the other hand, a great deal of rich embroidery produced, of which the Bayeux tapestry (11th century) is the best known example. There are also, in many church sacristies, altar frontals and occasional vestments which reveal a similar skill in the medium and an even greater richness and decorative imagination. (See TEXTILES AND EMBROIDERIES; TAPESTRY.) (T. F. H.)

ROMAN LAW. The term "Roman law" is one of somewhat indefinite meaning. It denotes first of all the law of the city of Rome and of the Roman empire. This in itself is an enormously wide subject, for it includes, in the west, the law in force at any period from the foundation of the city (traditional date 753 B.C.) until the fall of the Western empire in the 5th century A.D., and in the east, can be taken to include the law of the Eastern empire, until it too fell with the capture of Constantinople by the Turks in 1453; for the law even of the later Eastern empire remained, in spite of changes, more Roman in character than most other branches of its civilization.

But "Roman law" does not mean merely the law of those political societies to which the name Roman may in some sense be applied, for the legal institutions evolved by the Romans have had, not merely influence on those of other peoples, but in many cases actual application, in times long after the disappearance of the Roman empire as a political entity, and even in countries which were never subject to Roman rule. Thus, to take the most striking example, in a large part of Germany until the adoption of a common code for the whole empire in 1900, the Roman law was in force as "subsidiary law," i.e., it was applied unless excluded by contrary local provisions. This law, however, which was in force in parts of Europe long after the fall of the Roman empire, was not the Roman law in its original form. Its basis was indeed always the *Corpus iuris civilis*, i.e., the codifying legislation of the Emperor Justinian (A.D. 527-565, see below), but from the eleventh century onwards (see GLOSS; IBERNUS, ACCURSUS) this legislation was interpreted, developed and adapted to later conditions by generations of jurists, and necessarily received additions from non-Roman sources. All the forms which it assumed in different countries and at different epochs can also claim to be included under the title "Roman law."¹

The importance of Roman law is, however, not confined to the actual application of its rules as such either in the Roman empire or elsewhere, for its influence on the development of law in general has been immense. Even to-day, if we look at the legal systems of peoples with a Western civilization, we can say that they fall (with some exceptions, especially the Scandinavian countries) into two groups—an English group, and a group in which the main elements are of Roman origin. To the English group belong England, nearly all the United States of America, and most of the British dominions and colonies; to the Roman group belong the rest. The nations of the Continent are, nearly all of them, living to-day under Codes which, though they contain much that is not Roman, are Roman in their structure, their fundamental categories and their general method of thought. Within the British empire there is Scotland with a system fundamentally Roman, Quebec with its French law, built largely with Roman materials, and South Africa which, like Ceylon, has a system known as "Roman-Dutch," that is to say based on the Roman law as developed by the jurists of the Netherlands. Even English law itself, though owing less to Roman law than any other system, has at different times and in different ways received considerable accessions from Roman sources. (See ENGLISH LAW; and e.g., Pollock and Maitland, *History of English Law* I. 88 seq.,

Holdsworth *History of English Law* II. 145-149, 176-178 IV. 228 seq.)

These developments however lie outside the scope of the article which is confined to the history of private law within the empire up to the death of Justinian.

Periods in the History of the Law.—Considerations of space make it impossible to discuss separately the different stages through which Roman law passed during the 13 centuries which elapsed between the foundation of the city and the death of Justinian, but some idea of the chief periods and their characteristics is essential for the understanding of what follows, and we may perhaps divide as follows:—

(a) *The Period of Conjecture.*—This includes the monarchy (753-510 B.C. according to tradition) and the republic up to the passing of the XII. Tables (451-450). For this period we have really no evidence but unreliable tradition and inference from later institutions

(b) *The Mid-Republican Period, from the XII. Tables Until About the Middle of the Second Century B.C.*—Apart from fragments of the Tables and from the historians, who are of course chiefly of use for constitutional law, our evidence is not a great deal better than for the previous period when it comes to detail, and the history of law, like the rest of Roman history, suffers still from the destruction of records when Rome was burnt by the Gauls in or about 387 B.C. However we know of some laws passed, of the existence of certain legal institutions and the names of some famous lawyers, though no professedly legal work has survived, and indeed few were written. The period is pre-eminently one of the *ius civile*, as opposed both to the *ius honorarium* or magisterial law and to the *ius gentium*, in the sense to be explained below.

(c) *The Late Republican Period.*—For the last century and a half of the republic the position as regards evidence is already different. A few quotations from legal writers of the time survive in Justinian's digest; we have Cicero, in all of whose works there are numerous references to legal matters, and we have other non-legal literature from which information on law can be deduced. We have too the text of a few laws in inscriptions. The period is that in which magisterial edict comes to be the chief reforming factor in Roman law and it may thus be described as the period of the earlier *ius honorarium*. It was also the period in which the *ius gentium* began to be of importance, and these two facts are not unconnected, for it was probably through the medium of the Edicts that a large part of the *ius gentium* found its way into the law as administered between citizens.

Ius gentium is a difficult phrase to explain, because it has two distinct, though related, meanings, the one practical, the other theoretical. In the practical sense it means that part of the Roman law which was applied by the Romans both to themselves and to foreigners, while *ius civile*, as opposed to it, means that part which the Romans applied only to themselves. This dichotomy can only be explained historically. Roman law like other ancient systems, adopted originally the principle of personality, i.e., that the law of the state applied only to its citizens. The foreigner was strictly rightless, and unless protected by some treaty between his state and Rome could be seized, like an ownerless piece of property, by any Roman. But from early times there were treaties with foreign states guaranteeing mutual protection, and even where there was no treaty, the increasing commercial interests of Rome made it necessary for her to protect, by some form of justice, the foreigners who came within her borders. Now a magistrate charged with the administration of such justice could not simply apply Roman law, because that was the privilege of citizens, and even had there not been this difficulty, the foreigners, especially those coming from Greek cities and used to a more developed and freer system, would probably have objected to the cumbersome formalism which characterized the early *ius civile*.

What the magistrate in fact did, was to apply a system composed of the already existing "law merchant" of the Mediterranean peoples and a strong Roman flavouring, the Roman element being, however, purged to a large extent of its formalist elements. This system was also adopted when Rome began to have

¹The term "civil law" is frequently used, in England at least, to denote the Roman system in this sense, as opposed to the native

provinces and her governors administered justice to the provincial *peregrini* (foreigners), a word which came to mean, not so much persons living under another government (of which, with the expansion of Roman power, there came to be fewer and fewer) as Roman subjects who were not citizens. The general principle adopted seems to have been to allow disputes between members of the same (subject) state to be settled by their own courts according to their own law, while the provincial courts applied *ius gentium* to disputes between the provincials of different states or between provincials and Romans. The law thus developed in its turn reacted on the law as administered between Romans, especially by way of making it less formal, with the result that to a considerable extent the two systems were identical, and this is true particularly of the law of contract. When therefore a Roman lawyer says that the contract of sale, for instance, is *iuris gentium*, he means that it is formed in the same way and has the same legal results whether the parties to it are citizens or not. This is the practical sense of *ius gentium*, but the idea is closely interwoven with a theoretical sense, that of a law common to all peoples and dictated by Nature which the Romans took from Greek philosophy.

Aristotle had already divided law into that which is natural (*φυσικόν*) and that which is man-made (*νομικόν*) and had asserted that the natural part was in force everywhere. This conception fitted well with the Stoic ideal of a life "according to nature," and became a commonplace which was borrowed by the Roman jurists, who, like other educated Romans, were much under the influence of the Stoic system. In their works this theoretical law of nature, "common to all mankind," then becomes identified with the really practical law which the Romans administered to all free men, irrespective of citizenship, simply on the basis of their freedom.

(d) *The Early Empire and the Classical Period.*—The change from republic to empire did not make any immediate difference to private law, except in so far as, bringing peace after a century of turmoil, it was favourable to legal progress. Legal literature, too, increased in volume and a number of quotations from authors of the first century survive in the Digest. This age in fact merges insensibly into the classical period, which is generally taken to include the second century A.D. and the early third century, and is thus considerably later than the classical period of Latin literature. It falls roughly into two divisions, an earlier one covered by the reigns of Hadrian (A.D. 117-138) and the Antonine emperors (death of Commodus A.D. 193) and a later one under the Severi (accession of Septimius Severus A.D. 193—death of Severus Alexander A.D. 235). Not that there is any break in the continuity of development, but the work of the earlier period was of a more creative character, while the later represents the working out of existing principles over the whole field of law. In the Digest there are quotations from all the authors of the classical age, but those taken from three writers of the later period (Papinian, Paul, Ulpian) alone comprise over half the work.

(e) *The Post-classical Period.*—With the era of confusion that followed the murder of Severus Alexander, there came a rather sudden falling off in the value of the legal work done, and the restoration of order by Diocletian (A.D. 284-305) did not revive legal literature. The law, of course, did not stand still. New ideas were introduced, especially from Greek sources, through the establishment of the Eastern empire with its capital at Constantinople, and through the growth of Christianity, while the great social and political changes of the sinking empire necessarily had their repercussions on private law. But it was not until the age just preceding Justinian that there was something of an intellectual revival in legal matters, and this revival Justinian was able to use for his great purpose.

SOURCES OF LAW

The Romans themselves divided their law into *ius scriptum* and *ius non scriptum*; by "unwritten law" they meant custom, by "written law," not only that derived from legislation, but, literally, that which was based on any source which was in writing and the list of written sources comprises *leges*, *plebiscita*, *senatus con-*

sulta, *edicta magistratuum*, *responsa prudentium* and *constitutiones principum*. This list is repeated in Justinian's Institutes though ever since the close of the classical period the only source of new law (apart from custom) had been the emperor's constitutions.

A. *Ius Non Scriptum* or Custom.—Custom (*mos maiorum*, *consuetudo*) was recognized by the Romans not only as having been the original source of their law, but as a source from which new law could spring. The theory given by the jurists is that the people, by adopting a custom, show tacitly what they wish to be law, just as they might do expressly by voting in the assembly. In the developed law it would seem, however, that custom as an independent source was not very fruitful, and that it exercised its influence rather through the medium of juristic opinion and the practice of the courts.

B. *Ius Scriptum.*—(1) *Leges and Plebiscita.*—*Lex* is properly an enactment of one of the assemblies of the whole Roman people, the *comitia centuriata*, *tributa* or *curiata* (see COMITIA), but the most ancient of these, the *comitia curiata*, ceased, before the beginning of reliable history, to have any real political functions, though it continued right up to classical times to exist for certain formal purposes. The validity of *plebiscita*, i.e., resolutions of the purely plebeian assembly, was one of the chief matters of contention between the patricians and plebeians, and the struggle between the orders may be said to come to an end in 287 B.C. when, by the *lex Hortensia*, *plebiscita* were given the force of *leges*. Thereafter enactments which were strictly *plebiscita* were often loosely referred to as *leges*.

Roman assemblies, like those of the Greek city states, were primary, i.e., the citizen came and voted himself and did not send a delegate, but their power was restricted by the rule that only a magistrate could put a proposal before them and by the absence of any opportunity for amendment or debate. The only function of the people was to answer "yes" or "no" to the magistrate's "asking" (*rogatio*), and constitutional practice further required that the magistrate should consult the senate before putting a proposal to the assembly. In the later republic, at any rate, rejection of a bill was practically unknown and the real power lay with the senate and the magistrates.

Leges Regiae.—The historians have a good deal to say of *leges* passed in the time of the kings, but legislation at so early a date is unlikely. What they took for laws were probably statements of ancient custom from pontifical sources.

The XII. Tables.—Of greater importance are the XII. Tables, said to have been passed in 451-450 B.C., some 60 years after the expulsion of the kings. The accounts given by the historians of their compilation (see ROMAN ANCIENT HISTORY: THE REPUBLIC) are inconsistent and mainly mythical, but tradition is no doubt right in representing it as an incident in the struggle of the plebeians for political equality. The moving cause was a desire to obtain a written and public code which patrician magistrates could not wrest at their will against plebeian litigants. What weight should be given to that part of the story which tells of a preliminary embassy sent to Athens to study the laws of Solon, has been much debated. That the embassy itself is legendary can hardly be doubted, but on the other hand, that there was some Greek influence is clear. (See, e.g., Tab. VII. 2-D. 10.1.13.) In the main, however, the materials of the code were taken from native customary sources. The authenticity of the whole compilation has been attacked in recent times, but the most authoritative modern opinion holds, in spite of all scepticism as to details, that the XII. Tables really were an enacted code of law, and that tradition is not far wrong in ascribing them to the middle of the fifth century B.C.

The text of the code has not survived, a remarkable fact, for copies (probably in more or less modernized language) must have been abundant in Cicero's time if, as he says (De Leg. 2, 23, 59) it was still customary in his youth for boys to learn it by heart. All that we have is a number of "fragments" which have had to be collected from allusions and quotations in the works of various authors, e.g., Cicero. (Modern collections are to be found in Bruns' *Fontes iuris Romani antiqui*, 7th ed., 1919, Girard's *Textes de droit Romain*, 5th ed., Paris, 1923, and Riccobono's

Fontes iuris Romani anteianiani.

On the establishment of the empire by Augustus, the assemblies did not immediately cease to function, but their assent to any proposal was a mere formal ratification of the emperor's wishes. The last *lex* known to have been passed was a *lex agraria* under Nerva (A.D. 96-98).

Senatus Consultum.—The senate acquired legislative power in early imperial times though this was never conferred on it by any imperial enactment. The resolution of the senate preceding the placing of a bill before the people had always been practically decisive, and with the decay of the *comitia* their assent evidently came to be regarded as a formality which might be omitted. Actually, the senate nearly always, if not always, legislated at the instigation of the emperor, latterly, indeed, simply embodying his *oratio* or proposal in a resolution, and not long after the classical period, the emperors ceased to use the senate as a vehicle of their legislation.

Edicta Magistratum.—An edict is a proclamation, originally no doubt oral, later in writing, and any superior magistrate might find it necessary to issue such edicts regarding matters which came within his competence. A peculiarity of Roman law, however, is that the magistrates entrusted with jurisdiction made particular use of this power and that their edicts became one of the most important sources of law. Originally the duty of *iurisdictio*, which means supervising the administration of justice rather than actually deciding cases (see p. 454, "Procedure") had presumably lain with the king, from whom it descended to the consuls. With the growth of business it became impossible for the consuls to discharge this duty in addition to their other functions and in 367 B.C. a new magistrate, the *praetor*, was appointed for the purpose. About the year 242 B.C. the increase of foreigners at Rome made it necessary to separate the conduct of suits in which they were concerned from those to which citizens alone were parties, and a second praetor, *praetor peregrinus*, was appointed to deal with cases in which a foreigner was involved. In contradistinction to him, the original praetor, now confined to suits between citizens, came to bear the title *urbanus*¹.

Other judicial officers at Rome whose edicts were of importance were the curule aediles, whose duties included the supervision of the market place. In the provinces supreme judicial power lay with the governors, and quaestors carried out functions analogous to those of the aediles at Rome. The law derived from the edicts of all these magistrates was called *ius honorarium*, as opposed to *ius civile* in the sense of law based on legislation or custom, but owing to the pre-eminent position of the praetors, the phrase is often used simply as equivalent to *ius praetorium*. The nature of this magisterial law is peculiar. The praetor was not a legislator, and he could not therefore make law directly as could the sovereign people, but the Roman system of procedure (especially the formula system, see p. 454) gave him a great power over the provision or refusal of remedies as well as over the form which remedies were to take, and consequently the edict which he issued at the beginning of his term of office setting out what he intended to do was a document of the greatest importance. In it he could say, for instance, "If one man makes such and such an allegation against another, I will give an action," even though the circumstances alleged would not give any right at civil law. The edict called *perpetuum* (continuous) because it was intended to announce the principles by which the praetor would be governed throughout his year of office, necessarily ceased to have any validity when that term expired, but it became the practice for each succeeding praetor to take over and reissue as his own much of his predecessor's edict, and by the end of the republic, the part which was thus carried on from year to year (*tralatitium*) must have been considerable, for jurists were just beginning to write commentaries on the edict, a practice which would not have been worth while if the greater part of it had been liable to annual alteration.

¹This is the usual story, but the historians in an endeavour to reconcile discordant tradition may have read back into early times the institutions of their own day. See E. Pais, *Ricerche sulla Storia*, etc. Serie iv. (1921), 265 seq.

The change from republic to empire did not immediately make any difference, and the praetors continued to issue their edicts (though we may doubt whether they ever made changes without imperial or senatorial authority), but in the long run their wide powers were evidently felt to be inconsistent with the emperor's supremacy. Hadrian consequently, in or about A.D. 131, instructed the famous jurist Salvius Iulianus to revise and settle the praetorian and aedilician edicts. The changes in substance do not appear to have been of a far-reaching character, but the edict as revised was henceforward made unalterable except by the emperor himself.

The relationship between *ius honorarium* and *ius civile* has often been compared with that existing in England between common law and equity. In both cases we find, as Maine put it (*Ancient Law*, p. 25) a "body of rules existing by the side of the original civil law, founded on distinct principles, and claiming incidentally to supersede the civil law in virtue of a superior sanctity inherent in these principles," and in both cases the resulting quality enormously complicates the law, but, of course, when we come to detail the comparison no longer holds.

Responsa Prudentium.—The force attributed to professional opinions of a certain type was another peculiar feature of the Roman system, and one which contributed in no small measure to its success, for it was the "learned lawyers" (*prudentes*) to whom the moulding of the law into a coherent system was really due.

Originally, according to an entirely credible tradition, law was considered the special province of the *pontifices* (see *PONTIFEX*), who seem to have regarded it as a mystery to be exploited in the interests of their order. Their monopoly was however broken down, according to legend, in 304 B.C., by Gn. Flavius, a clerk of Appius Claudius Caecus, who is said to have stolen from his master and made public, a list of *legis actiones* (i.e., forms of words which had to be followed exactly in the conduct of law-suits), thereafter known as the *ius Flavianum*. The first known legal treatise, called the "cradle of the law" by Pomponius, is the *Tripartita* of Sextus Aelius Paetus Catus (consul 198 B.C.) which contained the text of the XII Tables, the *interpretatio* put upon it by the jurists and the *legis actiones*. Probably the last part was identical with the *ius Aelianum* which, according to Pomponius, was a collection of *legis actiones* like the earlier *ius Flavianum*.

It is plain in any case that from about 300 B.C. onwards there came into existence a class of men who made the study of the law their special interest. These *iuris consulti* or *iuris prudentes* were not professional lawyers in the modern sense, but men of rank who sought by giving free legal advice to obtain popularity and advancement in a public career. The *responsa* (answers) which they delivered to those who consulted them were of greater weight than are our modern "opinions of counsel" because the person who actually decided a case under the Roman system of procedure was not, as with us, a trained lawyer, but a lay *iudex*, who did not, like our jurymen, have a judge to direct him on points of law. Augustus empowered certain jurists to give *responsa* with the emperor's authority, and this practice led, perhaps by insensible degrees, to the view that the *iudex* was bound to abide by the *responsum* of a jurist who had received this *ius respondendi*. Gaius at any rate mentions a rescript of Hadrian which laid down that *responsa* were binding if they agreed, and that if they disagreed, the *iudex* could decide for himself which to follow. (See Wlassak, *Die klassische Prozessformel*, p. 45.)

The practice of conferring the *ius respondendi* appears to have fallen into disuse about the end of the third century A.D. when the classical period was over, but in the meanwhile, *responsa* had certainly come to be regarded as binding not only for the case for which they were originally given, but also as precedents for future cases, and, further, authority gradually came to be attached to the other writings of those jurists who had the emperor's patent. The "law of citations," an imperial enactment of 426, ultimately laid down that only the works of five jurists, Papinian, Paul, Gaius, Ulpian and Modestinus, might be cited and, subject to some provisos which are obscure, the works of authors quoted

by these five. If the authorities cited disagreed, the majority was to be followed; if numbers were equal, the side on which Papinian stood was to prevail; if he was silent, the *index* might please himself.

For the long succession of jurists reference must be made to the individual authorities, but mention must be made here of the two "schools," the Sabinians (or Cassians) and the Proculians, into which they were divided in the early empire. Laeio (died between A.D. 10 and A.D. 22), one of the greatest figures in the history of jurisprudence, was the founder of the Proculians (who, however, took their name from a successor, Proculus); Capito, that of the Sabinians (so called from Massurius Sabinus, who was given the *ius respondendi* by Tiberius). What principles, if any, divided these schools, is unknown, though a number of controversies on particular points are preserved, especially in Gaius' Institutes. It is probable, though by no means certain, that there were teaching establishments or societies of some sort in connection with the "schools," for otherwise the list of "heads" given by Pomponius would be difficult to explain. The distinction does not seem to have survived the Antonine age; for Gaius, a Sabinian, is the last jurist of whom we know that he belonged to one or other of the schools.

Constitutiones Principum.—Neither Augustus nor his immediate successors expressly assumed legislative power, and yet Gaius, writing about A.D. 160, can say "there has never been any doubt that what the emperor lays down has the force of law." Ulpian, indeed, refers the validity of constitutions to the so-called *lex regia*, passed at the beginning of each emperor's reign; and there is indeed in the only surviving example of such a *lex* (the *lex de imperio Vespasiani* line 17 seq., see Bruns *Fontes* p. 202) a clause conferring such wide powers on the emperor that legislation might be deemed to be included. Nevertheless it is now generally held that this was not the original meaning of the clause and that the emperor's legislative power is a gradual growth. The chief forms of imperial legislation were:—(a) *Edicta*, i.e., proclamations which the emperor, like other magistrates, might issue; but whereas the other magistrates were confined to their own spheres, the sphere of the emperor was in fact unlimited. (b) *Mandata*, i.e., instructions to subordinates, especially provincial governors. (c) *Rescripta*, written answers to officials or others who have consulted the emperor, in particular on a point of law. In such cases the rescript lays down the point of law applicable and, since the emperor is supreme, the rule may be a new one. (d) *Decreta*, i.e., decisions of the emperor sitting as a judge. Here too the emperor may lay down a new rule.

The Earlier Collections of Constitutions and the Legislation of Justinian.—The growth of legal literature and especially of imperial constitutions created a need for works of reference which made itself felt long before Justinian, and a beginning was made, almost certainly in Diocletian's day, by a collection of constitutions known as the *codex Gregorianus*, which was followed by the *codex Hermogenianus*, perhaps also dating in its original form from Diocletian. Both collections were unofficial, but their compilers must have had official countenance, for they clearly had access to the imperial archives. The *Gregorianus* contained constitutions from Hadrian to Diocletian, the *Hermogenianus* almost exclusively those of Diocletian's time; later constitutions attributed to it were probably only added in subsequent editions. It was clearly intended to supplement the *Gregorianus*. Unlike these two, the *codex Theodosianus* was an official work compiled by a commission appointed under Theodosius II. and Valentinian III., it was given the force of law as from Jan. 1, 439. Constitutions from the time of Constantine the Great onwards were, with very few exceptions, not to be valid unless contained in it. For the earlier imperial legislation the older *codices* still had to serve. Nearly the whole of the *codex Theodosianus* has been preserved, whereas we only have fragments of the others. Theodosius had also planned a collection which would include juristic literature as well as imperial legislation, but this never came to fruition until it was taken up again by Justinian.

Justinian's Legislation.—(See also JUSTINIAN I.) Justinian's

main object was, as he himself expresses it, to clear the path of legal authorities of the tangles with which it had become overgrown during the course of centuries, and he set about the task almost immediately on ascending the throne. It must be noted however that he was no mere codifier, but also the author of much new legislation, some of which was of the utmost importance for the later development of law. The emperor was no doubt largely responsible himself for the work undertaken, but it would probably not have been possible to carry it through but for the genius of his chief minister, Tribonian, who was clearly the leading spirit throughout the work. The course of legislation was as follows:—

(1) *The Old Codex.*—In Feb. 528, a commission of ten members including Tribonian (who, however, was not president) was appointed to compile a new collection of imperial constitutions which was to supersede the older ones entirely and, of course, to include legislation subsequent to the Theodosian. The commissioners were to cut out repetitions and contradictions and had large powers of alteration for this purpose. The work was rapidly done and published in April 529, with the force of law as from the 16th. It has not survived as it was later superseded.

(2) *The "Fifty Decisions."*—Justinian, probably partly with a view to facilitating the work of compiling the Digest, issued a number of constitutions settling matters on which the writings of the classical jurists disagreed and abolishing finally some institutions and distinctions which had ceased to be of practical importance. Some 90 constitutions of this character are known to us, but a collection of 50 seems to have been made and published separately. Its exact date cannot be determined.

(3) *The Digest. (Digesta or Pandectae).*—Instructions were given on Dec. 15, 530, to Tribonian to form a commission to collect excerpts from the works of the jurists. The collection was to serve practical purposes and consequently everything obsolete or superfluous was to be cut out and, where necessary to bring the matter up to date, alterations were to be made in the text. The excerpts were to be arranged in fifty books and the books into titles according to the subject matter, and the whole was to include all that it was necessary to know of juristic as opposed to imperial law. The compilers were definitely instructed not to adopt the summary methods of the "law of citations" but where the authorities disagreed, to choose what they thought best for themselves. The commission, consisting of 16 members in addition to Tribonian, rapidly completed their task and the Digest was published on Dec. 16, 533, with the force of law as from Dec. 30. Thenceforth no reference might be made to any other text for juristic law. Justinian gives us some idea of the work involved when he says that 2,000 books consisting of 3,000,000 lines were read and that this number was then reduced to 150,000 lines. The Digest is the most important of Justinian's works, for in it are preserved the writings of the classical jurists who were really responsible for the greatness of Roman law, and the "inscription" at the head of each quotation enables us to see from which jurist and from which work it is taken. But of course as evidence for the classical law quotations must be used with care, for the compilers made considerable use of their powers of alteration; much ingenuity, especially within the last 50 years, has gone to the discovery of their "interpolations."

The Institutes.—The revision of the law by Justinian was accompanied by a detailed scheme for the reform of legal education in the universities of Constantinople and Berytus, and one of the requirements of this scheme was a new book to be used for elementary instruction instead of the Institutes of Gaius which had for centuries been the standard work. While the Digest was still unpublished therefore orders were given to Tribonian and two professors to compile a manual for this purpose, and the Institutes were published on Nov. 21, 533, and given the force of law. The work is based on Gaius' Institutes, from which a great part is copied literally, as well as on other elementary works of the classical period; occasional references to imperial legislation are added. It is in fact almost as much a compilation as the Digest, but the references to the authors quoted are omitted and the whole made to read like a lecture delivered by the emperor to his students.

The New Code (Codex Repetitae Praelectionis).—The 50 decisions and the many other new constitutions promulgated since 529 necessitated a revision of the old codex and Tribonian, together with four others, was instructed shortly after the publication of the Digest, to prepare a new edition. This was published on Nov. 16, 529, and given the force of law as from Dec. 29.

The Novels.—Although the new code completed Justinian's scheme for providing a collection of authoritative legal texts, he did not cease to introduce new legislation. In all 175 laws published after 529 are known and these are called *Novellae Constitutiones* or Novels. Nearly all are in Greek, which was becoming more and more the official as well as the spoken language of the Byzantine Empire. Justinian never made any official compilation of them, but three private collections have come down to us, and the Novels, together with the Institutes, the Digest and the (new) Code together form what is known as the *Corpus Iuris Civilis*.

THE LAW OF PERSONS

I. Slavery.—"The main distinction in the law of persons," says Gaius, "is that all men are either free or slaves." The slave according to Roman law was in principle a human chattel who could be owned and dealt with like any other piece of property. As a piece of property the slave was not only at the mercy of his owner, but rightless, and (apart from criminal law) dutyless. This is the principle, but if the slave was, in law, a thing, he was, in fact, a man, and this fact produced modifications of the principle. In particular, a slave might be manumitted and would then become in most cases not only free but a citizen.

II. Citizenship.—This was of importance for the purposes of private law, because certain parts of private law applied only to citizens (*ius civile*). The general rule was that, if the status of the parents differed, the child followed that of the father, if the union was one recognized as marriage by Roman law; otherwise that of his mother, but a *lex Minicia* of republican times enacted that in cases of unrecognized unions between citizens and foreigners the child should always follow the inferior parent. The great extension of the citizenship by Caracalla in A.D. 212 reduced the importance of this part of the law.

III. Family.—(a) *Patria potestas*. The chief characteristic of the Roman family is the famous *patria potestas* which the father exercised over his children and over his more remote descendants in the male line, whatever their age might be, as well as over those brought into the family by adoption—a very common practice at Rome. This meant originally not only that he had control over the persons of his children, amounting even to a right to inflict capital punishment, but that he alone had any rights in private laws. Thus any acquisitions made by a child under power became the property of the father. The father might indeed allow a child (as he might a slave) certain property (*peculium*) to treat as his own, but in the eye of the law it continued to belong to the father. In classical times there were already modifications of the system; the father's power of life and death had shrunk to that of slight chastisement, and the son could bind his father by contract with a third party within the same strict limits as applied to slaves and their masters. Sons too could keep as their own what they earned as soldiers (*peculium castrense*) and even make wills of it. In Justinian's day the position as regards property had changed considerably; what the father gave to the son still remained in law the father's property, but the rules of *peculium castrense* had been extended to many sorts of professional earnings (*pec. quasi castrense*) and in all other sorts of acquisitions (e.g., property inherited from the mother) the father's rights were reduced to a life-interest (*usufruct*). At all times *patria potestas* ceased normally only with the death of the father, but the father might voluntarily free the child by *emancipation*, and a daughter ceased to be under her father's *potestas* if she was married in such a way as to come under the *manus* of her husband.

(b) *Marriage*.—There were two types of marriage known to the law, one with *manus* and one without, but the former was rare already in the late republic and had disappeared long before Justinian's day. *Manus* was the autocratic power of the husband over the wife, corresponding to *patria potestas* over the sons, and

it might result in any of three ways:—

(1) by *confarreatio*, a religious ceremony confined to patricians.
(2) by *coemptio*, a type of *mancipatio* (see below) which was originally no doubt the Roman form of marriage by purchase; it was purely secular.

(3) *usus*; if a woman lived with a man as his wife for a year, he acquired *manus* over her by a kind of prescription. The XII. Tables had already provided that this might be prevented if the woman absented herself for a space of three nights during the year (*ususpatio trinoctii*). *Usus* was already quite obsolete in classical times.

It may be that at one time marriage with *manus* was the only form of union recognized as marriage at all, but by the time of the XII. Tables this was apparently no longer the case, for it is clear that the *ususpatio trinoctii*, though it prevented *manus*, left the marriage subsisting, so that it was possible to be married without *manus*.

In any case marriage without *manus* was by far the more common in all periods of which we have any real knowledge. It was formed (provided the parties were above the age of puberty and if under *potestas* had their fathers' consent) simply by the beginning of conjugal life with the intention of being married, and this was normally evidenced by the bringing of the bride to the bridegroom's house. It was however legally independent of all ceremonies whether pagan or Christian which might accompany it, and of consummation. The wife remained under her father's *potestas* if he were still alive, if he were dead, she continued (so long as guardianship of women continued) to have the same guardian as before marriage. It was necessary that both spouses should be citizens, or if one was not, that he or she should have *conubium*, the right given to some non-Romans of contracting a Roman marriage. The chief importance of this was that if a Roman contracted a union with a foreign woman, the children would not be in his *potestas* unless she had *conubium*. In marriage without *manus* the property of the spouses remained entirely distinct, and even gifts between husband and wife were invalid. It was usual however for a dowry to be given to the husband on the marriage by the woman or her father; this originally became the indefeasible property of the husband, but in classical times already the wife could recover it if the marriage ended by divorce or by the husband's death, and by Justinian's legislation it had always to be returned to the wife or her heirs.

Divorce was always possible at the instance of the husband in cases of marriage with *manus*, and in marriage without *manus* it was free to either party to put an end to the relationship at will; a letter of *repudium* was usual, but any manifestation of intention to end the relationship made clear to the other party and accompanied by actual parting was all that was legally necessary (see E. Levy, *Der Hergang bei der römischen Ehescheidung*). The Christian emperors imposed penalties on those who divorced without good reason, but the power of the parties to end the marriage by their own act was not taken away. *Concubinatus* was recognized in the empire as a sort of morganatic marriage, differing from marriage only by the different intentions of the parties, and excluding marriage, for a man could not have both a wife and a concubine. Constantine first enacted that the children of such unions might be legitimated by the subsequent marriage of their parents, a rule which the mediaeval civil law extended to all illegitimate children.

(c) *Guardianship*.—(1) Of children. Persons under the age of puberty (14 for males, 12 for females) needed *tutores* if they were not under *patria potestas*. Such tutors could be appointed under the will of the *pater familias*; failing such appointment the guardianship went to the nearest agnates (see p. 453 "Succession") until Justinian gave it to the next of kin whether agnatic or cognatic; if there were no qualified relation the magistrates made an appointment.
